When, from whom, and how this volume was obtained,
with the price paid, if any, may be found opposite
the above number in the Register of Books,
which is always open to inspection.

Extract from the Political Code.

SECTION 2296. Books may be taken from the Library
by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS
THEREOF, and by other State officers at any time.

SEC. 2298. The Controller, if notified by the Librarian
that any officer has failed to return books taken by him
within the time prescribed by the Rules, and after demand
made, must not draw his warrant for the salary of such
officer until the return is made, or three times the value
of the books, or of any injuries thereto, has been paid to
the Librarian.

SEC. 2299. Every person who injures or fails to return
any book taken is liable to the Librarian in three times
the value thereof.

No person shall take or detain from the General Library
more than two volumes at any one time, or for a longer
period than two weeks. BOOKS OF REFERENCE SHALL NOT
BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from
the Rules.]

The Foregoing Regulations will be strictly enforced.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,
Publishers.

SAN FRANCISCO, SATURDAY, JANUARY 2, 1886.

VOLUME LII
Number 1.

Calcination of Concentrates.

The immense copper matte product of Butte, M. T., is derived mainly from the concentrates obtained from the second-class ore. These usually contain about 20 per cent copper, 30 per cent sulphur and ten per cent silica, the balance being principally iron, and they are thoroughly calcined in long furnaces heated by wood, worked by two men on 12-hour shifts.

The calcining furnaces, which have been built under the supervision of E. D. Peters, Jr., are described by him as 64 feet by 16 feet outside, and have four hearths, each 14 feet long by 15 feet wide in the clear. The ore is charged from a hopper upon the hearth furthest from the grate, in quantities of 3600 pounds, and, in spite of the great length of the furnace, it is at a bright red heat in two hours.

Without going further into details, it may be stated that each furnace calcines 11 boxes of ore in 24 hours, reducing the percentage of sulphur from 30 to below 40 per cent, and consumes exactly two cords of pine wood. These results are so favorable that the cost of calcination is reduced to about as low a figure as one could hope to attain with a successful mechanical furnace. Care is taken to prevent the formation of sesquioxide of iron, it being almost infusible, and requiring a good deal of time and fuel before the reaction of the sulphides in charge reduces it to a protoxide and fits it for combining with the silica present. In a blast furnace, of course, the powerful reducing atmosphere accomplishes this result at once, but in the reverberatory smelting, which we are now discussing, the point mentioned is of sufficient importance to be always borne in mind.

The concentrates are discharged through a square hole in the hearth nearest the fire-place into an iron car, and are dumped over a high wall into a paved enclosure convenient to the smelting furnaces.

HOPEFUL FOR SILVER.—A dispatch of Tuesday from New York says: A notable change has come over the spirit of the silver opponents here and in other Eastern cities since the actual political and numerical strength of the question in Congress has been accurately defined. The abuse of the so-called silver ring and distortion of facts have yielded to more respectful treatment. The *Mail and Express*, hitherto a rabid goldbug, admits this evening that a change in the method of discussion is advisable. The *Philadelphia Press* this morning has also recognized the fact that the time for conciliation of the majority has come. It joins with the *Chicago Inter-Ocean* in deprecating sectionalism on the silver question. The *Evening Post's* trade and money article says: The silver scare last week disappeared about as quickly as it arose. To-day the nominal rates are \$6.86 for 60 day's sight and \$4.89 for demand bills. The actual market quotations are \$4.85 bid and \$4.85½ asked, and \$4.87½ bid and \$4.88 asked respectively. Business is limited, but nothing at the moment seems to indicate lower prices.

A MINERS' UNION has been organized on the north side of the San Joaquin river. Some of the mine owners are employing Chinese at underground work, and the Union will look after this matter and all the other interests of the miners.

Vanadate of Lead.

An item is going the rounds of the press to the effect that a mine of vanadate of lead has been found, and that the mineral is worth \$10,000 a pound. This lead mineral is properly called Descloizite, and is composed of lead, vanadium and oxygen. The expense of the article is due to its extreme rarity, but even

MINING WORKS DESTROYED.—On Wednesday morning last, very early, three masked men entered the engine room of the Marshall Coal Company's works at Erie, on the Colorado Central Railroad, 40 miles from Denver, captured the engineer, took him several hundred yards away and tied him. They then returned and set fire to all the coal on the dumps. The hoisting-works, engine house, tramway and sev-

UPRIGHT BOILER WITH SINGLE-ACTING ENGINE.

Single Acting Steam Engines.

The engraving on this page shows a form of upright boiler and engine, now being manufactured here by the San Francisco Tool Company. This company is the only maker of these single acting engines on this Coast, and keeps in stock several forms and sizes for different kinds of work. Engines of this class are now extensively employed for all kinds of purposes both in this country and in England, where they have been in regular use for twelve years past. They are in most respects a plain steam engine, without other novelty than having an extra cylinder and piston. They require no oiling, packing or adjusting like common engines, and cost no more according to their power.

The high speed of the engines with centrifugal pumps, dispenses with gearing and belts for pumping, the engine being connected directly to the pump shafts.

The shafts of the engines are made of steel and the connections of bronze. The valves are, in most cases, placed outside the main frame and accessible. The cylinders are jacketed, and every precaution taken to save steam and cost of running. The position of the valves and their working is not concealed and inaccessible, but in sight and adjustable. The wear of the valve and also of its connections can be taken up, otherwise the position would soon be lost.

The crank cases contain nothing but the cranks and piston connections, no governor, eccentric or other parts to break or come loose. The engines have no eccentrics, in the common sense of that term; the valves are driven by cranks. The steam valve is free to wear to its seat, as in the case of a common slide valve, and will not leak from wear.

Piston valve engines are furnished, in some cases, for very high speed and intermittent duty, and where engines are exposed to dust and grit; but are not recommended where oscillating valves will suit as well. Single acting engines will, no doubt, in the near future, take the place of the double acting type in most cases where condensing apparatus is not wanted. They should be examined by everyone desiring to erect steam power. The type shown in the engraving is a very compact one, and serviceable for various kinds of work. Everything about the boiler and engine is complete for work at once when purchased.

A BILL is to be introduced in Congress to lend the name of the Government to an International Exposition which is to be held in Chicago in 1892 to commemorate the four hundredth anniversary of the discovery of America. Chicago people are a good deal interested in this enterprise, and are going to push it with the energy that has made that city famous. The exposition will be planned after that of Philadelphia, and similar legislation is desired, except that no financial aid or guarantee is asked from the Government, the people of Chicago agreeing to foot all the bills.

THE Willamette Steam Mills of Portland, Oregon, have secured a contract for furnishing the lumber for the new bridge across the Missouri river at Omaha. That structure will be of iron and wood, and will cost some \$2,000,000.

then \$10,000 a pound is a high figure, to say the least. A high price ought to be secured from mineral collectors who desire to complete their collections, but any one who expects to get thousands of dollars a pound for it will find it rather difficult to dispose of any quantity. Vanadic oxide is, however, coming into use as a mordant in dyeing, an infinitesimal quantity being sufficient, in conjunction with an aniline dye, to produce a deep and permanent black. The mineral is valuable, but like other rare specimens of the mineral kingdom, only brings such prices as people will pay, and has no standard or fixed value in quantities.

eral cars of the railroad company were completely destroyed. The whole is valued at \$15,000. The destruction of the works throws several hundred men out of employment. Three weeks ago the wages of the men working in these mines were cut down, when a strike was ordered by the labor organization. The miners, rather than be without work at this time of year, refused to obey, and continued at work. The outrage is supposed to be another outcropping of the Rock Springs trouble.

FOUR mines at Leadville, Col., have paid over \$1,000,000 in dividends during the year.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—*Eds.*

Wickes, Montana.

(Written for the Press by our Traveling Correspondent,
R. G. HUSTON.)

Wickes is one of the prosperous mining camps tributary to Helena as a base of supplies, located 22 miles southeast of Helena, and is reached by a branch of the North Pacific railroad, from Prickley Pear junction, which makes one round trip a day from Helena, and accommodates the travel to and from Wickes, as it also does for the local travel to Boulder valley, Elk Horn and other points south of there. There is also a daily stage from Wickes to Butte. On this Wickes branch is the town of Clancy, at the junction of that creek with Prickley Pear, where the old Legal Tender silver mine is situated, one of the oldest as well as one of the richest in this Territory. The vein is very small—from four to ten inches at the largest, and choice ore running up to several thousand ounces silver to the ton. There are several other mines in this locality, but none of them have reached any prominence in mining circles.

The next station is Jefferson, which a short time since was the town of this county; but the reduction works at Wickes and the county seat at Boulder valley have given each town an advantage over their more ancient neighbor. One mile south of Jefferson is Corbin, where the concentrating works for the Alta mine are located. This concentrator is supplied with all the modern appliances for the purpose of extracting the mineral, and is kept running continuously on ore from this mine. They have lately opened out a larger ore body than they have ever had before, and also higher grade. The ore is at present transported from the mine to the mill, one and one-half miles by train, but it is the intention of the company to build another Huson tramway to transfer to the concentrator, from there to the reduction works. The concentrates are taken by rail four miles, and are then first taken to the reverberatory or calcining furnaces, and thence to the blast furnaces, where the bullion is extracted. The product of these two blast furnaces amounting to nearly a car load every day of 24 hours, makes a handsome return for the stockholders once a month, as the past dividends will prove. The Cornet mine, another property of the Helena Mining & Reduction Co., is located on one of the forks of Boulder creek over a divide from Wickes, four miles to the westward. This mine is one of those phenomenal discoveries that miners walk over and around for years before they are found. The miners working on the Rumly lead walked over this mine, and it was only covered by four or five inches of dirt for a long time. Finally a curious party happened to start a prospect hole in the right spot and struck an immense deposit of solid galena ores, and from that time on the Cornet mine has been worked, at first immensely rich and then poor; but now they have a large body of good concentrating ore.

They have a very complete concentrating plant here, and the concentrates are all transported over the mountain by one of the Huson tramways, nearly three miles long, taking the ore up to an altitude of 800 feet from the place of starting, and down the mountain on the other side to a point 1500 feet below the divide. The most of this is done by the weight, the tram being an endless wire cable running over pulleys supported by staunch uprights, and iron buckets fastened to this wire cable every 60 or 70 feet. This is loaded automatically with from 250 to 350 pounds of concentrates or free milling ore, as the case may be. There is a small 12-horse-power engine connected with it to help start it, and that is about all it needs is starting. It is also dumped automatically, and they can easily send 100 tons over in 10 hours' work, at an expense of about \$13. Before putting up this tramway it cost them \$4 per ton—quite a difference in the favor of the stockholders. They intend next season to extend this through to the works at Wickes, as there is no reasonable doubt but that it will work successfully for that distance. On the mine they have just finished very fine hoisting works on their new three-compartment shaft, which will now enable them to get out ore enough to keep everything running to its full capacity. Their hoisting apparatus previously used was too small to accomplish this. The these reduction works were Eastern men, and parties owning these mines and that built many things they did the present company have been compelled to undo; and many of their theories, whilst they were good on paper, would not operate a mine and reduction works successfully. Notably among these were the building of a company chapel, and shutting down the works on Sunday, and compelling all hands to attend service in chapel on Sunday. These are all well enough, but at least the company did not succeed, and, as a matter of fact, with all this gigantic mining plant and two good mines open they lost money—reports say a cool million. The present company have an efficient corps of men in charge, and that it is ably and capably handled is best proved by the fact that every month there is a dividend to be

distributed among the fortunate stockholders of nearly \$20,000.

Besides handling their own mine product the Reduction Co. also work custom ore. They either sample it and buy it out or work it for a stipulated amount per ton.

They have two blast furnaces, eight calcining or reverberatory furnaces, 25 stamps, six Bruckner cylinders, six amalgamating saws and three settlers. The worst feature of the location of their works is their lack of dump for the refuse from the furnaces, although the Railroad Company are helping considerable by taking away many carloads of slag for ballast for their road at different points. They have also six large charcoal furnaces, each of which when charged will turn out nearly 2000 bushels of charcoal, of which they have to use a large amount. There is a large number of other locations in this vicinity. One of these, the Emmet lead, has a shaft down 180 feet. They have an engine to hoist and dump on this mine, and are determined to develop a mine. The Reduction Co. in their two mines and works must give employment to at least 600 men or more. This makes them contribute very largely to the prosperity of this section of the county. The business men of the town seems to be drifting along very comfortably. I am inclined to think that it becomes chronic for the business men of a town to cry dull times. Probably it is from a fear that some impecunious newspaper man will ask them to advertise, subscribe and pay in advance or want them to loan him money enough to get out of town on. I don't know which of these reasons to ascribe it to, but think it is chronic any way.

The Gregory mine is located three miles north of Wickes on a prong of Clancy creek, near the junction, and is a good property. It has been worked for several years, is owned and operated by the same company that own the Glister mine in Lewis and Clarke counties, under the name of Gregory Consolidated. The mill and works have been shut down for a short time for repairs, and they have also been sinking a new shaft and putting in a different hoist. That the mine is a good one is evidenced by the fact that they had just finished shipping nearly 200 tons of bullion. Their bullion is of much higher grade than the Alta and Cornet, containing a much larger percentage of silver. This mine and works give employment to at least 125 men, and many more are at work in the vicinity.

The Canyon Creek District.

(Written for the Press by Our Traveling Correspondent,
R. G. HUSTON.)

This district is located some 35 miles northwest from Helena, Montana, and is reached by the Lincoln Gulch stage running three times a week. The Homestake is on Virginia creek, a tributary of Canyon creek, and is the best developed property in the district—in fact the only one that has a mill. The ore is free-milling gold and silver, and they work it to an average of \$75 per ton. The ledge runs from one to two feet in width, and, of course, is giving its owners full satisfaction. They employ 15 men, and are working in a modest manner and making money. The mine is owned by Mr. Henry Jacob and some Helena parties.

West of this location is the Grubstake. The ore is of the same character, and they have worked quite a large amount of it at the Jacob mill. They are now running a tunnel to strike their lead 100 feet deeper than they have heretofore worked it. What they have worked has paid much the same as that of the Homestake.

East of the Homestake is the Batchelor. The proprietors have run a tunnel and tapped the lead 160 feet from the surface, and find it from 18 inches to three feet wide, and it looks so well that they have refused an offer of \$60,000 for the property, which shows that they have confidence that they have a good mine.

The next east is the Alpha and Omega, whose owners have run a tunnel and tapped the lead at 175 feet from the surface, and have run levels each way 70 or 80 feet. They also crushed some of the surface ore that averaged them \$35 per ton. They have just bonded the property to Sanford & Evans, of Helena, for \$60,000. There is no doubt but it is a good property. There are many other locations in this district, but these are the principal ones that are developed to any extent.

Mineral and Metalliferous Veins.

EDITORS PRESS:—In your issue of Dec. 5th, there appears an article from Mr. Blackburn treating of "mineral and metalliferous veins" in which he argues that fissures are usually caused by "foldings or wrinklins of the earth's crust produced by contraction of its interior." I think it would be difficult for Mr. Blackburn or any one else to explain logically how such effects could be produced by the cause which he alleges. In speaking of how the fissures were filled he says: "Their contents have been deposited from hot alkaline waters, holding the various mineral substances in solution. At Steamboat Springs near Virginia City, there may be observed ocular disproof of the correctness of Mr. Blackburn's speculations. It may there be

seen that at some time subsequent to the drift period there began a flow of hot springs at the summit of the western border of Shallow valley, the waters of which on cooling formed a continuous rocky deposit of considerable length parallel to the direction of the valley. In course of time, as the accumulation extended over the soil toward the lower part of the valley, the weight became so great as to cause the soil on the outer edge to yield and let the rock there sink, so as to produce fissures farther back, by fracture, parallel with the direction of the valley. At this time the roaring of hoiling water may be heard deep down in those fissures, while steam is continually ascending through them to the surface, and being condensed on the sides of the fissures produces a smooth, white, crystalline surface, entirely different in appearance from the matter which the same waters formed by sedimentary deposition. I am persuaded that these springs afford an illustration of the manner in which vertical mineral veins have chiefly been formed, at least in the mode of filling.

JUSTIN CHENOWETH.
San Francisco, Dec. 25, 1885.

Hints for Lubricating.

(Written for the Press.)

There is a most erroneous impression extant in regard to danger of fire from the use of petroleum oils for lubricating, and yet there is not a case on record of fire from the use of petroleum lubricants, or even of fire originating in them while stored. The reason of the impression is that there are numerous accidents from the use of kerosene and coal oil, and as it is known that these oils are obtained from petroleum, everything in the shape of mineral oil has been condemned. The frequent conflagrations in oil refineries, and the fact that numerous oil companies refuse to insure and cannot afford to on account of the high rate demanded, assist to deepen the reluctance with which petroleum oil is regarded.

All the danger of petroleum is in its distillation, a process which comes before and prepares the oil for the latter processes which make it a lubricant. The crude oil when taken from the earth is subjected to heat at various temperatures until its inflammable vapors are all carried off and condensed into the various oils known to commerce as naphtha, benzine, kerosene, etc. After this process has been completed, the remainder of the oil is used and treated for lubricating purposes. It is as harmless as a bee with the sting removed. It can't be set afire unless special effort is made to that end. Blazing sticks can be plunged into it and it will extinguish them like water. Look at the big fire in Brooklyn, N. Y., recently, when a manufactory of lubricating oils caught fire from a neighboring block. The oil, both in complete packages and in unheated barrels was found intact after the flames had been subdued, with the exception of the staves being almost completely burned through.

If any reader will try and set a barrel of cylinder oil on fire he will see how difficult a job he has undertaken. On the other hand, upon taneous combustion, or what is generally understood to be that, has occurred again and again from the use of lard, cotton-seed, castor and olive oils.

CHARLES J. WOODBURY.

123 California St., S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HORSE COLLAR.—Sylvester B. Davis, Eureka, Humboldt Co., Cal. No. 331,871. Dated Dec. 8, 1885. This improvement in horse collars consists in loosely hinging or suspending shoulder-pads from the neck-pad by means of hame-irons, so that the pads may have a freedom of movement and adjust themselves to the varying position of the horse's shoulders. It also consists in the manner of attaching the tugs or trace to the pads and a means for adjusting the size of the collar.

CARTRIDGE-PACK.—J. C. Kelton, S. F. No. 331,891. Dated Dec. 5, 1885. This invention relates to a means for rapidly reloading the chambers of revolvers, and it consists of cartridges secured together as to be in line with the chambers of the revolver, into which they can all be instantly inserted and the holding device removed. This pack affords a means by which the chamber of the Smith & Wesson and similar constructed pistols can be loaded simultaneously. Six chambers of the revolver may be loaded with this device, General Shelton says, in four seconds. The need of such a pack for certain and rapid loading is absolutely necessary in war, and especially where the pistol is used in hand-to-hand combat, where success depends upon the rapidity with which the pistol can be reloaded and discharged.

TWO-WHEELED VEHICLE.—John A. Gallagher, Stockton. No. 331,957. Dated Dec. 8, 1885. This improvement in "carts" consists in an extensible pivoted connection between the loosely-hung, swinging or pivoted body and the axle, by which the body is prevented from moving backward or forward, while the springs

are allowed to have their own proper spring action, and also the tetering motion received from the shafts without transmitting said motion to the body. The object is to overcome the unpleasant motion of a cart, due to the "joggling" of the horse. This invention contemplates such a connection between the loosely-suspended or pivoted body or axle, by which, while the springs are given their freedom of motion, the body is prevented from moving back and forth with them, while it moves up and down with the spring action.

ROTARY CUTTER FOR DREDGERS.—John H. Bolles, assignee of one-third to John S. Williams, San Francisco. The invention relates to certain new and useful improvements in rotary cutters for dredging machines, in which an outer drum, carrying the hockets, rotates on an inner drum, provided with a reservoir communicating with the suction pipe and the buckets; and the invention consists of a peculiar and novel construction and arrangement of the buckets and in a rotary adjustment of the inner drum. This cutter is specially adapted for use on the dredger invented by Mr. Williams, and described in another paragraph under this heading.

FEED-WATER PURIFIER.—A. J. Stevens, Sacramento, No. 331,917. Dated, Dec. 8, 1885. This feed water purifier for steam boilers consists of an inner shell into which water is admitted, and within which it is heated so as to rise to the top, where it passes through perforations into an exterior inclosing-shell, between which and the inner one it descends, passing through holes in the bottom of the annular space into the boiler. A perforated blow-off pipe extends along the bottom of the inner chamber and through this the deposited sediment may be discharged from time to time by means of a suitable cock. Mr. Stevens, the accomplished master mechanic of the C. P. R. R., who is the inventor of the device, has adapted it particularly for the use of locomotives.

DREDGE.—J. N. S. Williams, assignor of two-thirds to John H. Bolles. S. F. No. 331,929. Dated Dec. 8, 1885. The invention relates to the class of dredging machines of that type known as suction dredgers, in which the material is disintegrated by suitable machinery, and the spoil, together with quantities of water, is carried up through a centrifugal pump and deposited at varying distances, as may be required. The invention consists, in connection with a rotary cutter of suitable form adapted to be adjusted through arcs in horizontal and vertical planes of a suction pipe from the cutter, having a ball-and-socket pipe and a telescopic joint, whereby said pipe may move radially and axially, conforming to the adjustment of the cutter, and a peculiar system of gearing by which the power is transmitted from the engine to the lay-shaft driving the cutter, the gears of said system being adapted to maintain their work throughout all the adjustments of the cutter. The invention consists further, in a novel arrangement and method of using a system of spuds, by which the boat or scow is held.

CHECK-REIN ATTACHMENT.—John C. Kelton, S. F. No. 331,892. Dated Dec. 8, 1885. This check-rein is especially useful for cavalry horses to enable cavalrymen to use both hands in mounted firing while the horses are in motion, and for hard-mouthed or restless horses in general. It consists of an india-rubber tube containing a spring introduced on each branch of the curb-rein, and contracting with a strength sufficient for the purpose. When used for cavalry horses, each trooper, knowing the amount of pressure his horse should have at a gallop, limits his stride to that gait by drawing back the rein-upon starting and fixing the curb at the proper point, and fastening it over the pommel of the saddle, thus effecting the control needed. It then only remains for the trooper with another rein to guide his horse, having both hands free to handle his carbine while firing and loading. By this means the perfect alignment of a cavalry force may be maintained in a charge, when perfect array is absolutely essential for success. The play of the spring affords the horse such movement of his head as not to hamper in going over uneven ground, in jumping, or in case he stumbles and falls. Horses hard to control, or harness, or in mounting under the saddle, when the pressure on the bite is apt to be relaxed, can with this rein be brought to subjection.

EXPRESS MONEY ORDERS.—Wells, Fargo & Co.'s Express have opened a money order department, which it claims reaches a greater number of places than any other west of the Mississippi and Missouri rivers. It requires no application blank; is payable to "bearer" or to "order" as desired, and can be cashed at banks. In case an order should be lost the money will be refunded. Five cents is the charge for \$1 to \$5; eight cents is the charge over \$5 to \$10. These orders are sold throughout the States and Territories west of the Mississippi and Missouri rivers. At hundreds of these places there is neither money order post-office or bank.

ACCORDING to the San Jacinto Register, in a large canyon on the east side of San Jacinto mountain, numerous fan palms have been found, many of which are 50 to 80 feet in height. The trees are also said to be loaded with fruit, which the Indians in that locality subsist upon.

MECHANICAL PROGRESS.

A New Method of Producing Solid Steel.

The Société des Acieries de Longwy, at Longwy, France, has brought forward a new method for the manufacture of solid steel castings which is to be based upon the observations made during the past few years on the causes of blow-holes and the examination of the composition of the masses in them. These masses, it is now well known, consist of carbonic oxide, hydrogen and nitrogen. The hydrogen is increased by the blowing in of air containing moisture and the decomposition of the latter, the nitrogen simply by contact of the air blown through. The fact that hydrogen remains intact in so strongly oxidizing a current of air can only be explained by the circumstance that the intensity of the decomposition of water is increased by the high temperature. It is certain, however, that hydrogen and nitrogen are expelled when they are brought into contact with dissolved oxide of iron instead of with free oxygen. Until now the presence of oxide dissolved has been considered injurious to the working of steel. Difficult experiments have led to the conclusion that both Bessemer pig and Thomas pig, when tapped from the furnace, hold in solution at the same temperature closely equal quantities of gases of nearly identical composition. In casting steel after it has been decarbonized, but before it has been either recarbonized or overblown to remove phosphorus, gas escapes during cooling. After recarbonizing the metal in the acid Bessemer process, it is observed that a mixture of gases escape which is substantially identical in composition with that coming from the pig-iron originally used in the operation. On an average, it is composed of 40 per cent of carbonic acid, 50 per cent of hydrogen, and 10 per cent of nitrogen. This points to the fact that if the blowing led to an increase in the relative quantity of hydrogen and nitrogen in the metal, then the carbonic oxide generated by the reaction between dissolved oxide of iron and the recarbonizer sufficed to restore the same proportion of the gases in the mixture.

The case is quite different with steel produced by the basic process. In this case there is in the bath of metal a very large quantity of dissolved oxide of iron, formed during the after-blow for the elimination of phosphorus. When the recarbonizer is added the mass is strongly agitated by the escape of carbonic oxide. This mechanical action aids the reaction between the oxide of iron and the hydrogen. Therefore, relatively, the quantities of hydrogen and nitrogen in the cooling ingots of basic steel are much less than those produced by the acid process, the percentage of carbonic oxide in the escaping gas being greater. Averages of analyses show that the gas escaping during the casting of basic steel was composed of 80 per cent of carbonic oxide, 10 per cent of hydrogen and 10 per cent of nitrogen, while the gas escaping during the chilling of the ingot contained 60 per cent of carbonic oxide, 30 per cent of hydrogen and 10 per cent of nitrogen.

If it be conceded that blowholes are due principally to the bubbles of hydrogen and nitrogen caught in chilling in the act of escaping, and secondly, by carbonic oxide bubbles under similar circumstances, then the means are provided for making solid castings. If a lively generation of carbonic oxide has the result of mechanically removing occluded hydrogen and nitrogen as F. G. C. Mueller held as one of the results of his investigations—then the generation of that carbonic oxide is desirable. This is obtained by overblowing the metal, thus bringing it into oxide of iron, which, when coming into contact with the recarbonizer, generates carbonic acid. The Longwy method therefore calls for overblowing both in the acid and in the basic converter. The overblown steel is run into an open-hearth furnace. In the latter the chemical action between the oxide of iron and the occluded hydrogen is depended upon to bring about the elimination of the latter.

It appears that the Longwy metallurgists appear to hold the view that hydrogen and nitrogen have entered into some sort of compound with the iron, which is decomposed through the action of the oxide of iron. It is somewhat difficult to share that view, which seems to rest on a very flimsy foundation, chemically. They add also a very siliceous slag as a protection against the gases and as means of decomposing the oxide of iron. Then they add the recarbonizer, pig iron containing silicon and carbon. The generation of carbonic oxide is looked to complete the elimination of the hydrogen and nitrogen, and then, when the bath has quieted down completely, spiegel-eisen or ferromanganese is added in order to get into the metal the needed quantity of manganese to facilitate the rolling of the product. We incline to the view expressed by Mueller that the removal of hydrogen is best accomplished by a violent foal reaction through the addition of a recarbonizer to the overblown metal, and it is probably wisest to use a metal as recarbonizer which is low in silicon. The only use which casting into an open-hearth furnace could be looked upon to have would be the keeping of the bath in so fluid a condition for so long a time that there would be no danger of entangling escaping bubbles of carbonic oxide gas in it—that is, until a dead melt

had been reached. The Longwy people claim that by their process they can cast even the smallest ingots solid.

INVENTIONS BY EMPLOYEES.—It is universally admitted that the people of the United States are *par excellence* a nation of inventions. The *London Globe* says of the "American": "His natural ingenuity, fighting against the artificial enhancement of prices, has driven him to seek relief in mechanical assistance. . . . Every workman in a manufacturing coater is stimulated to study and master the machine under his charge with a view to improving it. Mechanical invention is part of the character of the nation, etc."

Our English contemporary is correct, and it would be highly interesting could a history be written of the successful inventions which have been introduced by workmen while engaged in the regular course of their employment. It would be a history replete with stirring incidents, and enlivened with tales of poor men suddenly lifted to riches and influence, of revolutions in industrial methods, and of changes which often border on the domains of the marvelous. The factory is indeed a school, and from it have graduated many of the brightest and most useful geniuses of the age.

BRITTLE BOILER PLATES.—Boiler plates, after considerable use, says the *Age of Steel*, are frequently found to be almost as brittle as cast iron; in fact, many are in that condition before being used; but when this condition is brought about by use, it is perhaps owing to its absorbing sulphur from the coal; and possibly the common grades combine with sulphur more readily than good iron (when some of this iron is tested by breaking it looks as if it needed sulphur or something to fill up the chinks). It is notorious that sheet-iron chimneys used about mines and other places where sulphury coal or slack is used, are even up and destroyed in next to no time at all, and as a matter of course the boilers get their share of it. I have seen boilers channeled along the seams where there are no leaks, and where it could only have been caused by sulphur or some other product of combustion. As long as only channeling occurs, the danger is not great if the engineer is watchful, but when the sheet becomes brittle also unequal strains produce cracks, and when the crack is once started and pressure enough to open it, the enormously increasing volume of steam, due to the suddenly relieved pressure, is sufficient to do the rest, and the explosion is complete.

GENESIS OF THE CUT NAIL.—Now that cut nails, made of iron, are finding their market disputed by cut nails made of steel, with probability that this tendency will steadily increase as steel nails and their merits become better known, it is interesting to look back to the early days when cut nails first began to dispute the market with the hand made variety. Credit for making the first cut nails is claimed as far back as some years prior to 1790, for the firm then known as J. G. Pierson & Bro., doing business on the spot now known as No. 24 Broadway, New York City. The firm consisted of Josiah G. and Jeremiah H. Pierson, respectively grandfather and granduncle of Henry L. Pierson, Jr., now senior member of the iron firm of Pierson & Co., located at 24 West street, New York, which firm only removed from No. 24 Broadway a year or so ago. In the year 1790 J. G. Pierson & Bro. removed their cut nail works to Ramapo, N. Y., just over the Jersey line, where they carried on the business upon a large scale until the year 1830.—*American Machinist*.

PAPER RAILS.—According to the *Organ des Mines*, of Paris, the paper rail is to become a practical reality. That journal states that a company is about to establish large works for making rails from paper near St. Petersburg. The paper is subjected to great pressure, and it is said that the material is extremely durable, and can be produced at one-third the cost of steel rails. A further advantage would be in their lightness, not only on account of the saving of the cost of carriage and laying, but also because they could be made in longer lengths than is the case at the present time, therefore the number of joints will be fewer, and consequently less oscillation to the carriages, and the wear and tear to both permanent way and rolling stock reduced to a minimum. A greater adhesion also would be offered by these rails to the driving-wheels of the engine, and the working expenses reduced accordingly.

FASTENING A BELT.—A correspondent of the *Woodworker* says about fastening a belt: "After quite a good experience with a great many ways of joining, I must say that above all others I prefer lapping and riveting, and I will give my reasons therefor. First, and above all other things, a riveted joint is the cheapest. I don't mean cemented and riveted, but lapped and riveted, taking care to skive nicely, so that the joint will not be clumsy, making the scarf according to the size of the belt. Do not scarf the ends down too thin; if you do the rivets will be likely to tear out. A little practice in this style of fastening a belt will make you do a nice job, and if you once get used to it I will warrant that you will never use any other method. It takes no more time, if as much, as it does to either lace or hook a belt with any device I have ever seen, and I have seen a great many. This style of fastening should be used all over the mill, whether driving belts or not."

SCIENTIFIC PROGRESS.

Electricity Direct from Burning Coal.

We have already made reference to the exhibition of an electric motor shown at the late International Inventors Exhibition at London, where the electricity was obtained and utilized directly from the combustion of coal without the intervention of a steam engine or any other motor. This invention was pronounced a decided step in advance in utilizing electricity, by which, as claimed below, nearly three times the work can be obtained from coal than can be realized from burning it under a steam boiler in the ordinary way of producing electricity. The device was exhibited by Mr. J. A. Kendall, of North Ormsby, Middlesbrough, and as described by the *London Engineer* as follows:

The battery is based upon the well-known phenomenon of hydrogen passing through platinum at a red heat, two platinum plates being used as the poles, one exposed to hydrogen and the other to oxygen. These plates are arranged in the form of concentric tubes closed at one end, and are separated by a fluid medium of fused glass. Hydrogen gas is continuously supplied to the inner platinum tube, while the entire apparatus is maintained at a high temperature by means of a furnace fed with coke or liquid or gaseous fuel. The absorption of hydrogen by the platinum is accompanied by electric generation, and the current is led away by wires connected with the platinum tubes. It is curious, however, that so long as the two platinum tubes are not connected by a metallic circuit, the passage of the hydrogen is slow, but that as soon as the electric circuit is completed, the rate of flow is suddenly increased, and is steadily maintained at the higher amount. In the case of a group of cells or battery, the same gas-furnace may be used to heat the series. The cells are connected for quantity and intensity as in the voltaic battery. The electromotive force of a cell is given by Mr. Kendall as about 0.7 volt. This is, of course, much less than the theoretical electromotive force of a hydrogen and oxygen couple, and the remaining energy evolved by the combination appears to be developed in the form of heat at the surface of the oxygen plate, and serves to keep up the temperature of the apparatus. In the action of the battery, the hydrogen, in passing through the inner tube, is, so to speak, filtered off from any gases with which it may be mixed. The residual combustible gases, if any, when drawn off by the escape-jet, can be utilized as fuel for the furnace. This is a very valuable feature, as it enables the battery to be worked with strong producer gas, consisting mainly of hydrogen and carbonic oxide, and to be arranged in a very compact way, the spare heat left from heating the cells being available for working the producer. Mr. Kendall proposes to employ it for a variety of purposes—for example, the driving of electric launches and so on. With the new generator, all that is required to maintain the working is a supply of fuel and a little water.

The inventor estimates that a ton of coke used in heating the battery, including the hydrogen producer, will give at least three times the electric energy that would be produced by the same quantity of coke used in working a steam engine and dynamo. It is also hoped by the inventor to develop the new process of electric generation for lighting purposes. Houses can in this way be lighted by incandescent lamps by means of coal gas supplied to the premises, and larger centers of illumination could be economically worked by the use of ordinary fuel, such as coal and coke.

A NEGLECTED PLACE FOR RESEARCH.—There is a good opportunity for some one to make a valuable record as a geographical explorer from a hitherto neglected point of departure on the western coast of Africa—say from Monrovia to the Niger, to determine and secure its productive resources. The Government of the United States has dispatched expeditions to the Arctic regions, the Dead Sea, Japan and South America for scientific and commercial purposes. Why not send a party to explore the region above alluded to? A naval officer of high rank, and who has won distinction by his successful efforts to extend American commerce, has already volunteered his services to lead in so important a survey. An appropriation by Congress of \$25,000 should be made in this behalf, to be expended under the direction of the Secretary of the Navy. The people of the United States can claim Liberia alone as their part of Africa. Why not utilize their position there for the advancement of science and our own as well as the world's commerce? Such an expedition would cost but little, and would, in all probability, be of more value to the world than half a dozen Arctic expeditions, in view of what we already know of those regions.

THE VELOCITY OF THE MOON MADE MANIFEST.—We can faintly picture, says Prof. Langley, how it would seem if we were placed at a station in space near the lunar orbit, and could see the moon, a moving world, rush by us with a velocity greater than that of a cannon-ball in its swiftest flight. This feeling may be almost realized, in fact, by witnessing from some high mountain the shadow of the moon as it passes swiftly by during an eclipse. At such a time, its shadow actually

with the same speed of its flight in space. The observer upon some lofty point, from which his vision reaches many miles to the west, can easily discern and follow the approaching shadow, and witnessing the actual velocity of a heavenly body, as it were, brought down to him.

Such a sight may be witnessed during an eclipse of the sun by an observer stationed upon any high eminence on the eastern flank of the Sierras, which may overlook the adjacent plains for say 40 or 50 miles.

An observer, Mr. Forbes, once obtained such a view from the Superga, at Turin. It was an almost cloudless day, when, just as the eclipse came on, he says: "I perceived in the south-west a black shadow, like that of a storm about to break, which obscured the Alps. It was the lunar shadow coming toward us. I confess it was the most terrifying sight I ever saw. As always happens in cases of sudden, silent, unexpected movements, the spectator confounds the real and relative motions. I felt almost giddy for a moment, as though the massive building under me bowed on the side of the coming eclipse." Another witness, who had been looking at some bright clouds just before, says: "The bright cloud I saw distinctly put out like a candle. The rapidity of the shadow and the intensity produced a feeling that something material was sweeping the earth at a speed perfectly frightful. I involuntarily listened for the rushing noise of a mighty wind."

BONES TURNING TO LIVER LIKE TISSUE.—One of the most remarkable causes of death on record recently occurred to a man near Chicago. George Buck, a young man, who, in health, measured five feet eight inches in height, but whose length, after death, was but four feet seven inches, died of a peculiar disease, which called for a post mortem examination. His body, besides being reduced 13 inches in length, was so collapsed and flattened, that the chest bone and spinal column almost touched. "Here," said the physician to a reporter, who was present, "is a cross section of the right femur. There is not a particle of bone in that. What was bone is now blood-red matter that resembles liver in its normal state. In this condition we found every bone in his body. The cranium resembled a football, inasmuch as any portion could be pushed in and then it would resume its shape again. This red matter, which has taken the place of bone structure, I am not yet able to say what it is, but will make a microscopic examination and report to the medical journals. As to the organs of the body, I found the right lung crowded up under the clavicle. The left lung was almost as fast up, and was affected with pleurisy. Otherwise they were normal, though somewhat atrophied. There was congestion of the liver. The spleen and pancreas were about one-half the normal size and lighter in color than usual. The kidneys were slightly enlarged, indurated, and contained bony deposits of calcareous matter."

SIGNS OF TYPHOONS.—The Government astronomer of Hong-kong has published an account of the phenomena which precede typhoons. The first signs are feathery clouds in the sky of the cirrus type, looking like fine tufts of white wool, and which travel from east to north. These appearances are accompanied by a slight rise of the barometer, clear weather, heat and light winds. The barometer then begins to fall; the heat becomes oppressive; there is a swell on the sea, and the sky assumes a threatening appearance. As the storm approaches, these effects become more marked, while the wind gradually increases in force. Near the center of the storm the wind blows with such violence that no canvas can hold against it, and the rain pours down in torrents. Still nearer the center, the sea is lashed into such fury that this is the most dangerous position for ships. Typhoons are most common during September and August, but they are met with all the year round.

SHAPE OF THE EARTH'S ORBIT.—Proctor remarks that a common error is the supposition that the earth moves in an obviously elliptical path, whereas it really appears to travel in a circle. Taking the earth's orbit when its eccentricity was very nearly at its greatest—\$50,000 years ago—the numbers 325 and 324 represent the actual proportion between the greatest and shortest axes of the figure described by our planet's motion around the sun. So that if a circle is drawn with a radius of three and one-fourth inches, it nowhere departs more than the hundredth part of an inch from the ellipse which would represent with perfect accuracy the orbit of the earth \$50,000 years ago, when it was so much more divergent from an exactly circular form than now.

THE BROOKLYN BRIDGE CABLE.—Tests made of the Brooklyn bridge cables show that they are all magnetized. The bottom parts of all pieces of iron show north polarity, and the cables of the bridge are said to be magnetized in the direction of their diameter, the upper surface of the cables throughout their length being of south polarity and lower surface north.

A LUMINOUS TREE.—There is a small tree growing in a gulch near Tascara, Nevada, the foliage of which at certain seasons is said to be so luminous that it can be distinguished a mile away in the darkest night. In its immediate season it emits sufficient light to enable a person to read the finest print. Its luminosity is said to be due to parasites.

SAN FRANCISCO:

Saturday Morning, Jan. 2, 1886.

TABLE OF CONTENTS.

EDITORIALS.—Chlorination of Concentrates; Single Acting Steam Engines; Vanadate of Lead, 1. Passing Events; Expenditures on Separate Claims; Foundry Notes; More Mines to be Re-worked, 4. Electrical Activity of Ore Bodies; Boiler Explosion at Lake Mead; Winifred District, Arizona, 5.

ILLUSTRATIONS.—Upright Boiler with Single-Acting Engine, 1. Fig. 1.—Terminal, Longitudinal Section; Fig. 2.—Terminal in Position, 5.

CORRESPONDENCE.—Wickes, Montana: The Canyon Creek District; Mineral and Metalliferous Veins; Hints for Lubricating, 2.

MECHANICAL PROGRESS.—A New Method of Producing Solid Steel; Inventions by Employees; Brittle Boiler Plates; Genesis of the Cut Nail; Paper Rails; Fastening a Belt, 3.

SCIENTIFIC PROGRESS.—Electricity Direct from Burning Coal; A Neglected Place for Research; The Velocity of the Moon Made Manifest; Bones Turning to Liver Lake Tissue; Signs of Typhoid; Shape of the Earth's Orbit; The Brooklyn Bridge Cable; A Luminous Tree, 3.

USEFUL INFORMATION.—Metallic Carriage Wheels; Paper-Hangings and Curtains from Leather; An Ocean Steamer's Provisions; How Trees Die; To Detect Fire Damp; Power from Shafting; Leading Occupations, 7.

GOOD HEALTH.—Overcoat "Colds"; Death from Carelessness; Alcohol and its Uses; Causes of Disease; Danger from Hydrogen in Zinc Dust, 7.

MISCELLANEOUS.—Notices of Recent Patents, 7. Practical Hydraulics, 6. Lead Smelting—No. 4, 7.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 8-9.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 16.

Business Announcements.

Passing Events.

As we begin a new volume of the PRESS with this number, it is hoped that all those who have been our readers for the past year will end in their subscriptions for this one, and lend us their assistance also in inducing others to subscribe.

There seems to be considerable of a mining boom now going on in Oregon, and numbers of new mines are being opened. There is a large section of that State which has hardly been prospected, and the men who have ventured in those regions of late have been doing well.

The quartz mining interests of California are in better condition than for years past. From all parts we hear of old mines being reopened and work being vigorously prosecuted on new ones.

Although the PRESS this week is dated the 2d of January, it is not too late to wish our readers a "Happy and Prosperous New Year."

A COLORADO company is putting up sampling works in Butte, where ores may be sampled and sold. These mine owners who are not sufficiently well fixed to treat their own ores will have an opportunity of ascertaining accurately their value, after which they can sell to the highest bidder. It is an enterprise which will undoubtedly be of great benefit to the class of mine owners mentioned.

THE Oro Grands mill at Calico, is keeping a 15-stamp mill at work.

Expenditures on Separate Claims.

A very interesting decision has been made by the Secretary of the Interior on this question of required expenditure on claims which have been located separately, but which are afterward consolidated and owned by one individual or company. The claim in question is a placer, in this State, and the commissioner of the General Land Office declined to recognize the application for a patent because it was not shown or alleged that \$500 had been expended for the development of each separate original location embraced in the application. The company appealed from this decision to the Secretary of the Interior, who reverses the decision and allows the company to proceed with its application upon showing compliance with the law to date of renewal of such proceedings.

The points brought out in this decision are of interest and importance to those who are desirous of patenting placer claims. The claim covers 140 acres. The location was made by the Good Return Mining Company and six individuals, the latter afterward conveying their individual interests to the company. When they applied for patent this application was rejected under the clause of the Department circular to the effect that "If an individual becomes the purchaser and possessor of several separate claims of 20 acres each, or less, he can include all in his application (if not over 160 acres), but upon each of the original claims or locations he or his grantors must have expended \$500 in improvements." They then refused to file the claim.

It appears that the original locations had been made years ago when the laws did not require them to be placed on record, and they had relocated them in order to apply for a patent. The Land Commissioner held, however, that they must show proof of the \$500 expenditure on each separate claim. The owners then denied that the Department circular had any authority, and that the law really required only \$500 on the entire claim embraced in the application.

The provisions of law for expenditure on mining claims, are in Sections 2324 and 2325 of the Revised Statutes. It is not necessary to quote them here at length, but after speaking of the required annual labor, one of the sections says, "but where such claims are held in common, such expenditure may be made on one claim," etc. The last section requires, on application for patent, that proof of \$500 expenditure must be filed.

The Secretary, in his decision says, that the broad question presented by the appeal, is whether or not the expenditure required to be shown by Section 2325, must be like that required by Section 2324, be so great as to amount to the whole specified sum for each location or discovery claim embraced in the application.

The circular instructions assume that such is the law; and to properly decide the point, requires close analysis of the statute as construed by the highest judicial tribunals. As to Section 2324, the case of Jackson vs. Roby, (109, U. S., 440), establishes the doctrine that the annual expenditure to the amount of \$100 to be done on each location, claim, or for its benefit, must be made on placer as well as lode claims.

This case, as well as that of Chambers vs. Harrington (111 U. S. 353) also holds that the showing must be made to the jury that such work, or at least some work, must have been done on it for the benefit of each discovery claim, in order to hold the same from relocation, and sustain the right of possession in an application for a patent. In the latter case, after referring to the complete security of promissory rights under mining regulations, where no patent is sought, the following language is used.

These mineral lands being thus open to the occupation of all discoverers, one of the first necessities of a mining neighborhood was to make rules by which this right of occupation should be governed as among themselves; and it was soon discovered that the same person would mark out many claims of discovery, and then leave them for an indefinite length of time without further development, and without actual possession, and seek in this manner to exclude others from availing themselves of the abandoned mine. To remedy this evil, a mining regulation was adopted that some work should be done on each claim in every year, or it would be treated as abandoned.

"In the statutes we are considering, Congress,

when it came to regulate these matters and provide for granting a title to claimants, adopted the prevalent rule as to claims asserted prior to the statute; and as to those made afterwards, it required one hundred dollars' worth of labor or improvement to be made in each year on every claim. Clearly this purpose was the same as in the matter of similar regulations by the miners, namely, to require every person who asserted an exclusive right to his discovery or claims to expend something of labor or value on it as evidence of his good faith, and to show that he was not acting on the principles of the dog in the manger.

"When several claims are held in common, it is in the line of this policy to allow the necessary work to keep them all alive to be done on one of them. But obviously on this one the expenditure of money or labor must equal in value that which would be required of all the claims if they were separate or independent."

In this case there were three successively acquired claims supposed to be located on the same lode. The amount of \$300 was found by the court to have been expended by locating the main shaft on one, during the year in which the abandonment of another of said claims was alleged, which work was also found by the court to have been done for the benefit of the three, and the title was sustained against an attempted re-location of part of the ground.

The Secretary of the Interior draws from these cases the conclusions:

1. That when application is made for patent upon a mining claim embracing several locations, an adverse claimant may prove abandonment of any one of such locations by failure to make annual expenditure upon it, or upon a common claim for its benefit, and the possessory right will fail, even though the adverse claimant may not show in himself a good adverse claim by reason of a like failure. And this accords with the Act of March 3, 1881. (21 Stat., 505.)

2. That compliance "with the term of this chapter, as a condition for the making of application for patent according to Section 2325, requires the preliminary showing of work or expenditure upon each location, sufficient to the maintenance of possession under Section 2324, either by showing the full amount for the pending year, or if there has been failure, it should be shown that work has been resumed, so as to prevent relocation by adverse parties after abandonments.

This renders unnecessary any extended review of the provision of Section 2325, requiring the further showing, "that five hundred dollars' worth of labor has been expended or improvements made upon the claim by himself or his grantors." This is not saying that in any case at least that amount shall have been expended to entitle him to patent, though for a single location one hundred dollars per year would protect the possessory right. That more than one such location may be embraced in an application for patent is clear from the cases quoted, and also from Smelting Company vs. Kemp, (104 U. S., 636) where the question was directly brought in issue, and wherein all these terms "location," "claim," "mining claim," etc., are elaborately discussed, and specifically defined, and wherein the distinction is very clearly drawn between the limitations upon the quantity that may be embraced in one location, and that which may be included in a single patent, and the often variant and different meanings of the words "claim" and "mining claim" are cited and distinguished. The construction of Sections 2324 and 2325 on this point must be considered by these decisions as settled: wherefrom it follows that as Section 2325 only directs proof of expenditure to the amount of five hundred dollars by certificate of the Surveyor General on the claim embraced in the application for patent, it must be error to hold that it further requires that amount on each individual original location, in lieu of the amount already provided for by Section 2324.

The Secretary of the Interior thinks the circular instructions of Dec. 9, 1882, and the first requirement of the circular of June 8, 1883 under which these applicants were rejected, are erroneous, and he now overrules them. With respect to the ruling in the present case, that it was not competent for the Good Return Mining Company to relocate the claim purchased from parties who many years ago made locations which were never recorded and never adjusted to the public surveys, such relocation

having been made, so far as shown by the allegations, not for the purpose of evading annual expenditure, but for better and legal description, and in order to enable the owner to proceed and obtain patent, the Secretary is of the opinion that said ruling is not well grounded in law and works essential hardship. There is nothing to indicate whether the original discovery was before or after 1872. Nor is there any showing as to the number of original discovery claims, and annual expenditures upon each so as to prevent its relocation by anybody "in the same manner as if no location of the same had ever been made." If no location had ever been made, the manner of this location and recording was precisely in accordance with law. It conforms to the requirements of Sections 2329, 2330 and 2331, respecting placers upon surveyed lands. The Secretary sees no objection to the receipt and publication of the application as a basis for entry, subject to the filing of adverse claims and the usual proceedings, as in other cases.

Mine owners will be pleased at the tenor of this decision, relieving them, as it does, in certain cases, of unnecessary expense.

More Mines to be Re-worked.

A group of mines, 34 in number, situated near Aurora, Esmeralda county, Nevada, has lately been taken by an English syndicate of London, England. A company has been formed, called the Esmeralda Consolidated (limited) of London; capital, £500,000. The parties owning the properties accept paid up shares of the company, instead of cash.

Thirty of these mines are gold-producing, the remainder principally silver. Some of these mines were worked a number of years since, and about \$14,000,000 extracted. Some have been simply prospected, and tunnels run into them.

A group of twelve mines are called the New Esmeralda properties; eight are known as the Middle hill mines; six are on Martinez hill; others are the Humboldt, Humboldt West, Del Monte, Wide-west, and Pond, on Last Chance hill, Esmeralda and two extensions thereof. The last named mines yield principally silver. A large brick mill, originally built for the Antelope mine and which cost over \$200,000, is included in the purchase.

Mr. Alfred E. Ann, of London, is the promoter of the company, and the reports of the experts engaged by him, among whom was Mr. P. N. Mackay, mining engineer, well known on the Comstock, are very satisfactory.

The mill will be ready for work in about 60 days, when active operations will be commenced. Three hundred and seventy-five thousand dollars has been put up by the company for working capital.

Foundry Notes.

The Pacific Iron Works, though by no means running to their full capacity, have lately been turning out a very considerable amount and variety of mining machinery, some of the principal orders being as follows: A ten-stamp gold mill for the Southern Belle Mining Co. of Arizona, with pumping machinery, including 9000 feet of pipe; a five stamp mill for the J. H. Berger mine of Arizona; chloridizing furnaces and dryers for the Iron Mountain Mining Co.; chloridizing furnaces for the Giant Mining Co., of Nevada; pans, settlers, etc., for the Silver King Co. of Arizona; hoisting works for the Starlight Co. of El Dorado; hoisting works for the St. Louis & Yavapai Co. of Arizona; a 30 ton lead smelting plant for the Rio Grand Dolores mine of Sinaloa, Mexico; a 30-ton copper plant for the Anglo Mexican Co. of Sonora, Mexico; a 30-ton copper plant for the Anglo-Mexican Mining Co. of Sonora, Mexico; a 30-ton copper smelting plant for the Trinidad Co., of Sonora, Mexico; three 30-ton smelting plants for the Sunny Corner Co. of Australia.

This firm are also sending out a large number of Duncan concentrators. Among the mills recently equipped with these machines are the Amador Queen, Amador county; Ulica mill of Calaveras county; Pilgrim mill of Plumas county; Plumas-Eureka mill of Plumas county, as well as various shipments to South America, Central America, Australia, etc.

THE Richmond Consolidated mine, of Eureka, Nev., has paid its first dividend for year, amounting to \$62,500.

Electrical Activity of Ore Bodies.

Carl Barus, of the U. S. Geological Survey, has communicated to the American Institute of Mining Engineers a revision, with changes and additions, of his contribution to the "Geology of the Comstock Lode," G. F. Becker, Geologist in Charge, one of the monographs of the survey. The contribution referred to was on the electrical activity of ore bodies. The experiments were made at the instigation, and under the general direction, of Prof. Becker, who has for some time given detailed attention to the possible electrical activity of ore bodies. The physical work was intrusted to Mr. Barus. Several methods of determining the question had been suggested, but the method adopted considers the ore body as a source of electrical current, and then from a study of the nature and conditions of this flow endeavors to arrive at certain specific effects, referable only to the ore body.

In determining to make the study of local currents a part of the program of the work to be done under his charge, Mr. Becker had selected both the Comstock lode and the Eureka district as available localities in which to test the applicability of an electrical method as an aid to prospecting. The former is a fissure vein, in which the ore, comparatively free from base material, is scattered irregularly through a quartz gangue. At Ruby Hill, Eureka, the ore is principally plumbic carbonate and sulphide, and oxide of iron—the whole containing more or less silver and gold—occurring, moreover, in huge, apparently isolated masses in limestone. In most of the cases, fissures containing vein-matter and connecting the chambers have been traced. The facilities offered for the prosecution of the investigation by the Eureka deposits were, therefore, to all appearances, unusually great. The immense ore bodies in sight were, furthermore, at a mean distance of not more than 400 feet from the surface, and a series of electric surveys could easily be carried out over, through and under them. Finally, it appeared not at all improbable, inasmuch as the ore bodies in places extend to within 100 feet from the surface, and are, in fact, to some extent (on Ruby Hill) above the mean surface of the surrounding country, that local electrical currents might actually be detected on the surface itself. In consideration of this encouraging prospect, due pains were taken to work up all the experimental details with corresponding care.

Above all things, it was necessary to devise some method of obtaining electric contact between the ends of the metallic circuit and the rocks, which would be free from the difficulties met with in the Comstock. Metallic plates, etc., used alone, are objectionable; but it is clear that through the intervention of a suitable liquid, effects of polarization, etc., can be avoided. The following contrivance, based on the well-known excellence of amalgamated zinc in a zinc sulphate solution, for the purpose in question, was finally adopted.

Into a large cork, *a*, 1 to 1½ inches in diameter, Fig. 1, (longitudinal section) is inserted a strip of amalgamated zinc, *z*, about one-half inch broad, to the top of which a gutta-percha covered copper wire, *h*, is soldered. Throughout the greater part of its length, it rests against a stick of wood, *cd*, cylindrical above at *c*, which end is to be thrust through a perforation in the cork *a*, and wedges-shaped below at *d*. At *i* the wire and stick are firmly tied together. A smaller cork *b* secures the lower end of both zinc and stick. The whole is surrounded by a piece of beef-gut (free from salt), tied to the corks *a* and *b*, as shown in the cut.

Into the bag (6 to 10 inches long) thus formed, is poured a solution of zinc sulphate, the under plug being for this purpose removed, and a small funnel inserted. On replacing the plug, the terminal is ready for use. The object of the stick is to obviate accidents due to breakage of the zinc, this material becoming very brittle by amalgamation.

Fig. 2 represents the terminal in place. A suitable hole, 6 to 9 inches deep and 1 to 1½ inches in diameter, is drilled into the rock or vein at an angle of about 30° with the vertical, and filled with a solution of sodic sulphate or water; whereupon the bag is introduced as shown in the figure. The dotted line *m n* indicates the level of the outer liquid, that is, the solution poured into the hole. Solution of sodic sulphate was at first used because it

increases the conductivity, and is not acted upon appreciably by the rock (limestone). It was found, however, that ordinary water which had previously been placed in contact with zinc for some time, so as to precipitate all dissolved matter which might act upon it, was far preferable. When not in use, the bags were preserved in a glass vessel, containing a zinc sulphate solution. During the observa-

used almost exclusively, the whole circuit, nevertheless, being suspended in air from threads, as in the Comstock. In the long circuit on the 600 foot level it was, however, necessary to employ cotton-covered wire for part of the line, the supply of the other being insufficient. This could be done without disadvantage, as follows: A hollow cylinder of gutta-percha, stripped from the end of wire cov-

Fig. 1.—TERMINAL, LONGITUDINAL SECTION.

tions, however, they were transported from place to place in jars containing water. It was desirable during the observation to have the outside of the bag as free from zinc sulphate as possible.

The electromotive force between two similar bags placed in the same external liquid was

Fig. 2.—TERMINAL IN POSITION.

seldom found to be greater than 0.005 volt, usually much less and tolerably constant; whereas the electromotive force of polarization, due to the action of a Daniell under circumstances actually met with in the mine, a number of data being in hand, was in no case as large as

Fig. 3.

0.001 volt, in the experiments cited falling below this limit. Out of curiosity, the bags in a particular instance were filled with water instead of zinc sulphate, when an electromotive force of polarization of 0.020 volt was obtained.

Gutta-percha covered wire No. 19, of excellent quality (Tillotson & Co., New York), was

erred with this substance, was bent in the form of a loop, Fig. 5, and kept heat in this way by a thread passed through its interior and tied. The cotton-covered wire used (*ab* in figure) was passed through this loop, suspended by the other end of the thread.

A case in which gutta-percha covered wire trailed on the ground a distance of about 1000 feet, was made the subject of measurement. The leak was quite perceptible; the insulation offered, however, was about 1,000,000 ohms.

In extending the line from point to point, Reich's plan offers great convenience. For this purpose, the wire is wrapped on a light wooden reel, but in such a way that the inner end also remains accessible. The outer end being in connection with the measuring apparatus, enough wire is uncoiled to reach the desired hole, and a connection (contact-bag) between this and the inner end of the wire is then made. In the damp atmosphere, the reel soon became saturated with moisture, and, in spite of the insulation of the wire, care had to be taken to insulate the reel also.

For the measurement of intensity, Dr. Barus was fortunate in securing a magnificent instrument, made for him after the Wiedemann pattern, by Mr. Wm. Grunow, of New York. This instrument is exceedingly convenient for the purpose, as by an adjustment of the coils, the sensitiveness can be varied over a very wide range. Readings were made with telescope, mirror and scale.

The simple method of consecutive substitution for the measurement of electromotive forces—inasmuch as while there were no reasons for abandoning it there were a great many in its favor—was adopted here, as in the Comstock. The coils of Grunow's galvanometer could easily be so placed as to enable the observer to measure with sufficient accuracy both the lode-current and that due to the latter and the normal electromotive force conjointly, without making any change at the instrument or inserting auxiliary resistances. By means of an inclosed mercury commutator, the current in the galvanometer could be reversed and the deflection thus doubled. All intensities were determined as a mean of five consecutive commutations—not that it was desirable or necessary to increase the accuracy by such a process, but because it appeared essential not to hurry the measurements and to test the constancy of the current as appearing in the five data obtained. Errors from condensation of moisture on the commutator were avoided by excluding the latter entirely from time to time, the measurements being made by simply connecting the wires with clamp-screws. Space forbids our going into detail of results, the object here being to describe the apparatus employed for obtaining the observations.

A Boiler Explosion at Lake Merced.

A disastrous boiler explosion occurred last week at the Lake Merced pumping works of the Spring Valley Water Works, killing two men and wounding others. The explosion set fire to the ruins, which were burned, despite the heavy rains. Pieces of the boilers were found 1500 feet away from the building. There were two engines in the house capable of throwing 10,000,000 gallons of water daily to an elevation of 305 feet. They were completely destroyed. The works supplied what is known as the middle district of the city, lying west of Valencia street, and including a strip of four blocks running parallel with Market street, extending westward from Montgomery. Superintendent Lawrence, of the water works, estimates the damage at \$55,000. The engineer of the works, who was temporarily out of the building, and was unhurt, says, concerning the accident: "I cannot account for the explosion in any way, and have no theory about it. It was the two twin boilers nearest the engine that burst. They were cleaned on Tuesday and filled with water. We found the manhole leaking when we started up steam to-day, about two o'clock. The stream was shut off, the manhole taken out, and a new gasket put in. Then she was fired up again, and had run only an hour when the explosion took place." Wm. Johnson, the assistant engineer, who was in charge at the time of this explosion, and was slightly injured, says: "I was in charge of the engine-room at the time of the blowing-up. Mr. Williams had come to the house for a few moments. There was from 85 to 90 pounds of steam in four of the boilers, and but an instant before the crash I saw that there was only 54 pounds in the two first boilers. We were just getting up steam in them, and could not make the connection with the other boilers until we got them up to 85 pounds. Everything was running smoothly at the time of the explosion, and I am positive that there was only 54 pounds pressure in those two first boilers."

Since this accident, a meeting of the Pacific Coast Stationary Engineers has been held and the following resolutions adopted:

WHEREAS, immediately after the explosion at the tripe factory at South San Francisco, a committee of the Board of Supervisors, consisting of Farwell, Abbott and Kunkler, after carefully investigating the cause of said explosion, did present to the Board of Supervisors a report over their signatures, stating a large number of engines and boilers in this city and county were in charge of incompetent and untrustworthy persons and recommending the appointment of an inspector of boilers to examine and license engineers; whereas, the disaster at Lake Merced furnishes additional evidence, if any were needed, of the necessity for a State or municipal inspector of all steam boilers.

Resolved, That the Executive Committee of this association wait on Mr. Abbott and the members of the Board of Supervisors, individually and collectively, and once more urge them to adopt the plan presented by this association, or some other plan that will provide for some intelligent supervision of all steam boilers.

The engineers have circulated a petition asking the Supervisors to pass an ordinance to point a boiler inspector and license engineers, and they further ask all other organizations which may have a fellow feeling in the matter to aid in making it an issue in the coming municipal election.

A Coroner's jury has decided that an unaccountable accident caused the death of John Ryan and Peter Duffy, who were killed by the explosion. The owners and builders of the works were freed from blame by the jury.

At Aspen, Colorado, where there is a large smelting company, they have been taxed on the full value of ore on hand at the time of making the early assessments, amounting to \$10,000. A case on attachment is now before Judge Goddard. The smelting company desires to build an addition to the works, but will not, owing to the tax. If the tax is collected the smelter declares it will move to some other county. At a meeting of the citizens held Wednesday night, to discuss the matter, an unanimous vote that the tax be abolished, was passed.

The last steamer for China took from this port \$388,920 in silver bars, \$232,624 in Mexican dollars, \$9788 in gold coin, and \$750 in gold dust; a total of \$632,084.

The Standard Cons. mine, Bodie, employs 55 men, at a daily expense of \$225.

PRACTICAL HYDRAULICS.

NUMBER II. COPYRIGHTED.

PRINCIPLES OF HYDRAULICS.

Written for MINING AND SCIENTIFIC PRESS by P. M. RANDALL.]

Ex. 54.—A rectangular orifice being 9 inches high and 1 foot wide in the end of a conduit, as A G F E, Fig. 16, 1 foot high, 1.25 feet wide, and 3 feet long, under a head of 3.5 feet on center, of water nominally still in tank, B A D C, what is the coefficient of discharge?

By Table 7, the coefficient of discharge due to the velocity of the water in the tank is $c_v=.609$, and given head of water nominally still is $c=.609$.

Area of orifice, $.95 \times 1 = .95$.

Area of cross-section of conduit, $1.25 \times 1 = 1.25$.

Ratio of transverse sections $n = \frac{1.25}{.95} = 1.325$.

By Table 11, the value corresponding to $n=1.325$, the ratio of transverse sections, is $\frac{c_n-c}{c} = .0208$; whence

$$c_n = 1.208c.$$

Substituting in last equation the value of $c=.609$. $c_n = 1.208 \times .609 = .736$.—Ans.

Ex. 55.—An orifice 2 feet square in the end of a conduit, A G F E, Fig. 16, 2.5 feet square, 6 feet long, under a head of 5 feet on center of water nominally still in tank, B A D C, what is the discharge in cubic feet per second?

Cal. 1st.—By Table 7, the coefficient of perfect contraction applicable to an orifice 1 foot wide, 2 feet high, under a head of five feet of water nominally still, is $c=.612$.

By Rules 28 and 29,

Part suppressed (both ends) $2 + 2 = 4$ feet.

Entire perimeter (tabulated orifice) $1 + 1 + 4 = 6$ feet.

Ratio of entire perimeter to part suppressed $= \frac{6}{4} = 1.5$, 1.43 times this ratio; $0.143 \times 1.5 = .0953$.

Sum of 1 and this product $= 1.0953$.

This sum, multiplied by tabulated coefficient, $1.0953 \times .612 = .670$.

0.143 times the product of the coefficient of perfect contraction, and the ratio of the entire perimeter of the orifice 1 foot wide to the part suppressed, divided by the breadth of the given orifice, $0.143 \times .612 \times \frac{4}{2} = .029$.

Coefficient due given orifice (2 feet square) under head of still water:

$$c_b = .670 - .029 = .641.$$

Area of given orifice, $2 \times 2 = 4$ square feet.

Area of cross-section of conduit, $2.5 \times 2.5 = 6.25$ square feet.

Ratio of transverse sections, $n = \frac{6.25}{4} = 1.5625$.

By Table 11, the value corresponding to $n=1.5625$, the ratio of transverse sections is $\frac{c_n-c}{c} = .241$.

By interpolation between values corresponding to $n=.60$, and $n=.65$, there results approximately:

$$\frac{c_n-c}{c} = .234; \text{ whence,}$$

$$c_n = 1.234c.$$

Substituting the value of $c_b=.641$, as before found, in the last equation, and there results:

$$c_n = 1.234 \times .641 = .791.$$

By Table 6, square root of head $5 \sqrt{5} = 2.236$.

By Rule 27, $Q = .791 \times 8.025 \times 4 \times 2.236 = 56.78$ cubic feet.—Ans.

Cal. 2d.—By Table 7, the discharge found for an orifice 1 foot wide, 2 feet high, under a head of 5 feet, is 21.98 cubic feet per second.

If it be assumed, that for practical purposes, the discharge through the given orifice 2 feet square, in example 55, will be proportionate to the tabulated discharge, there will result:

$$Q = 21.98 \times 2 = 43.96 \text{ cubic feet per second.}$$

By comparison, it is seen the result by Cal. 1 is nearly 30 per cent greater than that obtained by Cal. 2d.

This discrepancy seems to illustrate the necessity of careful investigation in essaying the determination of problems of practical hydraulics, however tedious the process may be.

COEFFICIENT OF THE FLOW OF WATER THROUGH A VERTICAL RECTANGULAR ORIFICE, UNDER A HEAD IN MOTION.

FIG. 17.

The case in which the head of water is in motion, occurs for the most part in open channels. In Fig.

17, A B C D represents a vertical section lengthwise of a stream of water in an open channel. B C a dam across the stream, in which is an orifice, E F in height. The dam is assumed to act as a restraint, but not sufficient to sensibly affect the mean velocity of the stream of water above it.

Let c =coefficient of discharge under a head of water, nominally still.

c_n =coefficient of discharge under a head of water in motion, and dependent for its value on the ratio n .

A=area of orifice.

A_c =area of cross section of canal on channel.

$$n = \frac{A_c}{A} \text{ ratio of these areas, not exceeding } \frac{1}{2}.$$

Weisbach gives as the result of his experiments, the head being measured 1 metre=3.28 feet above the dam.

$$\frac{c_n-c}{c} = 0.641 \left(\frac{A}{A_c} \right)^2 = 0.641 n^2, \quad (104)$$

whence,

$$c = (1 + .641 n^2) c. \quad (105)$$

TO FIND THE COEFFICIENT OF DISCHARGE UNDER A HEAD OF WATER IN MOTION.

Rule 30.—Add 1 to .641 times the square of the ratio, of transverse sections—that of the canal to that of the orifice—and multiply this sum by the coefficient of discharge due the given orifice and given head as though it was in still water.

Rule derived from formula. (105)

TABLE 12.

Corrections of the Coefficients of Flow Through Rectangular Orifices Under a Head of Water in Motion. Weisbach.

$n \dots$	0.05	0.10	0.15	0.20	0.25	0.30	0.35	0.40	0.45	0.50
$\frac{c_n-c}{c}$	0.002	0.006	0.014	0.026	0.040	0.058	0.079	0.103	0.130	0.160

Ex. 56. A dam containing a rectangular orifice 5 feet wide, 1 foot high, put across a flume 6 feet wide, raises the water 5 feet in height above the bottom of the flume, and 3.5 feet above the lower edge of the orifice. What is the discharge in cubic feet per second?

Cal. 1st.—Half height of orifice=.5 feet.

Head on center $3.5 - .5 = 3$ feet.

Area of orifice $5 \times 1 = 5$ square feet.

Cross section of flume, $6 \times 5 = 30$ square feet.

Ratio of transverse sections $\frac{30}{5} = 6$.

Square of ratio $(6)^2 = 0.278$.

By Table 7. Coefficient of perfect contraction for an orifice 1 foot wide, 1 foot high, under a head of 3 feet is=.605.

By Rule 28.—Part (both ends) suppressed $1 + 1 = 2$ feet. Entire perimeter (tabulated)=4 feet. Ratio of entire perimeter to part suppressed, $\frac{4}{2} = 2$, 1.43 times this ratio; $1.43 \times 2 = .0715$. This sum multiplied by .605 the coefficient of perfect contraction, gives the value of the coefficient of partial contraction when the contraction of both ends is suppressed.

$$c_n = 1.0715 \times .605 = .648$$

By Rule 29.—0.143 times the product of the coefficient of perfect contraction and the ratio of the entire perimeter of the orifice 1 foot wide, to the part suppressed, divided by the breadth of the given.

$$0.143 \times 5 \times .605 \div 5 = .009,$$

whence:

$$c_b = .648 - .009 = .639.$$

Substitute the value of $c_b=.639$ for c , and the value of the square of the ratio; $(\frac{1}{6})^2 = .0278$ in formula (105) or employ Rule 30.

$$c_n = (1 + .641 \times .0278) \times .639 = .650$$

By Table 6:

Square root of given head of 3 feet=1.732.

By Rule 27:

$$Q = .650 \times 8.025 \times 5 \times 1.732 = 45.17 \text{ cubic feet per second.} \text{—Ans.}$$

Cal. 2d. By Table 7. The discharge found for an orifice 1 foot wide, 1 foot high, under a head of 3 feet is 8.41 cubic feet per second. If it be assumed that for practical purposes the discharge through the given orifice, 5 feet wide, 1 foot high, in example 56, will be proportionate to the tabulated discharge, then will result

$$2 = 8.41 \times 5 = 42.05. \text{—Ans.}$$

Discrepancy of 3.12 cubic feet, or $7 \frac{1}{10}$ per cent.

FLOW OF WATER THROUGH SHORT TUBES.

Short tubes or adjutages are cylindrical, conical or compound in form.

Cylindrical Tubes.—The length of a cylindrical tube being from 2.5 to 3 times its diameter, the mean coefficient of flow through it as determined by the experiments of Bidone, Eytelwine, D. Aubuisson and Weisbach, is .815, while under otherwise similar circumstances, the mean coefficient of discharge through

an orifice in a thin plate is .615. The ratio of .815 to .615 is 1.325; that is, the discharge through a short tube of the given proportions (2.6 to 1), is 1.325 times as much as the discharge through an orifice of equal diameter in a thin plate. For practical purposes this ratio may be assumed general in its application without material error; hence,

To find the coefficient for a short tube, having given the coefficient of an orifice in a thin plate, of equal diameter, and under an equal head.

Rule 31.—Multiply the given coefficient of the orifice by 1.325.

Ex. 57.—The diameter of a short tube—length to diameter as 2.6 to 1—being 6 inches, and the head 9.06 feet, what is the coefficient of discharge?

Cal.—Given diameter $6'' = .5$ feet.

By Table 9, coefficient due orifice, .5 feet diameter, under 9.06 feet head=.602.

By Rule 31, $.602 \times 1.325 = .798$.—Ans.

In case there are no experiments on which to rely, the mean coefficient .815 is to be employed.

Let d =diameter in feet of a cylindrical tube whose length is from 2.5 to 3 times the diameter.

h =head of water on center.

$c=.815$, coefficient of discharge.

$a=.7854d^2$, area of cross section of tube.

Q =discharge in cubic feet per second.

Substituting the values of a , c and $h=h$, in equation (92).

$$Q = .815 \times 8.025 \times .7854 d^2 \sqrt{h}. \quad (106)$$

Whence,

$$Q = 5.137 d^2 \sqrt{h}. \quad (107)$$

To find the flow of water through a cylindrical tube whose length is from 2.5 to 3 times the diameter.

Rule 32.—Multiply the square root of the head of water on center by 5.137 times the square of the diameter of the tube.

Rule 32 derived from equation (107).

Ex. 58.—A tube being 3 inches in diameter and 8 inches long, and the head of water in the center being 5 feet, what is the discharge in cubic feet per second?

Cal.—Diameter $3'' = .25$ feet.

Square of diameter $.25 \times .25 = .0625$ square feet.

By Table 6. Square root of head; $\sqrt{5} = 2.236$.

$Q = 5.137 \times .0625 \times 2.236 = .718$ cubic feet.—Ans.

In case the proportion of length to diameter is much changed, as 1 to 1, the coefficient of flow is nearly the same as that for a thin plate, or if the length be much increased over three times the diameter, the coefficient .815 becomes diminished according to the occurrence of friction of the sides of the lengthened tube, which is termed a pipe.

Conical Tubes.—Conical tubes are convergent or divergent. The outer orifice being smaller than the inner, the tube is convergent; but if larger, the tube is divergent.

Convergent Tubes.—Extensive experiments have been made by D. Aubuisson and Castel on the flow of water through convergent tubes. These were made with tubes of various sizes and proportions; but mostly with those .61 inches diameter at the discharging end, 1.59 inches at the inlet end, and under a head of water 9.84 feet. The results of their experiments, as stated by Weisbach, are given in the following table:

TABLE 13.

Coefficients of discharge and velocity for flow through conically convergent tubes. Smaller diameter=.61 inches.

Angle of Convergence	Coefficient of Flow.	Coefficient of Velocity.	Angle of Convergence	Coefficient of Flow.	Coefficient of Velocity.
0° 0'	0.829	0.829	13° 24'	0.946	0.963
1° 36'	0.866	0.867	14° 28'	0.941	0.966
3° 10'	0.895	0.894	16° 36'	0.938	0.971
4° 10'	0.912	0.910	19° 23'	0.924	0.970
5° 26'	0.924	0.919	21° 0'	0.919	0.972
7° 52'	0.930	0.932	23° 0'	0.914	0.974
8° 58'	0.934	0.942	29° 58'	0.895	0.975
10° 20'	0.938	0.951	40° 20'	0.870	0.980
12° 4'	0.942	0.955	48° 0'	0.847	0.984

Ex. 59. The smaller diameter of a conically convergent tube being 6 inches, the angle of convergence $5^\circ 26'$ and the head of water on center 9.06 feet, what is the flow of water in cubic feet per second?

Cal.—Diameter 6 inches=.5 feet.

By Table 9 the coefficient corresponding to the given diameter and head=.602, and coefficient corresponding to .61 inches on which Table 13 is based=.618.

By Table 13 the coefficient corresponding to the given angle of convergence $5^\circ 26'$ is=.924.

Ratio of coefficients $.602 \div .618 = .974$.

Then coefficient of flow due the given diameter $.924 \times .974 = .900$.

And cross section of tube $.5 \times .5 \times .7854 = .1963$ square feet.

Lead Smelting—No. 4.

Ore Buying.

Ore is purchased either directly from the mines themselves for cash or from sampling works, which either buy from the mines or act as their agents. Various considerations affect the price paid. From the assay value of the ore in silver a certain percentage is deducted for loss in smelting, which varies according to the nature of the ore, whether siliceous, ferruginous, or sulphureted, or according to a special arrangement made between the mine owners and the smelter owners. A further variable change is made for cost of treatment, which is dependent on the nature of the ore and its tenor in lead. As a general rule in regard to oxidized ores, the charge for treatment is lower the larger the percentage of lead they contain. When this tenor is between 5 and 30 per cent, the lead is paid for at from 15 to 45 cents a unit of 20 pounds; the higher the percentage of lead the higher the price paid per unit. When the ore contains less than a certain percentage of lead, which varies with the quality of the ore, the mine owner receives no remuneration for the lead contained in his ore, however rich it may be in silver. The following table gives a specimen of the rates charged for treatment of the ores of some of the best-known mines, the deduction made for the loss of silver, and the price paid for each unit of lead above the certain percentage:

NAME OF MINE.	Deduction for loss of silver, smelting.	Cost of treatment per unit of 20 lbs.	Price of lead per unit of 20 lbs.
Amble.....	10 per cent	\$25 00	\$9 25
Chrysolite.....	5 "	20 00	25
Dunkin.....	5 "	22 00	25
Carbonate.....	7 1/2 "	20 00	25
Evening Star.....	7 1/2 "	28 00	25
Morning Star.....	5 "	15 00	30
Iron.....	5 "	18 00	30
Tucson.....	5 "	21 00	25

These figures vary from month to month unless a time contract has been entered into, and are governed by the market quotations of silver and lead at New York and the prices of coal, charcoal, and fluxes of Leadville. Gold, when present in excess of one-tenth of an ounce to the ton, is paid for at the rate of \$18 per ounce. The transportation of ore from the mines to the sampling or smelting works is paid for by the smelters at the rate of \$1 to \$1.85 per ton.

Sampling.

When the ore arrives at the sampling works, it is weighed in the wagon on scales generally occupying a detached building. It is then thrown into bins or piles in the open yard, every tenth shovelful as a rule being put into a wheelbarrow. The sample thus obtained is spread out on the sampling floor and in the case of a sand ore is worked up directly to obtain a thorough mixture. Hard ores are first passed through Cornish rolls. When the ore is thoroughly mixed, it is repeatedly quartered till a sample convenient for drying has been obtained. After drying it is further crushed, mixed, and quartered, and a portion is then ground on the hucking plate by the bucker (a) until it passes through a sieve of 70 to 80 meshes to the linear inch. The sample is then divided into three portions, one of which is assayed at the smelter, and the second at the mine or by a public assayer who may be employed by the mine. If the results of the two assays agree closely, a mean is generally taken as the true value of the lead; otherwise the third portion is sent for control to a third independent assayer. Sand ores require no crushing before charging into the furnace. For hard ores, slags, fluxes, etc., Blake, and occasionally Alden crushers, driven by steam-power, are employed.

FRANCE AND GERMANY.—Unfavorable comments are often made in regard to the industrial progress of these two countries—Germany being usually placed far in the lead of France. Instance the following:

France is not prosperous. Allowing for the million and a half taken away by Germany, the population has made no progress at all since 1860. Its numbers are smaller now than they were fifteen years ago, while the load of taxation has almost doubled—in mere charges it has much more than doubled. Equally stationary has been the export trade. The average of recent years has indeed been lower than for the years immediately succeeding the war. Imports have, on the other hand, augmented much, but not because the country has been internally prosperous. The increase is the consequence of bad harvests, and indicates a further denudation of the wealth of the people.

Notwithstanding the above and many similar comments of the press, Mulhall in his statistics—than whom there is no better authority—says that the annual accumulation of wealth in France is \$335,000,000, while that of Germany is but \$200,000,000. This is all the more striking when it is observed that the population of Germany is 45,000,000 against 37,000,000 for France.

OKLAHOMA.—Senator Van Wyck has introduced a bill to provide for the organization of that part of the territory of the United States now known as Indian Territory, and the public land strip into a Territory, to be known as the Territory of Oklahoma; to provide a temporary government for the same; for the allotment of homesteads to Indians in severalty, and to open the unoccupied lands to settlers.

USEFUL INFORMATION.

Metallic Carriage Wheels.

A great many people, no doubt, have wondered, says the *Age of Steel*, why the ordinary bicycle wheel, with slight modifications, could not be used to advantage on buggies and carriages—why, with some strengthening of the spokes and the substitution of the metal for the rubber tire it could not be made to do service in the latter capacity quite as acceptably as in that to which arbitrary custom has confined it. For apart from there being no obvious and insurmountable objections to such enlargement of its uses, good reasons can be brought forward to favor the change. These latter need not be touched upon now; they will occur to most anyone upon a little reflection.

The journal above quoted says that a company has already been formed, which is now at work turning out 100 sets of carriage wheels with steel spokes resembling in general construction the ordinary bicycle wheel. These wheels will be used on the streets, and will afford the first opportunity of judging of the merits of metallic wheels on carriages. Some of the wheels have already been made, and are said to appear remarkably strong, much more elastic, and ten per cent lighter than the ordinary wooden carriage wheel.

The wheel is described as follows: The hub is composed of three pieces, and is held together by the axle box, terminated at one end by a nut. The two rows of spokes are held in place between the central piece of the spoke and the two outer pieces of the same, the inserted ends being headed. The outer ends of the spokes are passed through the felloe and adjusted to the tire by a screw thread, by which contrivance equal tension is secured on all the spokes. The distance apart of the two rows of spokes at the hub is 2 1/2 inches, securing what is called a regular "truss." The spokes in the 44-inch front wheel are 16 in number, and in the 48-inch hind wheel 18. They are each 1/4-inch in diameter, and of a quality of steel possessing a tensile strength of over 2000 pounds. The hubs of the wheels are of the best quality of malleable iron.

The advantages claimed for this wheel are greater durability, lightness of weight, and greater cheapness in the making of repairs. Another feature wherein this wheel differs from the wooden is that the load is always suspended upon it, as in the case of a bicycle, instead of resting only on that part of the wheel directly underneath. Practically the upper part of the wheel, with the aid of the tire and the felloe, carries all the load, which is exactly the reverse of what happens in the case of the wooden wheel. This distribution of weight over the whole wheel checks necessarily the tendency to elongate over the surface of the lower half.

Paper-Hangings and Curtains from Leather.

Many persons have doubtless noticed articles going the round to the effect that paper-hangings for reception rooms, libraries, and even for palace-car curtains, are now being made entirely from leather scraps, or at least covered or embossed with leather. It is true that waste leather is used for the purpose, but only to a limited extent, the cost and difficulty of manufacture having thus far prevented capitalists from putting up much money on it. In order to give permanency to the process, consideration must be had for the inequalities of each and both substances, for it must be remembered that the difference in expansion, contraction, susceptibility to the alternate influences of heat and cold, dryness and moisture, to which this "new candidate" will ever be subjected, will remain as apparent when brought together by any mechanical means as when separate. It follows, then, that varieties of each substance, out of which it is desired to make these novel goods, must be selected possessing the greatest number of characteristics, both physical and others, in common, and then, if some principle of chemistry can be brought to bear by which certain affinities may be brought in combination, permanent success is only a question of time, and, when once it has been attained, cost will soon be reduced to the minimum. Experiments are now being made with chemical fiber and pulp from scrap leather, the results of which, whether successful or not, will appear at another time. It is understood that the new material departs in several important particulars from the character of leather board with which paper-makers are familiar.

AN OCEAN STEAMER'S PROVISIONS.—An ocean passenger steamer is provisioned as follows, for the passengers and crew: Three thousand five hundred pounds of butter, 3000 hams, 1600 pounds of hicknuts, exclusive of those supplied for the crew, 8000 pounds of grapes, almonds, figs and other desert fruits; 1500 pounds of jams and jellies; tinned meats, 6000 pounds; dried beans, 3000 pounds; rice, 3000 pounds; onions, 5000 pounds; potatoes, 40 tons; flour, 300 barrels; and eggs, 1200 dozen. Fresh vegetables, dead meat and live bullocks, sheep, pigs, geese, turkeys, ducks, fowls, fish and casual game are generally supplied at each port, so that it is difficult to estimate them. Probably two dozen bullocks and sixty sheep would be a fair average for the whole voyage, and the rest may be

inferred in proportion. During the summer months, when traveling is heavy, twenty-five fowls are often used in soup for a single dinner.

HOW TREES DIE.—A contemporary remarks: When Dean Swift facetiously predicted that he would die like a tree, by "going off at the top," anticipating the failure of his mental powers, he correctly described the beginning of natural decay in trees. There are exceptions, but as a rule the visible signs of decay begin at the top. The cause of decay may lie elsewhere, but the top limbs are the first parts that become paralyzed. The enfeebled vitality is unable to drive the sap to the extremities, the pores being choked up, and the limbs die. This is apparent in mostly all plants and trees that die what may be called a natural death. At all times the circulation and the vitality is weakest at the extremities, just as in animals, and it may almost always be noticed that most injury from cold is done, not always to the most exposed parts, but to the extremities of the shoots. It is this vigor, the nearer we get to the root, which has no doubt led cultivators to suppose that cutting a limb back puts strength into a plant, but the idea is quite erroneous. Undoubtedly the further we cut back at the right season the stronger does the shoot grow for a certain distance, but no additional strength is added. What was wanting before cannot be put there again by the removal of any portion of what is left.

TO DETECT FIRE DAMP.—All kinds of ingenious contrivances have been brought forward at different times for the detection of fire-damp in mines, but most of them have been of a very complicated nature. The last of the series, however, is so simple, that it seems astonishing that no one thought of it before. A child's india-rubber ball with a hole in it, is squeezed flat in the hand and held in the place suspected of fire-damp while released, and allowed to suck in the sample of the air. The ball is now directed toward a safety lamp, and again squeezed, when the tell-tale blue flame will show if it contains any inflammable vapor.

POWER FROM SHAFTING.—A firm which makes a specialty of the erection of shafting, states that its experience teaches that the loss of power due to improper conditions in the line shafting amounts to fifty per cent of the engine power employed, and that the defects most commonly found, are as follows: Shafting too light for the duty, crooked shafting, hangers too far apart, hanger bearings too short, pulleys too heavy and not properly balanced, hangers which are not adjustable and not self-adjusting, and sometimes filled with spurious Babbitt metal, and improper proportion between two pulleys connected by the same belt.

LEADING OCCUPATIONS.—In 1860 the wood industries employed 130,000 persons; to-day they employ 340,000 while the value of their annual product has trebled. The woolen industry employed 60,000 persons then, and now employs 160,000, while our home mills, which produced goods of the value of \$80,000,000 in 1860, now turn out an annual product worth \$270,000,000. The iron product amounted to 900,000 tons of ore; to-day it foots up over 8,000,000 tons a year, almost a ninefold increase. The silk industry employed 5000 persons; now it employs about 35,000, seven times as many.

SOLID BODIES shine in the dark, or become luminous, when heated from 600 degrees to 700 degrees F., and in daylight only when they reach a temperature of 1000 degrees.

GOOD HEALTH.

Overcoat "Colds."

This is the season most appropriate for a little serious reflection on the subject of overcoats. Nothing seems more simple than to adapt clothing to the weather by the addition of an overcoat, light or heavy, as the occasion requires. It must not, however, be forgotten that just in proportion as the garment superimposed upon the ordinary clothes is effective in producing a sense of warmth, it acts by arresting the evaporation of warm vapor from the body. This warm vapor continues to rise through the ordinary clothing, but it is prevented from escaping, and the clothes are saturated with it. The general effect is well enough while the overcoat is kept on, but the moment it is removed evaporation recommences, and the body is placed in a "cooler" constructed on the principle adopted when a damp cloth is wrapped around a butter dish, the vapor passing off, abstracting the heat, and leaving the contents of the cooler refrigerated.

The point to make clear is that the overcoat, let it be fashioned and ventilated as it may, does not prevent the underclothing from being saturated with moisture, but actually tends to make the moisture accumulate therein. This is proved by the sense of genial warmth felt while the overcoat is worn, and the evidences of perspiration, easily perceived under the arms and at the sides of the chest particularly, immediately after the overcoat has been removed. Moreover, we take off the coat when we enter a warm house, and precisely at the moment when muscular activity is suspended. A very little consideration will suffice to convince the common sense thinker that nothing can well be

worse managed than this process, both as regards its nature and the time and conditions of its operation. It is opposed to all the canons of health to allow the clothing to become saturated with perspiration, and then to take off the external covering and suffer rapid cooling by evaporation; while, if it were designed to do this at the worst possible time, probably none worse could be found than when muscular exercise has been discontinued.

The suggestion we have to offer is, that it would be far better policy to wear only one coat at a time, and to make whatever change may be necessary by removing a thin coat and replacing it by a thicker one, when going out of doors, and the reverse when coming in. If, instead of wearing overcoats, people would wear coats of different thicknesses, according to the conditions generally, they would avoid the danger of cooling by evaporation; the garments saturated with moisture would be removed, and dry off the body instead of on it. We believe no inconsiderable proportion of the "colds," attacks of lumbago, and even more formidable results of what are popularly called "chills," may be traced to the practice of wearing overcoats which arrest the ordinary process of evaporation, cause the clothing within to be saturated with accumulated perspiration, and are then removed, when rapid cooling takes place. The avoidance of this peril is to be attained by such change of coats as the conditions require.—*Lancet*.

DEATH FROM CARELESSNESS.—Two instances within one week have been reported of men being killed while walking on railroad ties in the East. One of the victims was so deaf that he could not hear the approaching train. The other was reckless enough to take the chances of being run over. Both suffered death for their temerity. Some people will never gain wisdom nor profit by the experience of the past. So it is with those who snap guns and pistols at others, in the belief that the weapons are not loaded, and discover how fatal has been their error when they see that the person aimed at has been killed. And so, also, with those who pull loaded guns from wagons, with the muzzles toward them, and receive the contents of a discharge in their bodies. These fatal accidents are recorded by the press as items of current news, but not with the expectation of always preventing them. This same sort of incaution has been the subject of notice time out of mind, and will probably continue through generations to come.

ALCOHOL AND ITS USES.—Recent investigations show that alcohol is oxidized in the system, and is converted into carbon dioxide and water, while but little is eliminated as alcohol from the system. In moderate doses it has no influence on the body heat, but in somewhat larger doses it reduces body-temperature by absorbing the oxygen and preventing it from oxidizing the tissues. It is, therefore, of use in febrile diseases in doses of 1/2 to 1 fluid ounce several times daily, until a total of 5 to 8 ounces per day has been given. The prescribing of alcohol by physicians seems to be decreasing, and the tendency also seems to be setting in favor of prescribing pure alcohol suitably diluted, rather than any of the liquors in which there are various volatile ethers, derivative mainly of fused oil, the action of which is but illy understood, but many of which probably act injuriously.

CAUSES OF DISEASE.—The chief causes of disease are sudden colds, errors in diet, errors in dress, or intemperance, drinking impure water, eating unwholesome food, defective teeth, blood poisoning from impure air, noxious gases or suppurating wounds. Disease induced from any one of these causes almost invariably manifests itself by disorder in the functions of the liver; the alarm is generally sounded there first, and if not promptly attended to the trouble is liable to extend to other vital organs. Dyspepsia, constipation, chronic diarrhoea, disease of the kidneys, dropsy, catarrh, rheumatism, consumption and various forms of skin diseases, often proceed directly from derangement of the liver.

Symptoms.—When you feel restless, melancholy and uncomfortably, with, perhaps, a dull headache, it probably proceeds from a torpid liver. When you have a sudden attack of rheumatism, it is generally due to a cold which has been brought about by an unhealthy condition of the secretions. While, as a general thing, a physician should be sent for on the first serious symptoms of sickness, Dr. Hall, in his *Journal of Health*, recommends as a prompt and a safe remedy for a cold or incipient liver derangement, "Hall's 'old time' liver pills." This, however, is not intended as a puff for those or any other pills.

DANGER FROM HYDROGEN IN ZINC DUST.—It has long been known that shippers are unwilling to carry large quantities of zinc dust in their vessels, owing to the danger of its getting moist, and becoming heated to a dangerous extent. Mr. Greville Williams, F. R. S., has recently made some researches which throw light on this matter. He finds that wetted zinc dust, after drying, gives off nearly double the hydrogen that unwetted dust gives. Hydrogen is absorbed from a moist atmosphere at moderate temperature by zinc dust. It has, in fact, the power of occluding hydrogen after the manner of spongy platinum.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

VOLCANO TUNNEL.—Amador Ledger, Dec. 26: C. S. Hohmann and C. Hoffmann report that prospects never looked better. Although much rain had fallen there the rivers had gone down with surprising rapidity. It is the intention of the managers of the mine to build a bulkhead and change the channel of the creek, so that in case of freshets water which now goes to waste could be saved. A tract, 600 feet in length, is to be built for the purpose of hauling rock for the bulkhead.

WATER WHEEL EXPERIMENTS.—The water wheel experiments which are about to be made at the Zeile mill are in the interest of the Zeile Mining Company, for the purpose of ascertaining beyond dispute which wheel is able to run the machinery with the least amount of water. A Pelton wheel has been purchased, and will be pitted against the three modifications of the Knight wheel, and whichever proves most satisfactory will be adopted at the Zeile hereafter. Over 300 inches of water is now required to run the machinery; the water bill alone costs over \$1000 per month, so that a saving of 5 or 10 per cent in water would be quite an item in the course of a year. The experiments will probably be made next week.

Butte.

MAGALIA.—Oroville Register, Dec. 23: Miners on the Magalia ridge look for a good year during 1886, and are busy preparing for it now. The Wiley Bros. and Collins are running a tunnel and otherwise prospecting their claim. At the Dyer and Babcock mine new machinery has lately been put in for the purpose of draining the mine, and work will now be vigorously pushed from this time forward. The owners have lately put up new buildings over their hoisting works, and the gravel that they have found looks well, so are long we may expect to hear of the channel being struck. Mr. Wm. Brown is opening a new claim just below Magalia. The old Willard mine will be started up in about three weeks and then work will be vigorously prosecuted on the same. At the Red Hill nothing at present is being done. The Black Channel Mining Company are pushing work, and before many months it is thought there will be some big developments. Williams & Co., near the Mineral Slide, are driving ahead, and hope to strike pay in a short time. The Mineral Slide mine has always been worked to disadvantage on account of the water in the tunnel, and now the owners are running a drain tunnel to draw off the water, so that the mine can be worked to greater advantage and at less expense than formerly.

Fresno.

AT WORK.—Fresno Republican, Dec. 29: On a trip through the mining region on the north side of the San Joaquin river, in Potter Ridge and Fine Gold mining gold districts, the writer was surprised at the extent of development made and the number of men engaged in both placer and quartz mining all through that section. A great many men are engaged in overhauling the old places, which has been made possible by the abundant supply of water. Some are making good wages, while we found many who claimed to be barely making "grub." At the old Abby mine on Lower Fine Gold great activity prevails. A substantial plant of new hoisting machinery is in operation. Preparation is being made to erect a ten-stamp mill at once, the machinery being now in course of transportation from the railroad to the mine. A quarter of a mile west from the Abby mine is situated the famous Hildreth mine. The vein, although not very large, shows a high grade of ore in all the stopes and drifts. A large steam boiler supplies steam for pumping, hoisting and running the mill. The equipment of the mine is complete. We visited the Last Chance mine of McKenzies & Rule on the north fork of Fine Gold. This mine is splendidly situated for convenience in working, and what is more attractive is the fact demonstrated by the large stores of rich ore in sight ready to be stooped out. The owners are practical miners and have stuck to this property for ten years, and by hard work and careful management have got their mine opened up quite extensively, with large reserves of ore, and have made it more than pay for development as they went along. At Quartz Mountain everything is very quiet. Contracts have been let for sinking a main working shaft to a depth of 250 feet; also about 2½ miles of iron piping has been ordered for taking water from their ditch to the quartz mill for power. At the Fresno Enterprise mine the working force, consisting exclusively of Chinamen, except a white foreman, has been principally doing exploration work for the past year, no ore of consequence having been mined. There is more activity and better returns for the work being done in Fresno mines than ever before in the history of the county.

Inyo Co.

DEFIANCE.—Independent, Dec. 26: Twenty-five tons of ore from the Defiance mine were delivered at Keeler at the beginning of the week. Mr. Reddy intends to ship about ninety tons a month. The ore goes from 85 ounces to 300 ounces silver per ton, and from 77 to 80 per cent lead. The ore body in the mine is now opened 100 feet in length, and 100 feet in depth, and of this a seam of at least two feet wide is solid galena ore, of the value given above. Outside of this seam is a very large ledge of carbonate and oxide ores, that assay from 40 ounces to 200 ounces silver per ton. All of these ores continue of the dimensions and values given as far as the openings in the mine yet extend. Work is still pushed ahead, and how much farther the ore body extends is only a matter of conjecture. Certainly there is ore enough now in sight to amply compensate Mr. Reddy for all his patience, toil and expense.

Nevada.

TO RESUME.—Foothill Tidings, Dec. 26: We are informed that there is a probability of the Massachusetts Hill mines resuming work. The numerous owners of the properties on that famous hill are talking of consolidating their interests, and if this is done a well-known mining man, formerly a resident here, will assume the management of the property. We trust that this arrangement will be carried out, as it seems that nothing but success could be the

result. There have been many thousands of dollars taken from Massachusetts Hill, and that in the early days when milling was not near as perfect as it is now, and no doubt there are fortunes in that hill yet.

GOOQ QUARTZ.—Herald, Dec. 26: A fine grade of quartz rock has been opened up at the Nevada county mine. Superintendent Fleming showed the writer a piece of quartz to-day that he had just taken from the south drift, that rivals anything of the kind we have seen for some time. The piece was about eight inches by four in size and was very heavy, being filled with high-grade sulphurets—in fact there were more sulphurets than quartz. Free gold was also a noticeable feature, a streak appearing to extend entirely through the specimen. About 450 tons of rock are now on the dump and the company will soon have a mill erected with which to crush the same, being under course of construction now. The stormy weather is somewhat of a drawback to its erection but that difficulty will no doubt soon be overcome, as storms do not last forever. Evidently the owners have a bright prospect ahead, which time will demonstrate. Nothing has yet been realized from this lead but it promises much. When the mine gets to working on a larger scale than at present, numerous men will be employed, thus not only being a source of revenue to the company but will put into general circulation a great deal of money. The Nevada County is bound to be a dividend-payer at no distant day.

A GOOD CLEANUP.—Foothill Tidings, Dec. 24: The wheel mine has just completed a cleanup of 20 loads of ore at Patrick Rogers' mill, and the result is a bar of gold valued at \$1647. This does not include sulphurets. Since the mine has been lately worked there have been, altogether, 80 loads of ore crushed, yielding in the aggregate over \$5000 in gold. The mine is located on Wolf creek, and used to be known as the Granite Hill.

Placer.

IOWA HILL.—Placer Argus, Dec. 24: We are having beautiful weather, but the season so far has not been favorable for mining. The drift claims are worked, and we here occasionally of a rich strike when the nuggets are brought to town. Nearly all the younger men are at work in the claims. A few antiquated old fossils air their grizzled looks around the corner grocery, while they discuss that never failing topic, the weather.

Plumas.

GREEN MOUNTAIN MINE.—Greenville Bulletin, Dec. 26: Work continues with regularity in this mine, and the mill runs steadily. The power drills were started Monday in the face of No. 6 tunnel, which will be driven ahead to the next chute before any stoppage will be made. Mr. Vernam recently made a new survey of the mine for the information of the company. He left for New York last week.

Shasta.

CHURNTOWN CROPPINGS.—Cor. Shasta Democrat, Dec. 23: As placer and quartz mining is the chief industry, more attention is given to that than anything else, and grand idea of all is to uncover as much bedrock in the shortest time possible. There are no laggards here; rain or shine the work goes on, and if we don't make a good showing upon Uncle Sam's balance sheet, as regards the yield of placer gold from this district, the fault does not lie with the workmen. As to quartz, there is nothing doing in the line of prospecting, or developing those claims already located, north of Churntown, but in the Old Diggings everything is booming.

MILL AND MINE.—Shasta Co. Democrat, Dec. 16: More machinery for Iron Mountain arrived Monday. Senator Foster was in town a few days ago looking after his mining interests. The Clark mill is now making successful runs under the skillful management of "Bije" Bemis. Whitton, Bassett & Stocks think they will be able to erect a mill on their Squaw creek mines within 90 days. Yesterday Peter Shearer struck a new tellurium vein on his ground. The quartz shows rich in sylvanite sulphurets. A. P. Minear of Deadwood was up at Squaw creek Thursday and Friday looking at the fine prospects in that camp. S. S. Stickley is preparing to open an assay office at Buckeye. Friend Stickley thoroughly understands the business. Preach Ten Eyke is hauling quartz from Haskell & Co.'s mine on Sick Rock to Merithew & Co.'s mill at Lower Springs. "Bije" Bemis and Tom Harrison intend to put up a custom mill in the Old Diggings district as soon as possible. The machinery has been purchased. Rudolph Seltzer is interested in a fine prospect in the Deadwood district. The vein is about half a mile from the McDonald mine, and the rock prospects first rate in free gold. A new strike was made last week in Weil, Conroy & Murray's mine on Flat creek. A vein of high-grade ore four feet wide was struck in the west end of the lower level, which has greatly elated the owners. Friday Peter Shearer purchased from a couple of Frenchmen a piece of land that he sold them about a year ago. The ground extends from the mouth of Gold Run east about 40 rods, and is thought to be valuable in gold quartz. Peter Shearer has bonded a piece of mining ground on his land to a man by the name of Williams of San Francisco. The ground lays along the railroad track and the vein matter of the claim was exposed by the excavations of the railroad company for roadbed. Ollie Whitton last week sold half of his interest in the Carrie Houston, Lillian Maude and Rose Blossom gold mines on Squaw creek to Col. Stocks, which gives each a fourth interest. Geo. Bassett owning the remaining half. It is their intention now to put a mill on the property as soon as possible. Bell & Co.'s new mill at French Gulch is about ready to be set to work. Hon. Renben Clark is thinking of erecting chlorine works on his mine at Quartz Hill. A carload of sulphurets were shipped from the French Gulch mines a few days ago. Carson has started a tunnel on his mine on Squaw creek. It will tap a rich chute of ore about 100 feet deep. The engine to furnish the power for the Iron Mountain milling machinery arrived last Saturday. It weighs 9000 pounds. Mr. Lowden of French Gulch has been up on Squaw creek for a week past. He thinks the mining prospects there are immense. About 170 men are now employed at Iron Mountain. It is expected that that number will be more than doubled next spring. John Langden and Pehrm are hauling Hart & Day's quartz mill machinery to the mine, and Lee Fader the Iron Mountain machinery, of which there is about 400,000 pounds. It is rumored that Jack Conant has sold the remainder of his claims on Squaw creek to Reilly, Mathews & Co. Parties who came up from San Francisco

Monday say it is so understood there. We learnt that a large company is being formed in Red Bluff that will incorporate and take hold of considerable mining property in the Bullychoop district. Senator Foster is at the head of it. We are told that a few days ago an old prospector struck a very rich quartz ledge in the vicinity of Salt creek, which is similar in character to the tellurium mine. The rock is said to be very rich in free gold. The quartz mill, engine, concentrators and other machinery for Hart, Day & Co., arrived last Thursday night and has been hauled out to the mine. Slowly but surely Old Diggings district is coming to the front. About two weeks ago Sanders & Whitlow sold their mine on Dog creek to a San Francisco company, which, we are informed, has since incorporated with a capital stock of \$300,000. Milling machinery will be erected on the mine early in the spring. Says the Scott Valley News: Tom Minot & Co. have in two years taken out of the river bed upwards of two hundred pounds of gold dust. Tom, after 30 years in the mines has bid farewell to his friends in this section and gone to Texas. The balance of the company intend to work about seven hundred feet more of the Klamath river bend next year, and then steamboats can run from Humburg to Linkville. The dam of the old Townsend Flat ditch at Briggsville was washed out by the recent freshets. This will open the Horsetown Flats to placer miners, and there is said to be considerable good ground in that locality. This dam has been there for 30 years, and has prevented the working of this ground by holding and backing tailings, virtually locking up some of the richest placer ground in northern California. Hon. George C. Perkins and others, who were here last week investigating the Scheerer tellurium mine, have, so we are told, interested themselves with Mr. Robinson for the purpose of erecting milling machinery on said mine—Robinson having an agreement with Mr. Scheerer stipulating that he (Robinson) should erect machinery for reducing the ore for one-fourth of the proceeds. Hart, Day & Co., the new proprietors of the Fleming mines in Old Diggings district, have erected the building for their mill and will have the road from the mill to the mines completed this week. Their machinery, which is expected here tomorrow, consists of five 750-pound stamps, and two Duncan concentrators, a new patent said to be superior to any now in use. The mill is equipped with all the latest improvements and will doubtless be the model concern of the county. As Mr. Hart is a thorough miner and mill man, we may safely look for good results.

Sierra.

RUNNING FULL BLAST.—Tribune, Dec. 20: Antone Demartine informed a Tribune reporter this week that the new mill at the Cleveland mine was running in full blast, and that so far the machinery goes like clockwork. The plates are looking well and it is anticipated that a handsome cleanup will be made on the first of the month. The mine continues to look as flattering as usual.

TUNNEL.—Mountain Messenger, Dec. 26: The Lincoln and Empire Co.'s, of Howland Flat, have entered into an agreement to run a tunnel for the further development of their separate mining claims. Sunday, Dec. 13th, the Ruby Co., Forest City, cleaned up 219 ounces of gold. There are 35 men working, 20 of whom breast gravel.

REO OAK.—Everything progresses favorably at the Red Oak drift mine. By the time spring opens, the company will have the development completed and the property in working order.

EXTENSION.—The cleanup at the Bald Mt. Extension, Forest City, Sunday, was 260 ounces and 18 pennyweights—was nice a lot of bright and pretty coarse gold ever mined in Sierra, reminding old-timers of the days of '49. One nugget weighed 6 ounces and 6 pennyweights. The Rocky Peak and Bunker Hill Mining Co.'s have combined to run a tunnel on their claims, and have let a contract for 200 feet to Adam Walker and Henry Morse. The location of these claims is near Brandy City. The Brandy City Mining Co. has completed over 500 feet of its bedrock tunnel, which is designed to afford an outlet into Canyon creek. A steam drill and 12 men, working three shafts each 24 hours, are doing the work. About three feet a day is made.

Sierraview.

ORO FINO.—Cor. Yreka Union, Dec. 24: Quite a revival has taken place in the past month in quartz interests. The recent soft spell of weather has furnished the miners with an abundance of water to crush their ore, which has given life and vigor to the camp. John Pitz & Co. have crushed 20 tons which have paid \$27 to the ton. Conner & Co. crushed 28 tons which yielded \$24 a ton. Carson & Co. have just cleaned up a crushing of 40 tons with good results—I have not learned the exact amount. Christian Schell, better known as Old Felta, has struck a lode at the head of Taylor Creek, one-half mile west of his cabin, which is the richest find in Oro Fino district. Some say there is \$10,000 in sight. I have not visited the mine yet. The rock is of a greenish cast. The frosty nights are fast closing out the placer mines, there being a scant supply of water for one claim. The Eastlick elevator has proved a grand success. Wright & Fletcher have their pipe and elevator well along and will soon be ready for water.

Tuolumne.

GOLD BRICK.—Tuolumne Independent, Dec. 26: A gold brick, valued at \$1500, was the cleanup of a pocket struck at the Biddle & Whitehouse claim at French camp. Messrs. Stucker & Gale got \$500 out of a pocket on Bald mountain. Messrs. Stevens & O'Hara were also fortunate. The amount we did not learn.

PROSPEROUS OUTLOOK.—Union Democrat, Dec. 26: Miners in this section predict they will have a prosperous time the coming season. Heavy bodies of snow in the mountains warrant a good supply of water which was lacking the last two years. Movements are visible in different directions in the way of preparations for opening and working various mines. On the mother lode near Jamestown there is already considerable activity. The Crystalline is being worked with a full force, and is constantly yielding; the Alabama mill will soon be running; a large quantity of good ore has been opened up and is being placed on the dump for crushing when the mill is ready. The Little Gem mine is at work. The Buchanan mine in the mountains has been running the last 30 days. Active operations are going on at the Hyde mine, and at several other mines work is in progress, or the owners are getting ready.

The outlook now is good, better than for the past two years, imparting high hopes to all engaged in mining. The great number of leads in the county makes this a good field for men with means to prospect. Now that the Constock and other large lodes are exhausted such mining territories as that of Tuolumne will be sought after. If there is not so much gold in these regions as there was in the celebrated mines of other places that have become exhausted, there will be a profit in them for many years to come.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Enterprise, Dec. 26: On the 3100 level the long diamond drill hole from the face of the main north lateral drift is being steadily followed down north toward the Savage line, the drift being advanced at the very good rate of about 45 feet per week. The end of the drill hole is nearly reached, and the face of the drift is less than 100 feet from the Savage south line. It is to be steadily advanced onward into the Savage mine and through it to the Best and Belcher, the course of the drift being in the direction of that shaft. The material met with in the face of this drift is vein porphyry, with streaks and bunches of good ore occasionally, and no water to trouble. On the 3000 level the upraising in the good ore body above the deep winze station continues, but owing to the lack of hoisting facilities by the Combination shaft being engaged in sinking, no ore is being raised to the surface, but allowed to accumulate on storage in the drifts.

CHOLLAR.—The drain boxes throughout the main lateral drift south on the 3100 level are all in, very effectually carrying off the water which was recently struck at the Potosi line. Further work is necessarily suspended at present, pending the sinking of the Combination shaft 100 feet deeper, or to the 3200 level. Very good progress is being made in sinking this shaft, the material being favorable, and when the 3200 level is reached, the bottom of the shaft should be in the ore vein, or very near to it, allowing for the regular easterly dip or inclination of the vein, gaining toward the vertical course of the shaft. It is calculated that the shaft will be completed to the 3200 level inside of two months. It is now down 40 feet below the 3100 level, and in the course of eight or ten days the plates will be lowered, which will give more room and facility for hoisting waste and ore from the Hale and Norcross, or from the Chollar, if required. The opening made in sinking this mammoth four-compartment shaft is 12 feet wide by 32 feet long, involving the removal and hoisting of a large amount of debris. Good work has been done during the week getting in the drain boxes throughout the entire length of the main lateral drift south on the 3100 level, a distance of 640 feet. The work will be completed in a day or two, the boxes being well covered throughout, in order to not only carry off the hot water but the condensing steam also. The water was struck when the drift reached the north line of the Potosi mine, and we are informed that about tomorrow or next day it is the intention to bulkhead the end or south face of the drift in the most effectual manner possible. This is in order to shut out the flow of water from there, which amounts to several inches and is not wanted. The pumps and everything at the Combination shaft is working finely, and as well as could be desired.

GOULD AND CURRY.—Crosscut No. 2 west on the 1000 level is being steadily advanced in very promising ground, being now about 300 feet in length. At the annual meeting of the stockholders in San Francisco last Monday there was a light change in the control and management, and it was decided to resume explorations at the lower levels and sink the Osbiston shaft of the mine to a corresponding level with the bottom of the Combination shaft and the lower levels of the Chollar, Norcross and Savage mines. The pumps at the Osbiston shaft will be started up after the 1st of January, and the 500 feet in depth of water at the bottom, filling all the drifts and workings of the lower levels, pumped out, after which sinking deeper will be commenced. This shaft is already 2500 feet deep, therefore it will only have 400 or 500 feet deeper to go in order to reach the 3100 or 3200 level of the Combination shaft and its mines connected. The top or surface of the Osbiston shaft is just 171 feet below the top or surface of the Combination shaft. On the 1000 level west crosscut No. 2, 170 feet south of the north line, is now in 288 feet. Face in dry vein porphyry with streaks of clay and quartz.

CON. CALIFORNIA AND VIRGINIA.—The slopes and breasts on the 1750 level still keep up their regular yield of 125 tons per day, assaying \$16 per ton from battery samples at the Morgan mill. The northwest drift on the 1650 level has been advanced 32 feet, making a total length of 357 feet. The Jones lease of the upper levels of this mine, above the 1500 level having been canceled since last week's report, the ground included has reverted back to the company, and the whole is under the efficient direction of Superintendent Patton. The Jones lease section last week, under the closing contract, yielded 1500 tons, assaying \$20.70 per ton from Eureka mill battery samples. On the 1650 level the northwest drift toward the old bonanza workings is now in 317 feet, 34 feet having been made during the week. The ore stopes and breasts on the 1750 continue their regular daily yield of 125 tons per day, as assaying, according to battery samples at the Morgan mill, \$26 per ton, quite an increase over the previous week. The Jones lease section, above the 1500 level is turning out over 200 tons per day, of the average assay value, from Eureka mill battery samples of \$25 per ton. There is a large amount of ore yet in sight, the old stopes and breasts holding out well.

CROWN POINT.—The usual supply of ore about 400 tons per day, continues to be yielded from this mine and the Belcher, principally from the old upper workings, which hold out admirably. Quite a considerable portion of this, however, comes from the 1700 and 1750 levels. The upraise from the 1700 level, to connect with the 1600 level was completed last Monday. This gives a splendid and much needed circulation of air, and greatly facilitates ore extraction and exploration at the lower levels. The old upper levels continue their large regular yield from both this mine and the Belcher. Most of the ore comes from above the 1400 level, but the best in quality is from the 1700 and 1750 levels, the

(Concluded on page 13.)

White Bronze.

For years white bronze has been used in Europe for monuments and statues, but they

were not admitted, the art foundry was enlarged and a corporation, the Monumental Bronze Company, was formed with \$300,000 capital. In 1881 a western establishment was

ments and statuary ordered in the West; but it soon became evident to the managers that another foundry west of Detroit was a necessity, and in 1884 the Western White Bronze Com-

pany and the work has been sold in every State and Territory in the Union. The material is lasting in its nature, and the facility with which it is moulded into the most artistic de-

were not introduced in this country until 1874. Their intrinsic merit soon began to attract attention, and a year or two later some capitalists established a small art foundry at Bridgeport, Connecticut. The demand for the work increased, more capital was invested, new part-

ners were admitted, the art foundry was enlarged and a corporation, the Monumental Bronze Company, was organized. In 1882 Canada came forward with a claim, and the St. Thomas White Bronze Monument Company was organized at St. Thomas, Ontario. The Detroit Company produced for a short time, the monu-

ments and statuary ordered in the West; but it soon became evident to the managers that another foundry west of Detroit was a necessity, and in 1884 the Western White Bronze Com-

pany was established at Des Moines, Iowa. The highest artistic talent is now employed, and the monuments and statuary produced challenge comparison with the best products of the art foundries of Europe. White bronze agencies are now established in every prominent

city and the work has been sold in every State and Territory in the Union. The material is lasting in its nature, and the facility with which it is moulded into the most artistic de-

signs will ultimately make white bronze more popular for art work than the copper or antique bronze which has heretofore been used so extensively.

The name white bronze was adopted for this perfected and finished material, as an appropri-

ate one to distinguish it from the dark or antique bronze; also, from the cheap statues made of sheet metal. It is claimed by the manufacturers that white bronze, as now made, is so well adapted to monumental purposes that it will ultimately supersede all other materials. Experience has enabled the producers to overcome the many obstacles that at first presented themselves, principal among which was the difficulty of obtaining metal sufficiently purified to retain its color; this has been entirely overcome.

The monuments and statuary are cast as thick, or thicker than copper bronze. The designs are first modeled in clay, and reproduced in plaster of Paris, from which a wax cast is taken, this cast being necessary, in order to procure a perfect metal pattern, from which the monument is molded and cast in the ordinary way.

The illustrations on page 9, which we take from the *Scientific American*, show two important features in the production of this work, one being the fusing and joining together of the different parts by pouring molten metal of the same material as the castings, at a high degree of heat, along the joints; this makes them practically one solid piece, and the corners the strongest part of the work.

The other illustration is that of the application of the sand blast, which gives the surface of the work a pleasing appearance which it always retains, being in this respect superior to copper bronze, which soon after exposure becomes black and unattractive.

The work of finishing and preparing for the sand blast requires a high degree of artistic and mechanical skill; with the exception of the sand blast, all the finishing is hand work, and necessarily expensive.

Metal possesses many advantages over stone for monumental purposes aside from its greater durability; the positive assurance of the raised lettering or inscriptions remaining legible for ages, is itself worthy of appreciation, as the value of any monument lies in its ability to legibly retain its record. The monuments are made with removable tablets, for the purpose of adding inscriptions in the future. White bronze is also free from the discoloring influences of trees or growths of moss or mildew, and is not affected in the least by the elements of the atmosphere so destructive to stone.

It is stated that the granitic obelisk in Paris, which has only been erected there forty years, has so far decayed that the French Government have taken plaster casts of the surface to preserve the inscriptions for historic use; and our own obelisk, which has only been in Central Park for five years, is already disintegrating from the effects of this climate, and scientific men have been called upon to devise means for its preservation, while the old metal and bronze monuments in Europe, that have stood for centuries in the most rigorous climates, are still as perfect as when new.

Monuments and statuary for cemetery purposes are produced of all sizes, styles and designs, competent artists being constantly engaged in modeling original monumental designs, as well as statues, portrait busts, medallions, etc., to be used in connection with granite and bronze monumental work. Our illustration shows the artist's studio at the Bridgeport foundry. Among the recent productions were life-sized busts of Martin Luther, for Allentown, Pa.; Sergeant Major Reynolds, of Brooklyn, N. Y., recently unveiled in Greenwood Cemetery; and statue of Pilot Woolsey, erected in Evergreen Cemetery. A large number of white bronze public monuments have been erected, prominent among them being the one shown on our front page, recently unveiled at Grand Rapids, Mich., which was cast at the Detroit foundry. As a monumental fountain it undoubtedly surpasses all previous productions of this nature that have come to our notice.

We illustrate the different art foundries engaged in the production of white bronze, as well as the exhibit made at the World's Fair, New Orleans, at which the goode were awarded the gold medal; a gold medal was also awarded white bronze at the Southern Exposition, Louisville, Kentucky, last fall, also a medal awarded them at the American Institute Fair, 1884, where a fine display of statuary can now be seen. The work is produced exclusively by the Monumental Bronze Company, Bridgeport, Conn., the Detroit Bronze Company, De-

troit, Mich., the Western White Bronze Company, Des Moines, Ia., the American White Bronze Co., Chicago, Ill., and the St. Thomas White Bronze Monument Co., of St. Thomas, Ont. It is expected that other foundries will soon be established in the West and Southwest.

The time honored custom of using marble and granite for monumental purposes, and the faith that seems to prevail in the enduring qualities of the products of the "everlasting hills," naturally cause a strong opposition to the introduction of metal in this connection, but careful observers have long since noted the shortcomings of marble and granite when exposed for any length of time to atmospheric influences, and they are not content to intrust their family records to such perishable material.

The production of white bronze monuments and statuary, has, until recently, been prosecuted in a quiet, unostentatious way; but with the addition of needed improvements and increased capital, so great has been the development during the past few years, that four foundries are now required to supply the rapidly increasing demand. We are living in the age of telegraphs, telephones, electricity for lights and motive power, and many other useful improvements, all of which have a value in their peculiar uses, and so with the subject of our sketch. The general agent for this coast, Mr. James Linforth, 116 Front St., in this city, will take pleasure in exhibiting to those who wish, various specimens of this white bronze work, and explain more fully to them its peculiarities.

The Sierra Buttes Mine.

EDITORS PRESS:—The Sierra Buttes mine has been in active and continuous operation for 34 years. It was originally discovered by some Mexicans, and has been one of the largest gold producers in the world's history. It is owned by an English company, and the head office is in London, with a branch office in San Francisco. Mr. William Johns is the General Manager of the mines owned by this company. The Sierra Buttes is under the able management of Mr. Thos. Preston, who has been in the employ of the company for about 13 years, and from Mr. Preston's known business abilities, assisted by Capt. Wm. James, of the underground work, and the office staff—Messrs. Briggs and Hopper, together with Mr. Woodward, the millwright, Mr. Maltman, the assayer, and Messrs. Carney, McGregor and Black, millmen, the mine has been brought to its present state of efficiency and successful working.

The mine is located on the southern slope of the Sierra Buttes mountains; the lower works are situated on the North Yuba river. The mine employs at the present time 250 men, which is the average all the year round. The mine is worked by a series of tunnels or levels, from Nos. 1 to 9, but only, 6, 7, 8 and 9 are at present operating. The lowest of these, No. 9, has been run 6400 feet, and up to the present time not a pound of ore has been extracted from it. For over 3000 feet this tunnel has been run on the course of the vein, which has varied from 6 to 15 feet in width, all of which has been of too low a grade to be profitably worked. A raise is now being put up to the 8th level, which, when completed, will be about 750 feet. The 8th level is the level from which the ore is now extracted which supplies this mill. The average yield of ore that was extracted last month was \$5.50 per ton; the cost of mining and milling, \$3.98. It is a 60-stamp mill, which is kept constantly running. It is run by water power; three wheels are used for driving the machinery. There are 24 Frue concentrators for concentrating the sulphurets. The sulphurets are afterwards reduced by means of a reverberatory furnace. After roasting, they undergo the process of chlorination. The chlorination works have only recently been erected, and are now in successful operation. They are the most complete and compact in the State, and contain all the latest improvements.

The company board their men in two commodious boarding houses. These boarding houses are remarkable for their cleanliness, and the good order which prevails. The spacious drying-rooms for the miners to change their clothing after coming from the mines, is duly appreciated, as also the reading-room, which the company has not lost sight of. Mr. Preston has kindly invited your correspondent to partake of a dinner, that was awaiting the miners as they came from their work, and I must say that the soup, good fresh beef, and the heat of vegetables, pudding, pastry, etc., was such as the most critical could desire.

The company are entitled to credit for the general interest they take in their employees, welfare, as nothing seems wanting to make them comfortable. In case of any accident, they are placed on half pay, and all men have medical attendance, which is very efficiently and satisfactorily supplied by Dr. W. O. Buckland, who is remarkable for his attention and

courtesy, and consequently extremely popular with the men. There is a brass band, consisting of 16 performers, which enliven the camp by playing selections three times a week, which the employees seem much to appreciate. *Sierra City, Sierra Co.* M. L. D.

Condensing Flue Dust.

Use of Electricity for the Condensation of Metallic Fumes.

(Translated from the GERMAN for MINING AND SCIENTIFIC PRESS by CHARLES A. SCHENCK.)

A new and most interesting process for the condensation of metallic fumes has recently been made public in England by Mr. Alfred O. Walker, a process which appears to be especially adapted to the working of lead ores, but which may also be successfully employed in other metallurgical works.

Prof. C. I. Lodge delivered, at Liverpool a few months ago, a very instructive lecture on "Dust," in which he took pains to describe the very remarkable effect produced by electricity on the dust floating in air, a phenomenon first studied by him.

Metallic magnesium, when burned under a bell-glass, fills the enclosed space with a thick white smoke of magnesia, which, under ordinary circumstances, settles only after a long while. Introduce, now, into the bell glass a metallic wire, for instance a copper wire, which with one end is attached to one pole of an electric machine, and at the other end terminates under the bell-glass with one or more needle-shaped points; connect the other pole of the machine with the earth and a very decided effect will be produced as soon as the machine is set in motion. The white and dense fog commences to move at once, rapidly rolling about in vortex-like curves, especially near the needle-shaped points; fine particles, first approaching one another, combine, and the fog, being changed into flakes, resembles fine snow, which settles quickly, especially on the sides of the bell-glass. After a few seconds the suspended smoke has entirely disappeared.

Similar experiments can be made with other substances, for instance, with the thick smoke from burning tar, and even with the smoke from paper which is quite light. The same phenomena are produced every time; the particles of smoke and dust may be as fine as their nature permits, and under ordinary circumstances not inclined to settle at all, they accumulate and settle at once under the effect of the electric current, flowing out of the metallic points.

All this was discussed by Professor Lodge in his lecture and clearly proved by experiments. This lecture was afterwards published in *Nature*, by which means Mr. Alfred O. Walker first heard of it. This gentleman is a member of the well-known firm of Walker, Parker & Co., the largest manufacturers of lead and lead products in England and owners of several extensive establishments—and he perceived at once that the discoveries of the Professor might be utilized for a profitable condensation of the fumes of lead, the so-called "flue dust." He informed Professor Lodge of his plans and, after some consultation with him, commenced a series of new experiments at the Dee Bank Lead Works, near Baglit, in Flintshire, with the assistance of the superintendent, Mr. W. M. Hutchings, and the scientific aid of Professor Lodge.

These experiments were continued during several months and, to the satisfaction of all concerned, it was clearly shown that the fumes in the flues of a furnace are acted upon by electricity in the same energetic manner as the magnesia smoke under a bell-glass.

In these experiments Mr. Walker did not make direct use of the main flue, as it would have been nearly impossible to make observations in the darkened canal. He made an opening in one of its sides, at a point not far from the furnace, which opening communicated directly with a longitudinal wooden box, provided with windows for the purpose of watching the work. By means of a slide in the main flue, a variable amount of smoke could be led into the box, and through it into the air. By pushing down this slide to the bottom of the main flue, the entire pressure of smoke from a long row of furnaces might be likewise forced through the box, by which means a very strong and rapid current of fumes and gases was obtained for observation. The exterior end of the box was also provided with a sliding door to shut in the smoke *ad libitum* after it had been filled, so that the smoke enclosed in this camera could be observed with ease, when it had come to rest.

The electric machine, used in the experiments, generated electricity by induction, and was built after the system of Voss; its rotating plate of glass had a diameter of 18 inches; it was put up in a small room next the wooden flue. An insulated copper wire communicated with the upper end of a conductor, which was fastened to the cover of the wooden flue, so that it reached about half way between its top and bottom. This conductor was made of copper one-fourth of an inch in thickness, and enclosed in a three-fourth inch tube of glass, to prevent the smoke, as much as possible, from coming in contact with it; it was suspended between two opposite windows. At its lower end, where it issued out of the glass tube, differently

constructed systems of metallic points could be attached for the flow of the electric current. Copper bars, straight, or in the form of a cross or bent into rings, provided with needle-like points, were alternatively used in these experiments.

After the correction of some small mistakes, in regard to the insulation of the wire and the conductor suspended in the canal, the experiments gave entire satisfaction.

This wooden canal being filled with smoke, the two sliding doors at the entrance and exit were pushed down at the same time and the machine was set in motion. The plumbiferous fog, exhibiting a vigorous vortex-like motion, was at once changed into snow and the inside of the box cleared up in a very short time. But the effect of the electricity was not less surprising if the smoke was made to flow through it with full velocity, passing out into air. At its exit this dust changed completely, forming accumulations of a flaky nature, which in a quiet air settled rapidly on the ground. Suddenly interrupting the current of smoke and looking from the exit into the box, it could again be seen that the smoke, after passing the metallic points, settled quickly, in a trifling distance from the conductor and consisting almost entirely of flakes.

In short, it was completely proven that the effect of electricity on smoke or dust in a wooden flue, whether it be at rest or moving on with the full draft of the chimney, and under all possible degrees of heat, proportions of steam and acid, is decidedly the same as it is under a bell-glass on the table of the laboratory.

Two things only have to be looked at to insure complete success: 1, wire and conductor down to the middle of the canal must be well insulated and 2, a sufficient number of metallic points must be uniformly distributed over the lateral canal section. Points as well as the bars to which they are fastened get thickly covered with the condensed dust; but this does not appear to produce any detrimental effect in the working of the machines. It may, perhaps, do so after long use, and in such a case the remedy readily suggests itself. The manner of connecting the bars, provided with the needle-shaped points, with the lower end of the conductor must be such that they may be easily taken out and brushed off.

Walker, Parker & Co. have now decided to introduce this process on a large scale in their establishments. Two large electric machines are being constructed, which will need a motor of one-horse power. They will be built after the system of Wimshurst, generating electricity by induction, with rotating plates of glass 5 feet in diameter. The Wimshurst machine is almost entirely independent of the hygrometric state of the atmosphere, and at the same time so simple in all its parts, that it is well adapted for effective and constant work. In the working plan on a large scale the smoke in the main flue passes in succession two or perhaps three rows of metallic points, having a distance of a few metres between them. By such an arrangement the strong effect of the electricity flowing from the first row is supported, continued and finished by the following, so that the flaky accumulations of smoke and dust must quickly settle.

Mr. Walker has taken out patents for England and other countries which, besides the condensation of lead, cover all other metallurgical vapors as zinc, oxide of zinc, mercury, etc.

That this new and simple way of condensing the smoke of furnaces will very soon be adopted by all lead works of any importance cannot be doubted. The cost of the plant is only a small one, and no interruption in the routine work of the furnace need be anticipated from its employment.

All other proposed mechanical contrivances for condensing the furnace dust have so far been of little practical value on account of the heavy outlay for the plant, and the heavy running expenses; and also on account of the irregularities and frequent interruptions which are caused by them in the draft. Long flues and systems of flue-chambers are also very expensive, and considering the necessity of a good draft, can only be employed to a limited extent, so that the loss of metal from escaping fumes, even in the best case, must still be considerable. Enormous sums are lost every year in the form of lead fumes, and in the best constructed establishments, with extensive flues and flue-chambers.

Considering on the other hand, Mr. Walker's new way, even a short flue will do good work, because the electrified and flaky dust will settle very soon, and cannot be carried away for any great distance.

The outlay for the whole plant, even for the largest establishment, will be a small one, consisting of two electric machines with conductors and wires, and a motor of about one-horse power.

We owe it to the sagacity and practical insight of Mr. Alfred Walker, that the very interesting experiments of Professor Lodge, have so soon found application in the metallurgical industry, and a striking proof has thereby been rendered again of the many and sometimes quite unexpected directions, in which the studies and experiments of "pure science" can be made useful in practical life.

VESEVIVUS, according to dispatches of Nov. 16, is again in a state of eruption. The lava at that date was streaming down the west side of the mountain, and some alarm was felt that a more serious display of activity might be made.

A Miner's Views on the Silver Question.

EDITORS PRESS:—The following ideas were suggested to me after reading that part of the President's message relating to silver coinage: If the Government of the United States would positively (by enactment) say that 412½ grains of silver shall have a value of 100 cents when coined and stamped, by the proper authority of the Government, and make it a legal tender, for all dues, public and private, we may coin \$100,000,000 annually; and I would defy the combination of all our bankers and money shavers of this country, and the combination of the same class that is now controlling the Government of Europe, to affect or depreciate our silver dollar, and thereby affect the working and producing classes of this country.

If European bankers and money shavers want our gold, how are they going to get it without giving us an equivalent for it? We are not dependent upon foreign Governments or our bankers for our gold and silver. We are dependent upon our miners for it; and for the gold and silver we get from foreign countries, we are dependent upon our own mechanics and producers.

The production, under this Government, of the toiling millions, is the wealth of this great country.

Our President, in his recent message, seems to have ignored this class entirely, and taken up with the interest of the banker and financier, as the important factors of this Government. They have taken the position of figurehead to the ship, and claim that they have brought the ship, with her valuable cargo, into port. Our President is like the boy who thought the figurehead brought the ship into port.

It requires but a very superficial examination of this gold and silver question to see that the issue is between the toiling millions of producers and mechanics that are making this country one of the richest in the world, and our bankers, and money shavers and politicians in their employ.

It is time that our President and Representatives should know that the millions of producers and mechanics are the operating power that is producing the wealth of this country. Out of this element came the cabin, the farm, the mine, the village, the city. All the complicated machinery, the suspension bridges, telegraph lines, the great railroads, all the complicated appliances that give comfort to modern civilization, came from the skilled labor of the producer and mechanic. Out of this element came the soldier that made up our great armies. For almost five sad years did they battle for our country, in rain and storm, summer and winter, without shelter—laid down their lives by the thousands, until the aggregate was hundreds of thousands. The wailing of the father, mother, widow and orphans could be heard throughout the land.

For the rank and file, these men were paid \$16 per month, and that in greenbacks. They took it in good faith. Now, excuse the digression, but what did the bankers do? The record shows they depreciated this hard-earned currency as low as 70 per cent below its face value, and made it a means of speculation by which they made millions (of profits) off of the needs of the soldier, widow and orphans. The nation is ashamed to read this record, and yet these bankers have the impudence to tamper with our President and Representatives, and ask them to legislate for their exclusive benefit by stopping the coinage of our silver dollar, and have no standard value for it, thereby giving the banker a chance to manipulate its value at their option. This is a terrible thing to contemplate—that our silver coin shall be subject to depreciation 15 or 20 per cent, at the option of a few bankers. Say we have about \$220,000,000 coined; a depreciation of 15 per cent means a loss of \$33,000,000.

Do our President and Representatives ask the people to allow this? It is time they should know that the people demand a stop put to speculation on our Government money. And it is time for them to know that the people demand that all Government dues be paid in coin, as per agreement, and such as is received by the Government Treasury. It is time for them to know that the people demand a payment of all interest-bearing debts of the Government, if it takes the last dollar in the United States Treasury.

The cause of our Government locking up hundreds of millions of dollars, comes from the manipulating of our Representatives by the bankers. It is a very strange thing that our Representatives will lock up hundreds of millions of dollars, and then ask the people to pay interest on it. I say pay these bankers off as long as there is a gold or silver dollar in the United States Treasury.

And then start up all the mints to coining, if it is \$100,000,000 annually. Make silver legal tender for all dues, public and private. To the miner give silver and gold certificates for his haul; coin it all and pay the Government debts with it. The miners will take their certificates very willingly and not charge any interest for so doing. Where is the difference in the convenience of having a thousand dollars in silver certificates, and having a thousand dollars in gold certificates? If our Government wants to pay any foreign debt that she may owe, the producers and mechanics of this country can let her have \$1,000,000,000 worth of merchandise annually that foreign countries

must have to sustain the comforts of life, and willingly take it, the pay, in silver certificates. If any crank wants gold certificates let him have them, or coin. All we want to know is that no man, or association of men, dare to depreciate the coin of this Government. I say not reduce the taxes until all interest-bearing debts of the Government are paid in coin. It is time that our financial sharpers and bankers, with their political tricksters, to know that we can spare them and all the gold they own with less loss than any other item that can be named. Suppose we banish these gold kings to some lone island in the Pacific Ocean. When they got real hungry Uncle Sam would send them a ship loaded with potatoes, stamped, worth \$20 in gold apiece. Would they refuse to take that kind of coin? I guess not. Their eyes would be opened for the first time, to the fact that the wealth of a country is its productions of food and clothing, with skilled appliances for obtaining it. This is the condition of Europe. They are dependent upon this country for a large portion of the necessities of civilized life. We are the most important member of the civilized portion of the world. As the years roll by, our importance will increase. No nation will be independent of the want of some of our merchandise. Our Government coin will command its face valuation in any part of the earth, let it be gold or silver, or certificates of gold or silver.

It is time for our representatives to know that this is to be our condition in the near future. Give us a standard gold and silver coin, lock up no coin; pay all Government indebtedness in coin; stop legislating for bankers exclusively; encourage mining; coin the hullion as fast as it is produced; encourage the manufacturing, the mechanic and the producer; cover the ocean with merchant ships and a navy to protect them. Stop all deception and fraud in all departments of the Government and the people will make this the richest country the world ever saw.

MINER.

Testing and Working Silver Ores

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation; test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protodichloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patehen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Krichak's process, etc. Under "Pulverizing Machines" are described the Austria and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

About Obtaining Patents.

Patents are Virtually Contracts

Between inventors and the public. The consideration flowing from both parties to the contract is expressly fixed by statute. The Government requires the following consideration in every case: First, that an applicant for a patent shall disclose a new and useful improvement, of which he is the first and original inventor. Second, that the invention has not been patented, or published in a printed publication prior to the date of his invention. Third, that the invention has not been in public use, or on sale, more than two years prior to his application for a patent. Fourth, that the invention shall be properly described and claimed in the specification forming a part of the patent. Provided an inventor complies strictly with these conditions, the Government guarantees that the inventor shall have the exclusive right to make, use and sell the thing invented for the term of seventeen years.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. This question can often be answered gratuitously by us, immediately on receiving full information of the invention, by reason of our long and extensive practice as patent solicitors and editors and publishers of first-class, scientific and industrial journals, during the past 20 years and over. When the question of priority of invention is not so readily to be determined, it is generally best to make what is termed a "preliminary examination," by searching through the patent office reports among the patents in the class to which the invention relates, and referring to our extensive patent library, containing compilations of special classes of American and foreign inventions, mechanical dictionaries, scientific encyclopedias, files of scientific and mechanical newspapers, and an immense number of patent applications by inventors of the Pacific coast, carefully filed by this office since 1860.

If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of \$5 for the examination, a verbal or written report showing definitely whereby his invention has been anticipated, thereby saving him further expense and perhaps much time, useless delay, anxiety, etc.

To avoid all unnecessary delay, however, in securing patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately, and forwarded to the inventor for his signature. When the inventor receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps to be taken.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of \$30 to us, we will order the issue of the patent, and forward this same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretence of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give a case up as long as there is a chance to obtain a patent. The agency charge is from \$25 to \$30, or sometimes more, if the invention is intricate or complicated, or requires much labor. Drawings cost from \$5 upward, according to their number and the time employed, and, if a model is sent, the express charges upon this and the papers must be added. The total cost, in addition to Government fees, rarely exceeds \$40, and for this we do all we can without appealing the case.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients sufficient to make the experiment, and also of the manufactured article itself, must be furnished.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are considered more satisfactory to the Patent Office than the old and more cumbersome system of storing up an immense bulk of almost numberless models.

Drawings or sketches, sufficient to illustrate clearly the invention, with an efficient description to enable us to make a full set of perfect drawings for the Patent Office is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it for us.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or very poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention while in reality it may be of great value, and would meet with ready sale had the invention been fully portrayed by artistic and skillfully executed drawings. Again, when patents of this character are brought into court, the uncertainty and ambiguity of the drawings enable the opposing experts to mystify the judges as to the construction or combination of parts intended to be covered by the patents. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken that the invention is fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

In the Patent Office

The application is assigned to the Examiner having charge of the class to which the invention relates. The case must then take its turn with others in the order of filing, and in due time is carefully examined to test the novelty of the in-

vention. If the examiner fails to find anything that anticipates the invention, a patent is immediately allowed, provided the specification and claims are drafted in proper form. Should the Examiner find a prior patent which, in his opinion, anticipates one or more of the claims in the application, a letter of rejection is sent to the attorney in charge of the case; and, if the attorney coincides with the views of the Examiner, the claims rejected are erased. In preparing applications for patents, an attorney should be careful to familiarize himself with the class of inventions to which the application pertains, so that the specification and claims may be drafted as nearly perfect in the first instance as is possible. This course saves much time in prosecuting the application to a patent.

When claims are improperly rejected on patents which do not anticipate the spirit or wording of the claims, proper steps are immediately taken to convince the Examiner of his error. This is done, in most part, by personal arguments, as the differences in construction, operation, function and results are more readily discovered and appreciated by an oral presentation of the facts than can possibly be done by relying solely on written arguments. In order that the Patent Office record of the patents shall be complete, an oral argument is generally supplemented by a manuscript brief, that others, in examining the files at any future time, may clearly comprehend the position taken by the Examiner and attorney in prosecuting the case to a patent.

In addition to our own personal attention to the interest of our clients here, we have, for over 12 years past, had constantly in association with us in Washington, one of the soundest legal counselors and ablest practitioners in patent business in this country, who carefully attends in person to our business at the Patent Office, and has attained success in a most marked degree.

Perfect Claims.

The value and force of a patent are dependent on its claims. A patent may disclose to the public the most important and valuable invention, and yet the claim be of such meager scope that the patent is actually worthless. When the claims of a patent are so loosely drafted that infringers can flood the market with improvements, differing from the improvement disclosed by the patent only in slight changes in construction and arrangements of parts, such a patent is valueless to the owner, as it fails to afford him that exclusive and complete protection guaranteed by the Patent Law. Hence it is that the greatest care, skill and perseverance are required, first, in properly drafting the claims in the first instance, and second, in prosecuting the application before the Patent Office, and maintaining the rights of the inventor to claims as broad and sweeping as the invention will warrant. This latter is no easy task. The Examiners of the Patent Office serve in the capacity of attorneys guarding the interests of the public. It is their sworn duty to exercise the greatest care and watchfulness, that patents do not secure claims of greater scope than they are justly entitled to. It is but natural that Examiners are sometimes in error as to just what scope should be accorded an invention. Although the Examiners act under honest convictions in cases where they refuse an inventor his just rights, yet it is the duty of the attorney to maintain the claims of his client, if he is convinced that they are just and proper. To succeed in this requires the display of tact, firmness and shrewdness; and when the Examiner is made to see that the inventor is honestly and fairly entitled to the claims which have been rejected, he will almost invariably recede from his former action, and allow the case.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & CO. (continuously editors and publishers of the MINING AND SCIENTIFIC PRESS, nearly from its early commencement in 1860) offer comparatively far better facilities to the local inventors of the Pacific States and Territories than are possessed by any other agents in America. Members of the firm give personal attention to the applications entrusted to their care. They have been longer in practice in patent soliciting than most agents who are still personally engaged in the business. They have secured more U. S. and foreign patents in the past 20 years (with very few exceptions) than any other firm still existing. Their practice has been so successful and long continued, that the great majority of inventions on this side of the American continent have been patented through their agency, thus affording them great and valuable experience, by thorough information of the true principles and points of novelty in the inventions, whether general in character or peculiarly local to this coast.

The extensive business combination and experience of this firm is undoubtedly one of the most fortunate in existence for affording inventors prompt and reliable advice, and the best possible facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation that is best calculated to widely inform the class of readers most specially interested in the subject of his invention.

Saving of Time, Etc.

Inventors on this coast will find that owing to our familiarity with inventions and local affairs of this coast, we can more readily and fully comprehend their wants, and thus save much of the time ordinarily consumed in preliminary writing back and forth when distant agencies are employed.

Caveats.

A caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the inventor to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the inventor is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee is \$10 additional.

To enable us to prepare caveat papers, we only require a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves, or for them by other agents), who desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so.

.....SOLE MANUFACTURERS OF.....

KENDALL'S PATENT
QUARTZ MILLS.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are now enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past five years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that claimed for it and give entire satisfaction.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding homastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.
ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. IOHSE, SEC'Y.

Office, No. 230 California Street, - - - San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO, CAL.

Mining Summary.

(Continued from page 8.)

latter depth being within a few feet of the surface of the great flood of water, which has submerged the lowest levels for three or four years past.

ORISK.—On the 400 level the drift running south from the main west drift has been advanced 42 feet; total, 342 feet. The crosscut east from this main south drift is now in 117 feet, 24 having been added during the week. On the 700 level, the station at the main shaft is being put in thorough repair, with a view to running a drift in a northwesterly direction in Mexican and Union ground, for ore exploration purposes. On the 400 level the main south drift has been extended thirty-seven feet, making a total length of 298 feet. The crosscut west from this drift is in 135 feet, and the crosscut east is in about 100 feet. Nothing of value has as yet been developed on this level.

PINE CREEK.—Cor. Bedrock Democrat, Dec. 7: The Oregon Gold and Silver Mining Co., of Louisville, Ky., are working quite a force of men. I am told it is the intention to work twenty-five men on the Whitman mine this winter. The assessment work has been completed on all the principal mines for this year, and several of them have from five hundred to one thousand dollars' worth of work done. When spring opens, the capitalists can come in and see as fine a lot of mines as to be seen in the country. It has finally leaked out about these claims the Leap Bros. found some twenty-five miles from here in a northeast direction. I saw some of the ore that came from there last summer, but was misinformed where they got it. It is very rich and said to be extensive. There is no doubt that there will be a rush here in the spring. If we don't have a mining boom next summer, it won't be because the mineral is not here.

ALTA.—Explorations on the 700 level continue, and a drift is being run north toward the Benton ground. Some few bunches and streaks of good ore are met with, but no strong and extensive concentration. On the 700 level, the lateral drift north, toward the Benton ground, is making good progress in procuring vein material, with streaks and bunches of low-grade ore.

YELLOW JACKET.—Sufficient ore continues to be extracted to keep the Brunswick mill steadily running. This is all from the upper workings, above the 1300. Nothing new in the way of ore is developed by the exploring drift north on the 1700 level. About 175 tons continue to be the regular daily yield from the old workings, above the 1300 level, keeping the Brunswick mill steadily running. Nothing new in the way of ore developments yet discovered by the lateral drift north, being run on the 1700 level from the Crown Point mine through the Kentucky. Quite a heavy draft of miners was made the first of the present week, owing to the over-supply of ore and improved openings and facilities for extraction.

MEXICAN.—On the 500 level, the north lateral drift from the east crosscut has been advanced 37 feet, making a total length of 247 feet. No change in the material. The west crosscut has been extended 47 feet; total, 210 feet. On the 600 level the lateral drift, north from the east crosscut, is 210 ft., and the lateral drift south, opposite to it, 180 feet. Both are simply running in favorable vein matter. The west crosscut from the main north lateral drift is being extended and is now in 143 feet.

SIERRA NEVADA.—On the 500 level, the main north lateral drift has been advanced 50 feet, making a total length of 1356 feet. Face in the same favorable material as last week, soft vein porphyry, clay and quartz. The main north lateral drift has been extended during the week 72 feet, making a total length of 1306 feet. The material encountered continues to be soft vein porphyry, clay and quartz. Seven or eight tons per day of gold-bearing ore are taken from the surface croppings of the mine and shipped to mill.

UNION CONSOLIDATED.—On the 500 level the crosscut east, 100 feet south of the Sierra Nevada line has been advanced 36 feet; total, 401 feet. Material, vein porphyry, quartz and clay.

KENTUCKY.—The usual yield of ore comes from the old upper workings, sufficient to keep the mills running.

MONTE CRISTO.—A few tons of ore per day are extracted, enough to supply the mill.

BEST AND BELCHER.—On the 1000 level west crosscut No. 3 is in 336 feet. The diamond drill, which has been run ahead from the face of this crosscut, tapped quite a flow of water last Tuesday, and has been withdrawn.

Columbus District.

MOUNT DIABLO.—True fissure, Dec. 26: The winze from the east drift on the 4th level is down 135 feet. This is as low as the 5th level and we have stopped sinking the winze and started an intermediate drift on a small streak of 570 ore 64 feet below the 4th level. The east drift from the north crosscut on the 4th level is in 43 feet and the face shows 8 inches of 550 ore. The east intermediate from the No. 7 winze is in 161 feet and shows a small streak of ore in the face.

GREAT EASTERN.—J. H. Grafton arrived last Friday evening to take charge of the Great Eastern, formerly the Schiller. It is owned by W. H. Elliott, P. Manning and T. J. Harrington. Work will be resumed shortly.

O. K.—Two men are working on the incline following the ledge. They are down 13 feet. There are 8 inches of \$300 ore.

MOUNTAIN BOY.—Sinking the shaft. Now down about 90 feet. It is the intention to sink 10 feet further and then begin drifting. Have struck a few bunches of ore on the hanging.

Central District.

PROSPECTORS AT WORK.—Silver State, Dec. 23: S. W. Hammond was up from Central District yesterday. He says there are several prospectors at work in the district. M. S. Thompson has a fine body of ore at a depth of 275 feet in the Marietta mine. Charley Wright, Bob Calhoun and Charles Winn, are working on the Empire, a gold-bearing lead, recently discovered. They have sunk twenty feet on the vein, which looks well. J. F. Clark has shipped a carload of argentineous galena ore from the Locomotive to Salt Lake, and is prosecuting work on the mine. Mr. Clark is also making arrangements to resume work on the Railroad mine.

The low price of silver, Mr. Hammond says, is very discouraging to miners, and if silver coinage should be suspended and the price of bullion be further reduced they will have to quit.

Hawthorne District.

THE KINKADEE MILL.—Walker Lake Bulletin, Dec. 26: The Kinkadee mill is doing excellent work with its stamps and concentrator. It may be said that everything in the rock is saved and probably no tailings on the coast have as little assay value. Three men are now at work sinking the well deeper and running more drifts for an increase of water in preparation for the large quantities of ore which are now awaiting reduction. The stamps will probably have but few idle moments for a long time.

THE DICTATOR.—As work in the Dictator progresses the appearance of the mine improves, and it will not be at all surprising to those who have seen it, if it develops into one of the highest and best mines in this section. The ore in the ledge is getting better; a general sample which was sent to Carson for assay last week, gave very high returns, and as there is plenty of this kind of rock, the mills in this neighborhood will be kept busy.

THE RED BANK.—Work on the Red Bank will soon be begun. The ledge shows some of the richest rock in Hawthorne district, and everybody expects a great mine.

Lone Mountain District.

AN IMPORTANT SALE.—Elko Free Press, Dec. 18: The prospects of a lively mining camp at Lone Mountain next spring are very bright, an interest in the King mine of that place having been purchased by Mr. Edward Reilly, the extensive and successful mining operator, who is interested in mines in California, Arizona and other points on the Pacific coast, besides controlling operations in Bullion district, in this county the price paid for an interest in the King mine was \$10,000 in cash, and the putting up of a mill on Lone Mountain creek, the mill to be erected early in the coming spring. The sale is an important one in many ways, as it will be the means of putting new life into the Lone Mountain district, which has many other excellent mining properties. After closing the bargain with Mr. Weston, Mr. Reilly started for New York. On his return in the spring, work will at once be commenced on the King mine and mill. In Lone Mountain district there are many copper-silver mines which will be affected by the sale, as they will now be more extensively worked. We understand that parties are now looking into the matter of purchasing one or two of these copper-silver properties, and it is fair to presume that several others will be made next spring. The mill to be erected will be one of the new pattern for the reduction of free milling ores, and will be first-class in every particular. There is every prospect that Lone Mountain will come to the front in the near future. With a mill at Lone Mountain and reduction works at Elko, good times will come again.

ARIZONA.

IMPROVEMENTS.—Clifton Clarion, Dec. 23: The Arizona Copper Co. have decided to replace the old corrugated iron roof over the smelter with a new roof of slate. The sulphur from the furnaces formed an acid which destroyed the iron on the old roof. The pumps and blowers will be securely boxed up. The company are trying a new dust eater with much promise of success. The concentrating jig, with which experiments have been tried, has given satisfaction so far and it is probable that unless some untoward event occurs before long the jig will be introduced in a large scale on the works. A plunger with the proper length of stroke forces water up through a sieve. The ore containing copper, being of a greater specific gravity than the rock with no copper, falls to the bottom. The lighter portion is drained off in one sluice and the heavier (the copper) in another. By this process it is believed the output of the works can be doubled without serious increase of cost. The ore will pass through two crushers in succession and a series of revolving disks and will be received, according to its size, in probably six different concentrators. It would be impossible to pass through these works without being struck at once with the completeness of the plant and the nice and economic adaptation of means to specific ends.

COLORADO.

CRYSTAL CITY.—Elk Mt. Pilot, Dec. 26: The Black Queen is only working a small force of men for the winter, but the ore body is fully as good as it ever was, and will help to induce a smelting plant being erected on Rock Creek. The Belle of Titusville is showing up finely, and the boys expect to have considerable 100-oz. ore to ship next spring. They are making good progress and have a quantity of ore on the dump. George Hale is working the Good Enough on Sheep mountain, and is opening up a splendid body of galena ore. Cline and Turner will commence work upon the Hudson at once. They have a fine showing in the vein, and it is one of the properties that will come to the front. A sale of a 1/4 interest in the Tabor and Change claims upon White mountain, has recently been made, and they will be worked extensively next season, which will add to the attraction of that mountain. Traveling is good up Rock creek to Crystal and the boys of this section are all at work. The divide is closed for the winter, and we may say we are a world within ourselves for a short period, having laid in a stock of provisions for the winter. Development work goes steadily on among our mines and in our coal fields, which will bring out our camp as one of the best in the State. The Crown Point lode, on Covode mountain, owned by Hannigan and Santo, is a parallel vein to the Big Chief lode. The developments show one shaft which has been sunk to a depth of 25 feet. The crevice between the walls is about four feet thick. A vein of ore is apparent about two and a half inches in thickness, which shows yellow copper and green carbonates of copper, and assays 3-10 gold, 19 silver and 2 1/2 per cent copper to the ton.

IDAHO.

KETCHUM NOTES.—Keystone, Dec. 22: Billy Turner has struck ore above the Harris lode on Elkhorn Hill. The Philadelphia smelters closed temporarily a few days since, but will blow in again in a day or two. The managers of the Lion mine at Vienna put thirty men to work this week and have made arrangements to have their ore reduced by the

Vienna mill. The Wiswell mill on the Donovan group of mines has been running a week and proves to be a success. A partial cleanup was made after the first twenty-four hours' run, which was quite satisfactory. The Higginbottom claim at Muldoon recently shipped 1630 pounds of ore that went 991 ounces. A tunnel is being run to tip the ledge at a depth of 175 feet. The ore vein is small, but exceedingly high grade and the ledge and formation are good. The Minnie Moore mine at Bellevue is badly in debt and in the hands of the first mortgagees, who promise to square matters up. A beautiful body of gray copper and native silver ore was struck in the 1150-foot drift of the Ramsborn mine at Byhorse on the 11th instant, showing a continuous vein from the surface to that great depth. A fine specimen as large as a man's fist, and valued at several dollars, was received by Geo. M. Snow and is exhibited at the First National Bank. The Vienna mill is at present closed down, but will start up in a few days. A good strike—10 inches of ore—is reported in the Eagle Rock mine at Challis. The Wiswell mill at the Donovan group on Camas has started up and is said to run excellently. Six inches of fine galena ore is reported as having been struck in the Independence mine last week. There are about 200 men at work in Broadford and vicinity. About 80 men are at work on the Queen of the Hills. Idahoan continues to ship regularly. Bullion ships quite often. Deer Creek mines are shipping right along, and the mining outlook is quite encouraging for the winter. The famous Daisy Black mine, in the Blackburn district, is being patented, and early in the spring a full force of miners will be put on to develop. The Daisy shows an immense body of galena and carbonates, many thousands tons that will average about \$700 per ton. Thirty miners will be put to work on the Lion mine at Vienna next week. The mine is owned and worked by T. E. Cloherty & Co., of Ketchum. It is said to be in excellent condition.

THE MICA WONDER.—The "Mica Wonder" is the name of a mica mine lately discovered and now being worked in the Coeur d'Alene district. Of this wonderful mine the Coeur d'Alene Record says: "The vein is said to be between seven and ten feet thick between well-defined walls of shale and granite. The mineral lies in slanting veins separated by thin layers of soft spar. It is a continuation of the Denver, is of easy access, and can be easily and economically worked. The owners have already declined an offer of \$40,000 for the Mica Wonder, and have also bonded the General Grant for sixty days. It takes but a small cake of clear mica to be worth \$100, as the mineral now brings \$14 to \$22 per pound, according to the quality. The mica of the General Grant is more of a bronze color than that of the Mica Wonder. Mr. Horn expects to return to the mica region in a few days, and several men will soon begin the work of development.

WHEEL FOR SNAKE RIVER PLACERS.—Captain Story, ex-Special Agent of the Land Office, has, after months of experimenting, finally succeeded in perfecting a current wheel with which he expects to raise all the water needed to work his placer claim at Glenn's Ferry. The power supplied by a propeller wheel keeps in operation a centrifugal pump which will raise water to any height desired less than 50 feet. Captain Story says that at no place on his claim will he have to raise the water over 25 feet. The contrivance is called "Story's current wheel," and the inventor, who has applied for a patent, will leave to-morrow to make a practical working test of it.

THE BULLWHACKER.—Wood River Times, Dec. 23: This mine on Deer Creek is showing up well. The tunnel just completed shows ore through the 120 feet of its length. Deer Creek is rapidly coming to the front as an ore producer. We expect the output of ore from this camp will be quadrupled next year.

CHANGE OF MANAGEMENT.—It is stated on good authority that Peter Lane, Jr. is to be superintendent of the Philadelphia Smelting Co., after January 1, 1886. Mr. Lane is a live, energetic, capable man, and his appointment would be hailed with lively satisfaction by mine-owners generally.

NEW MEXICO.

ORE.—Silver City Enterprise, Dec. 14: Another carload of rich ore will be shipped to-day from the Old Man mine. From two to three cars of concentrates are shipped from Carlisle to Pueblo every week. Five different parties are now working and taking ore out of Chloride Flat mines. Some very high grade lots are reported. The Malone mines, at the camp of that name, are being worked regularly by the owners and with satisfactory result. Shipments are made at regular intervals. Six large silver bricks came in on Wednesday's coach, from the Minbres mill. They are worth about \$300 each. The mill runs out about \$1000 per day, which is not so bad. Two outfits—one four and one six-mule team—left here this week for Cook's peak, where they will engage in hauling ore for Johns and Doran to Florida station. Late reports from there say that the property worked by these parties is looking better every day. There are now about 70 tons of ore out and the present workings are all in ore. Preparations are being made for a steady shipping output. The concentrating mill of Shufelt & Co., will resume operations in a short time. It has been thought best to suspend temporarily, or until a supply of ore had been accumulated sufficient to guarantee the steady running of the works. Ore is coming in steadily and from what can be seen there is reason to anticipate an unbroken winter's run. The Rose Mining Company has come into a bonanza. It is as yet too soon to state the size of the pocket, but the ore already extracted may be classed as equal to anything ever taken out of Black Hawk camp. By the ton the ore will run over \$6000 and almost every piece is a cabinet specimen. This is good news for all miners and for the company it is particularly fortunate and opportune, as they will probably at once place a large pump and hoisting machinery on the mine and also purchase a saw mill for the purpose of supplying themselves with mine timbers. The parties now working the Young Man mine, at Malone, are meeting with good success. The work is being done in an open-cut 40 feet in length and from 15 to 18 feet deep. The ore streak shows at both ends and in the bottom for an average width of two feet. Much of it is a high grade chloride and sulphide of silver ore and it is taken down en masse and hand picked, the shipping class being of course the

select of all that is broken down and hoisted to the surface. The Flager works are running steadily on the low-grade mill tails which have constituted the metediferous supply of that establishment. Owing to the exceeding fineness of this material and the consequent difficulty of thoroughly saturating it with dissolving solution, as good progress has not been made as was anticipated. Much of it in fact is an impalpable powder and having lain out for years subject to the decomposing influences of the atmosphere, which have moistened and dried it over and over again until it has become almost like shale, it will be seen that the matter of handling it by a process involving the use of a chemical solution to take up the metallic contents is necessarily slower than it would be with freshly crushed ore. To obviate this and to facilitate the working of the mill to its full capacity, all haste has been made in the preparations to receive outside ore, and as this condition will shortly be reached better results may be looked for. Pulverized ore and the tail now worked will be mixed in suitable proportions and more expeditious work will ensue. About 80 tons are now treated daily whereas by the plan spoken of the amount treated daily will reach 115. The success of the Russell process is now gaining recognition throughout the mining centers of the country, and calls upon the discoverer's time are numerous.

OREGON.

PLACER AND QUARTZ.—Jacksonville Times, Dec. 26: Prospecting is still going on in nearly every portion of the county. H. G. Fitch is engaged in placer mining on Jackson creek and has a good supply of water. Prof. Cailey reports an abundance of water in the districts of Evans and Pleasant Creeks. W. J. Mills and Joe Epperson are at work on Thompson creek and have a good supply of water. The Sterling Mining Co.'s reservoir having been repaired, will soon be used to good advantage again. Gin Lin of Uniontown precinct received a new giant from California recently and is pipping day and night. Ten tons of ore from the Wagner creek quartz mines were shipped to Medford yesterday for reduction. J. N. Casteel was down from Big Applegate a few days since and reports all the miners of that section as busily engaged. All the miners, excepting those who depend on gulches and short streams for water, are able to do considerable work now. Money has been raised to purchase stamps for the Medford reduction works, and it is expected to have a capacity of ten tons every 24 hours. The miners of Josephine county are generally busy, and with few exceptions have considerable water. A good report may be expected from them this season. Wm. Patton, who lives on the road between Wagner creek and Ashland, is ground-slicing on his farm, having already taken out some gold there. Zach. Cameron of Uniontown was in town Monday and reported that the miners of that section all have more or less water, and some of them are quite busy. D. L. Green informs us that there is a prospect of work being resumed on the Yank ledge. J. W. Ingram of Willow Springs informs us that a great deal of prospecting is going on in that and Blackwell districts. The woods are full of prospectors everywhere in southern Oregon. We understand that a very rich strike has been made in the placer claims of Conner creek, Baker county. If the strike is as rich as reported, it is one of the richest ever made in Eastern Oregon. Messrs. Prickett, Finney, Caldwell, Price, Beckner, Bingham and other miners in the Steamboat district were here the forepart of the week, and report plenty of water and good prospects there.

OTHER MINES.—Because there are some excellent mines in the Pine Creek district is no reason why all other mines should be entirely passed by. As we have frequently informed our readers, there are as good mines in the Granite district as can be found on the coast. The Cabell Bros. mine is developing splendidly and the results from all assays made are encouraging in the extreme. Last week J. W. Virtue shipped nine sacks of ore from this mine to the Shelby Smelting Co., of San Francisco, and yesterday received returns of over 258 ounces of silver to the ton. The mines of Granite have not as yet obtained any great boom, and for that reason the prices asked for mining property are not as high as in other sections.

UTAH.

REVIEW.—Salt Lake Tribune, Dec. 25: The week has been one of warm, clear weather for the most part, the sun being even oppressively hot in the valleys. The movements of the metals have been light for the week. The shipments of bullion and ore out from this city for the week ending Saturday, Dec. 19th, inclusive, were 1,514,903 pounds. The receipts of bullion and ore in this city for the week ending Dec. 22d, inclusive, were \$65,128.53, of which \$52,359.29 was bullion and \$12,769.24 was ore. For the week previous the receipts were \$95,256.74 of bullion and \$25,271.30 of ore, a total of \$120,528.04. No reports from the Ontario this week, the mill being shut down. The bullion product stands at \$1,582,463.18 for the year, as per current reports, with 13 dividends of \$75,000 each, or \$975,000 in all. The Stormont sent up during the week two bars of silver \$2,900. The product of the Hanauer smelter for the week was eight cars of bullion, \$20,100; of the Germania, three cars, \$7,648.11. One car of Pascoe bullion came in from Stockton on the 18th. Two cars of bullion from Sprucemount, Nevada, \$3,100, are noted in the week's receipts. Alice bullion, 16 bars, \$16,661.18, was received during the week. Ore receipts were \$2,300 from the Sampson, \$2,400 from the Overland, \$1,853 miscellaneous, Utah; \$3,700 from the Queen of the Hills, \$1,300 miscellaneous, and \$950 Mayflower, Idaho; \$266.24 Davenport ore.

OTHER NOTES.—The Christy Company produced 19,000 ounces of silver last month. The Christy Co. is at present doing the assessment work on eight different unpatented claims in camp. Grant & Hall shipped sixty tons of fair grade ore from the old Leeds mine to the Christy mill last week. The roads to the Stormont mill are again in a good condition, and the regular quantity of ore is being crushed. The managers of the Butte attempted to bail out the water from the mine, but found that it will be necessary to put in a pump; enough water was taken out, however, to drain part of the old works, when the ore exposed made it evident that the property is a big bonanza worth going after,

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street,

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\$550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$109.15, or \$8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test, which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St.,

THE

"TRIUMPH" ORE CONCENTRATOR.

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

Old Mining Plates Bought, Replated, or Gold Separated. 3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.

E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Mexican Mines.

Mr. Frank A. Huntington, the well known manufacturer of quartz crushing machinery, has returned from a trip to Chihuahua, Mexico. In the course of a conversation with him, we have gained the following facts concerning the mines of that region:

The famous Santa Eulalia group of mines about seventy in number, all owned by the Santa Eulalia S. M. Co., are situated about twelve miles from the city of Chihuahua, and were first worked by the Spaniards about two hundred years ago. Their underground working consists of 16 miles of tunnels, and numerous large excavations, from which immense bodies of ore have been extracted. The Spaniards worked these ores by smelting, a portion being worked at the old town of Santa Eulalia, situated near the mines, and the balance they packed and smelted at the city of Chihuahua. The indications of their work are still plainly visible in the numerous large slag piles that one sees on all sides as he meanders around the outskirts of the quaint old town.

An idea of the immensity and great value of these mines can best be formed from the fact that in A. D. 1738 a church was built by the Padres, costing over \$800,000, from a tax of one and one half per cent on a dollar of their gross proceeds; and that all this vast wealth was extracted from surface workings, the deepest shafts being only 400 feet, or what California miners would consider only prospect shafts. The future possibilities of these mines can hardly be estimated if worked to a depth of 3000 feet. Traveling through these vast caverns one can hardly believe that they were once filled with solid bodies of ore and that all these immense chambers have been formed by the peons packing it to the surface on their backs, but history tells us that such is the fact.

The mill of the company now working the mines consists of twenty stamps and one five-foot Huntington centrifugal mill, ten amalgamating pans and five settlers. The company expect soon to erect three more Huntington mills and discontinue the use of their stamps, as this will increase the crushing capacity of their mill to 100 tons per day, and with less power than is now used to run twenty stamps. The mill is situated on the Mexican Central Railroad, two and a half miles from the city of Chihuahua. The ore is free milling (silver) and is worked by pan amalgamators in three hours without grinding. The ore is transported over the company's narrow gauge railroad, nine miles, to the mill.

IN THE HEART OF AFRICA.—Travels of Sir Samuel Baker, F. R. G. S. With map. 12mo., 236 pp., paper. Price, 25 cents.

"In all the literature of African travel, no single work can be found more exciting and also more instructive than this, in its disclosure of the mysteries of the Dark Continent."—*N. Y. Journal of Commerce*.

We will furnish (within 20 days at farthest) the above work, post-paid, at half price to new or old subscribers on paying for this paper up to one year in advance of this date. See our offer of desirable books on similar terms, inserted from time to time in this paper.

Doctors will find microscopes to suit, from \$500 at Muller's Optical Depot.

EXPLANATION.—CL for clear; Cy, cloudy; Fr, fair; Fy, foggy; — indicates too small to measure. Temperature wind and weather at 12 noon. (Pacific Standard time), with amount of rainfall in the preceding 24 hours.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco.

PAXATILA MINING CO.—Dec. 26. Location, Sinaloa, Mexico. Capital stock, \$60,000. Directors, D. L. Sheard, C. G. Bulton, H. F. Webster, D. Maclean, and C. Campbell.

WESTERN SHIPBUILDING AND NAVIGATION CO.—Dec. 27. Object, to construct and navigate steamers. Capital stock, \$3,000,000. Directors, Walter Forward, A. F. Anderson, H. C. Wilson, B. C. Duffy and N. Bauregard.

PACIFIC INDICATOR CO.—Dec. 27. Object, to manufacture and sell indicators. Capital stock, \$100,000, in 10,000 shares. Directors, M. M. Rhorer, N. W. Griswold, A. S. Rhour, J. T. Hanna, W. W. Brier, Jr., Edwin S. Irwin and F. Roland.

MERCHANTS AND CLERKS LAND ASSOCIATION.—Dec. 29. Capital stock, \$55,000. Directors, B. C. Hawes, Samuel Mosgrove, C. A. Boynton, A. O. Hazelhurst, Chas. McDougall, A. Goodchaux and Ezra Fowler.

CALIFORNIA PAYING CO.—Dec. 29. Capital stock, \$250,000, in shares of \$505 each. Directors, J. Shurer, Thos. Gamard, Wendell Easton, Chas. Warren, Theodore Reichart.

MEXICAN GOLD AND SILVER MINING CO.—Dec. 29. Location, Harris district, Douglas Island, Alaska. Capital stock, \$10,000,000. Directors, J. D. Fry, James Freeborn, T. J. Hay, James Treadwell and C. F. Stone.

ADMIRALTY GOLD AND SILVER MINING CO.—Dec. 29. Location, Harris district, Douglas Island, Alaska. Capital stock, \$10,000,000. Directors, J. D. Fry, James Freeborn, T. J. Hay, James Treadwell and C. F. Stone.

Mining Share Market.

The resumption of deep sinking the combination shaft of the Chollar, Norcross and Savage Mining Companies—sinking for the 3200 level, 100 feet deeper than heretofore attained, and also the proposed resumption of work at the Osbiston shaft, which is to be pumped out and sunk to a corresponding depth with the Combination shaft, the two to operate together in the drainage and development of the middle mines has given a better outlook to mining affairs on the Comstock. Operators in the market here are more hopeful now that deeper workings are again to be commenced. These two new movements in the mining management, combined, form a very interesting and promising feature in the deep level development, and if as effectually carried out as they promise to be, they cannot fail to have a great influence in the possible resumption of deep workings throughout the middle and northern sections of the great Comstock lode.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we offer the following advantages to all new subscribers who pay one year in advance, or present subscribers who will pay their subscriptions up to a date fully one year in advance of the present time. We will furnish the following articles (while this notice continues), at the reduced rates named, viz.:

- 2.—World's Cyclopaedia, 704 pages, with 1,200 illustrations, worth \$1.75. Postpaid for 50 cts.
- 3.—Patent Binder (cloth cover) with name of this paper in gilt. Postpaid for 50 cts. \$1.00
- 6.—To New Subscribers, 12 select back Nos. of the MINING AND SCIENTIFIC PRESS. Free .75
- 7.—Any of Harper's first class periodicals, 15 per cent less than regular rates.
- 8.—Frank Leslie's and most other U. S. periodicals, 15 per cent discount from regular rates.
- 9.—Pacific Coast and Eastern Bibles, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent less than advertised retail rates.
- 10.—Picturesque Arizona, 350 pages, in cloth and gilt. Postpaid for 25 cts. 1.25
- 11.—California, 100 pag. e, Magazine, 1880 to 1885 (5 Vols.) single Nos. Postpaid for 3 cts. .35 For volume, unbound, 5 Vols., Postpaid for 20 cts. 2.00 For volume, bound, cloth, back and stiff paper sides. Postpaid for 40 cts. 2.50
- 13.—Picturesque California Houses (40 building plans and estimates). Postpaid for \$1 3.50
- 14.—Dewey's Patent Newspaper File Hold. (or 18 to 36 inch). 25 cts. .50
- 15.—Life among the Apaches, 322 pages, stiff cloth. Postpaid for 25 cts. 1.00

NOTE.—The cash must accompany all orders. If too much is sent for any article or publication, the balance will be returned immediately. Address this office, No. 252 Market St., S. F.

P. S.—No. 11 is really a valuable premium to newcomers and others who appreciate the better class of stories and a good standard of California literature. Webster's Dictionary, 634 pages, with 1,500 illustrations. 50 cts. 1.50

Grant Lithograph, size 2x19 50 cts. .50

Cleveland Fine Steel Plate, size 12x16. 10 cts. .50

Grant Steel Plate, cabinet size, 6 cts. .25

Do Groot's History of Mining in California. 6 cts. .25

Beautiful Poetic Review, a handsome, entertaining and instructive souvenir of real merit 25 cts. .50

Send for any further information desired.

Readers will please inform their new neighbors and others concerning our paper and these offerings. On application, sample copies of this paper will be mailed free to the address of any persons thought likely to subscribe.

Please Remit.

We would call the attention of patrons who have not yet remitted their subscriptions for 1886, to the "List of Inducements" at present offered in our columns, and urge all who can to remit to us at this time. We are not only in need of that which is due to date, in making settlements, but can use to great advantage remittances for the next year, in making improvements and better arrangements for the future. Those who do not wish to select their premiums at the time of making payment, will, if they so request, receive certificates whereby they can order premiums at any time within six months.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

- JARRO C. HOAG—California.
- J. J. BARTLE—Amador and Calaveras Co's.
- F. H. HOAN—Nevada (State).
- G. W. DOUGLAS—Arizona.
- E. L. RICHARDS—San Diego Co.
- R. G. HENSON—Idaho and Montana.
- GEO. McDOWELL—Santa Clara and Santa Cruz Co's.
- HENRI ELIAS—Nevada Co.
- J. WINKLER, Alameda Co.
- M. L. DENNIS, Yuba and Nevada Co's.
- J. B. PATCH, Nevada and Utah.
- L. D. CLARK, Tehama and Shasta Co's.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

A Golden Opportunity in Montana

THE CELEBRATED Woodbury Oils.

Pure, Perfect, Uniform!

THE WOODBURY OILS are in use on the Central and Southern Pacific Railway, and on nearly every railroad and steamship line on the coast.

We are not agents for other manufacturers, but have our own works, and adapt here all our oils to the requirements of home machinery and our climate. We can show recommendations and records of tests, showing a saving to our customers of 50 per cent on their lubrication last year. Address

CHARLES J. WOODBURY, 123 California St., San Francisco.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The underigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

RANKIN, BRAYTON & CO.,
BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 600 feet of five-eighths steel rope. SEND FOR CIRCULAR.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a part of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

Manufacturers of

MINING MACHINERY, ENGINES, BOILERS, Etc.

We are manufacturing from Special Designs of the most experienced and successful Practical and Scientific Experts, Complete
Plants for all descriptions of Mining Operations, as follows:

CONCENTRATING MACHINERY—Best and Cheapest, Cornish Rolls, all Steel Wearing
Parts, Most Practical Styles of Two, Three and Four Compartment Double and Single Jigs, Siz-
ing Screens, Patent Hydraulic Separators, Tahles and Concentrators.

STAMP MILLS for Reduction of Gold and Silver Ores, whether free milling or base. Most
useful and substantial styles of Single and Double Discharge Mortars, Wet or Dry Crushing.

STEEL SHOES AND DIES, Tappets and Cams, cheapest and best Blake Improved Rock
Crushers and Automatic Ore Feeders, Superior Amalgamating Pans with wood or iron sides.

PANS FOR TREATING GOLD ONLY, Settlers, Clean-Up Pans, Retorts, Furnaces,
Dump Cars, Hoisting Machinery, Cages, Landing Dogs, etc.

CORLISS, MEYER'S CUT-OFF AND BALL'S PATENT VALVE Engines of extra
strength and durability.

STEEL BOILERS of Two Sheets only, Steel Economic Boilers, combining with the safety,
durability and economy of the Stationary Boiler, the convenience and portability of the Portable.
It occupies but little space, and is the best and cheapest boiler ever made.

WE ALSO MANUFACTURE SAW MILL MACHINERY.

We are also Sole Agents for the Gordon and Maxwell Steam Pumping Machinery, and carry
a full stock of all kinds of Mill Supplies, including the

Albany Lubricating Compound and Oils.

MINING AND SCIENTIFIC PRESS.

VOLUME LII
Number 2.

An Automatic Steam Trap.

A steam trap is intended to remove or separate the condensed water from steam. The engravings on this page illustrate the Watson & Gankroger self-regulating automatic steam trap, recently patented, and manufactured in this city by W. T. Garratt & Co., 138 and 142 Fremont street. *A* is the trap body; *B*, hollow float; *C*, suspension valve; *D*, brass ribbon; *E*, clamping nuts; *F*, counter-balance lever; *G*, counter-balance weight; *H*, discharge valve; *I*, connecting lever; *K*, float suspension links; *L*, cup; *N*, stop; *V*, inlet opening; *P*, outlet opening; *S*, glass water-gauge.

The manufacturers claim the following advantages for this device: The discharge valve is a balanced double-seated poppet valve, placed in a vertical position, the area of the valve being in excess of the area of the inlet pipe, thus absolutely preventing the trap from becoming water-logged, as the water leaves the trap as rapidly as it can possibly enter it; this is a feature peculiar to this steam trap. The seats of the valve and the valve itself are washed every time the valve opens, and the valve being in a vertical position, no sediment can be retained on either the seats or valve, and the valve closes absolutely tight after each discharge. The float is a cast iron basin, open at the top; being larger at the surface than at the bottom, rendering it impossible to crack or collapse by frost or other means. Each steam trap is provided with a glass water-gauge, enabling the operation of the trap to be observed at a glance.

The connections between the float and counterbalance lever are purposely made of small brass wire and a flexible brass ribbon to overcome friction. No stuffing box is required; but to guard against the possibility of leakage in case of extreme steam pressure or defective fit of float steam, a gland nut is provided. In experience of several hundred of these traps the manufacturers have found packing around the stem entirely unnecessary. This steam trap will work equally as well with one pound steam pressure as with one hundred; no modification is necessary to meet varying pressures. To put the trap together the following directions are given: Set the trap level; make proper connections to inlet and outlet openings; insert suspension wire *C* to the bottom of hole in clamping nut on top of float, and firmly secure it with the clamping nut *F*. Place counter-balance lever *E* on its pivots and insert brass ribbon *D* to the bottom of slit in the upper part of clamp and secure it firmly with the clamping nut. Fill *B*, hollow float, with water, securely bolt on the cover of the trap, place water gauge in position and properly pack same. Turn on the steam and adjust counterbalance weight, *G*, so that the float will rise when water shows in the gauge glass to within about two inches from the top of the glass; secure the counter weight by the set screw; after this no further attention is needed.

The great strike of the Monongahela coal miners is over, the men having gone to work again. It is estimated that over \$1,500,000 has been lost by the strike.

Killing Marine Insects.

In many seaports, and especially on this coast, certain marine insects, notably the teredo and limnoria, are very destructive to wooden piles which have been driven for wharves and landings, and by incessant boring they soon honeycomb the wood so that it is entirely destroyed and the piles must be replaced by new ones. Many plans of poisoning the wood, etc., have been tried to prevent this. Mr. John Dolbeer, the well-known saw-mill owner, of

the tube may be unclamped and removed to another, and the treatment be repeated. In some cases it may be found desirable to introduce a poisonous substance, which will be sufficiently powerful to destroy animal life; but Mr. Dolbeer states that he has found the high temperature applied in the manner described as usually sufficient for the purpose.

THE Tucson *Star's* annual review of Arizona gives the following summary: Population, 65,000; value of real and personal property,

WATSON & GANKROGER'S SELF-REGULATING AUTOMATIC STEAM TRAP.

this city, has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency an apparatus to prevent the ravages of the worms, which is quite original. The piles may, by this, be treated after they have been driven, and where they are partially submerged and exposed to the attacks of the marine insects. It consists of an inclosing case made sepa-

\$98,000; head of live stock, 500,000; grain product, 74,600,000 pounds; gold dust and bullion, \$282,614; silver bullion, \$2,671,400; ore shipments, \$1,831,500; copper produced, 24,360,000 pounds.

THE Coos Bay *News* reports another failure in the matter of attempting to separate the

Measuring Globules of Silver.

As the amount of lead which can, in blowpipe assaying, be conveniently cupelled before the blowpipe is necessarily limited, the silver globule which remains on the bone-ash surface of the cupel at the end of the operation is, when substances poor in silver have been examined, frequently so very minute that its weight cannot be determined by the most delicate balances in general use. Blowpipe balances will turn with one-thousandth of a grain, but on determining weights below that are not accurate. Globules of silver of far less weight than one thousandth are distinctly visible to the naked eye—a circumstance which induced Harkort to invent a volumetrical scale based upon the measurement of the diameters of the globules, which scale in practice has been found of great utility in the blowpipe assay of silver.

The scale for this purpose which is employed by Mr. Geo. Attwood, author of "Practical Blowpipe Assaying," is shown in full size in the accompanying wood-cut.

This figure represents a small strip of highly polished ivory about six and one-half inches long, two-thirds inch broad, and one-eighth inch in thickness, on which are drawn by an extremely fine point, two very fine and distinct lines, emanating from the lower or zero point, and diverging upward until, at the distance of exactly six English standard inches, they are precisely four-hundredth parts of an inch apart. This distance (six inches) is, as shown in the wood cut divided into 100 equal parts by even lines numbered in accordance from zero upwards.

It is now evident if a small globule of silver be placed in the space between these two lines, using a magnifying glass to assist the eye, or moving it up or down until the diameter or globule is exactly contained within the lines themselves, that we have at once a means of estimating the diameter of the globule itself, and therefrom are enabled to calculate its weight.

The flattening of the globules makes it difficult to calculate directly from their diameters as spheres, but require to have their actual weight experimentally determined in the same manner as employed by Plattner.

A table of weights to accompany this scale is given in Mr. Attwood's book. The weights are calculated from the following data, found as the average result of several very careful assays, which showed that globules of silver exactly corresponding to No. 95 of this scale, or 0.038 inch in diameter, possessed a weight of 0.0475573 grains or 0.003079 grain. From this the respective weights of all other numbers or degrees on this scale were calculated, on the principle that solids were to one another in the ratio of the cubes of their diameters. This is not exactly correct on account of the flattening of the under surface of the globule, but the difference is small.

DEMANDS have been made upon the authorities at the Carson mint by the attorney for the Citizens' Committee to receive and coin bullion, which were refused. The object was to obtain a foundation for a suit to compel the Government to obey the law concerning the mints.

SCALE FOR MEASURING SILVER GLOBULES FROM BLOWPIPE ASSAYS.

able so that it may be applied to a pile or portion and closed around it, and a means for injecting into the interior space, thus enclosed, steam or any other substance. He does not propose to try to prepare the wood before it is put to use, but to kill the worms when they get into said wood. The enclosure for the pile is formed of two semi-cylinders hinged together at one edge, and surrounding the pile or structure. Pipes are provided for introducing a current of steam or other destructive material into the inclosure and between the sides of the same and the pile. Peculiar wedges or keys are used for locking the semi-cylinders together, and they are so arranged as to be locked or unlocked from above the surface of the water. The steam from the steam pipes heats the water, which is inclosed within the tube around the pile, to a temperature depending on the amount of steam admitted. This process is carried on long enough to destroy all animal life within the pile, when

gold from the black sand of the ocean beaches. Pugh & Co. are the parties who have come to grief this time. The man who can succeed in inventing a sure process for saving the fine gold of the beach will aid materially in increasing the circulating medium on this coast and elsewhere.

THERE is not a claim in Pioche that has secured U. S. patent. Owing to the jumping and rascality resorted to, to obtain possession of mining ground in this district, up to within the last 10 years, it would have been impossible to obtain patent from the Government. The Pioche *Record* properly says: "The United States land offices do not issue patents to mining claims, the title to which the owners secured by hiring armed desperadoes to go to take possession of and drive off the rightful owners, as soon as it showed to be of any value."

A REVIVAL of mining in San Antonio district, Nevada, is among the probabilities of the year.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—E.D.

Montana Mines.

[By R. G. HURON.]

Continuing our description of the mines from last week, I may mention that the Banner mine, owned by F. J. Lowry and others, of Helena, is now under a working bond and is thought to be a good property. The Belle of Bellvue, owned by Dr. Brooke, of Helena, is near by, and has been developed to a considerable extent.

The Minnesota has also been worked to a considerable extent, and some money has been made, but is now lying dormant, for what reason I could not learn. Whilst at Gregory I learned of some

Discoveries Being Made

Up in Basin gulch, near the head, and was shown some very fine looking ore from them, but they were not sufficiently developed to know to any certainty as to permanency. It ought to be good. I will say that much, for it was being developed by a man and his wife, she making a hand on the windlass. I, for one, wish them full success.

On the mountain, half way between Gregory and Wickes, is two locations, and very good ore in large quantities has been taken from each of them. They are called the North Pacific and the North Atlantic. The former is owned by the Reduction Company, of Wickes. They are each working a small force of men prospecting. The ore in each of these mines seems to lie in bunches, with no particular wall or anything else to guide to another bunch when it gives out.

From Wickes to Elkhorn it is 30 miles straggling on a pretty rough road, and it was dark when I arrived there. It is a primitive mining camp and no mistake. I would advise a stranger, without he is a good rustler, to take his blankets with him, as hotel accommodations are scarce. The mine is a good one, without a doubt, as it is a close corporation, and no interest for sale, which is good evidence of what I say. It is owned in five interests by A. M. and M. M. Holter, John Kinna, John Shober and Neil Vawter. The mine is operated through an incline, is down about 600 feet, and this ledge averages about 6 feet in width. They have some ore that does not require roasting, but most of it does. They are supplied with one of the Howell improved continuous feed and discharge furnaces, and they are well satisfied with its operations. Their bullion contains quite a percentage of gold, and whilst their ledge is not extremely large, they have no difficulty in keeping their plant running. The mine is ably superintended by an old-timer of Nevada and California, named Kilhoun, who thoroughly understands his business.

The J. R. Keene lode, an extension of the A. M. Holter mine, is owned by S. T. Nicholson and E. M. Jamison, who have a shaft down 90 feet, and from a sample three-ton lot milled netted them \$207—a pretty good return. They feel confident that their property is as good as the one the Elkhorn Company are working on. The good luck is certainly deserved, as Mr. Nicholson has remained in this camp at times when everybody deserted it, and has been there continuously for seven years.

On my way down to Boulder next day we were treated to a genuine upset of the stage coach, but as nobody was seriously hurt we picked ourselves up and turned the old coach over and traveled on. A member of the house of Israel, riding on the seat with the driver, was unfortunate enough to measure swords with a boulder in the fall and his nose came off second best, but he was mollified by receiving a free pass to Wickes, and went on his way rejoicing. After we all had a good warm dinner with mine host, Trotter, of the Boulder Valley hotel, were in comparatively good spirits all around.

Boulder Valley is the County Seat

Of Jefferson county, and to all appearances is a prosperous, enterprising burg. Their close proximity to mining districts will tell to their advantage. The Amazon mine and works are within three miles of town. Just at the time of my visit, the mine and works were shut down for a short time and I did not make a visit in form, but I understood from a party who was interested that it would remain so only for a short time. From Boulder I went by Gilmer & Saliebury line of stages to Butte, a distance of 36 miles, a good road leading up Boulder creek and then over one of those parks that frequently open out in these high altitudes, and before I arrived at Butte I had a chance to find how cold a man can get and yet not freeze. On looking around Butte for a day or two, I concluded to postpone going over the town in the interest of the PRESS until after pay day, and went from there to Anaconda, 22 miles, by rail.

The Cable Mine.

Thence I went to Cahle and Phillipsburg, a distance of 35 miles, in a northwesterly direction from Butte. The Cahle divide is a very high one, and cold in proportion. The Cahle mine is one of the oldest mines in the territory, machinery having been erected there 18 years ago, and some of the richest gold ore ever taken

out in the country has come out of this claim. They have pounded out in a quicksilver tank as high as \$1000 per day. It is now owned by two gentlemen of Des Moines, Iowa, named Hubbard & Savery, and is managed by Mr. Savery. They own many other properties around here, and virtually run the town of Cahle. The 30-stamp mill, finely appointed with Ingersoll Air Compressor, capacity for five drills, general store, boarding house, and in fact everything, is under their management. Three miles southwest from Cahle is the

Silver Lake Mining District.

Where there are a number of locations and considerable work has been done. Mr. John Sloss, amalgamator for the Cahle Co., has a property there which he thinks will prove a good one; at present he has it leased to some parties who are now at work on it, and are getting out some fair silver ore. Two miles to the north on the Phillipsburg road, is the town of Georgetown, where years ago some placer mining was carried on, but is now the location of the Pyrenes mine, a gold bearing lode, and owned by S. Cameron, R. H. Kelley and Mrs. J. A. Moss. The width of lode runs from two feet to eight feet, and pays from \$10 to \$20 per ton, the average running from \$15 to \$18. They are now working from a tunnel, striking the lead in some 30 feet; are working a small force and running a five-stamp mill. They have a contract to sell to a Glasgow Co., and from the fact that the company went to work and put in a large amount of cordwood and other supplies, and paid for them, it looks as if they meant business, and if they do take it there is no doubt that they will increase the working facilities as there is a large percentage lost in working the way they are now.

Half a mile further down is a mine called the Ontario, owned by Messrs. George Kidder and Dr. Merrill. This mine, while it is not developed to any great extent, has produced some very fine ore. A shipment made to Anaconda a short time before I was there returned over 400 oz. silver per ton. This was selected ore, of course, but it only seems natural to think that there is plenty more there, which, if not as good, is yet good enough to stay by. Mr. Kidder and I having mined on the same gulch eighteen years ago, I was very glad to find him with so fine a prospect. These mines are in such high altitude that in order to do work to any advantage have to be well prepared for winter.

Phillipsburg

Lies some 16 miles north of the Cahle, and is on a tributary of Flint creek. This town was started about the same time the Cahle mine was discovered; the mine on which its first hopes were based was the Hope. It is still being operated and is one of the main stays of the camp. It is operated by a St. Louis company; Charles Tausig, President; John C. Porter, Vice-President; Louis Duestrow, Treasurer; Charles A. Cuno, Secretary. The mill of this company is at the present shut down and they are sinking a shaft to work a new ore chute discovered by the use of the diamond drill, their ore bodies being different from any other mine in this part of the country, lying flat as it were, and do not confine themselves within two wallrocks. But this seems to be one of the mines that the diamond drill is peculiarly fitted for prospecting. Through the kindness of Mr. Bahcock, the efficient superintendent, I was able to learn the cost of the diamond drill prospecting. The operating in the Hope mine cost the company \$1.86 per foot; this, through hard ore and manganese, makes it a cheap mode of prospecting. The assays from the cores of the drill in this new ore chute are very much higher than the company have been working on for some years past, consequently the Hope Company feel that they have an era of prosperity ahead of them that will make up for all their efforts in the past. The company have a finely appointed mill, and consequently gave a high percentage of the assay value. Some of the machinery is of the old pattern, but withal is capable of doing very satisfactory work. On the new shaft is a steam hoist, which will be a vast improvement over the old whim in speed and economy in every way. The shaft will be nearly 300 feet deep, and they expect to strike the ore body by the first of the year, when they will put on a full force and will materially assist the prosperity of Phillipsburg. There is another mill property a short distance above the Hope, called the Northwest, but it is idle, and has been for a long time. In a gulch south of Phillipsburg is another mill property, called the Algonquin, one of the finest appointed mills in Montana. It is also shut down at present, owing to the burning of the hoisting works on the Trout mine some time ago. The Mill Company also own some properties near by, but are in litigation about them and there is no telling when they will get a going. There is quite a number of mines leased here and select their ores and ship to Helena and Wickes for reduction. If it pays to do that, it would certainly pay in town to work it if they are as well provided with machinery and works at the Algonquin as I have been informed.

THE Bird's Eye Creek mine in this State, owned by an English company, has paid a dividend of \$7500, the second of the same amount for 1885.

A CHINAMAN, at Poverty Hill, while cleaning out an old tunnel, was killed by a cave last week.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

NEWSPAPER FILE.—Frank M. Niques, Arcata, Humboldt Co., Cal. No. 332,769. Dated Dec. 22, 1885. This new paper file is arranged so as to be adjustable for large or small papers or periodicals.

REMEDY FOR BLACKLEG.—Chas. L. Hussey, Sacramento. No. 332,804. This is a medical compound, the object of which is to prevent that disease of cattle known as blackleg. There are several ingredients used.

HOUSE-RAISING APPARATUS.—Thomas F. Mather, S. F. No. 332,811. Dated December 22, 1885. This house raising apparatus consists in peculiarly constructed adjustable frames and nuts, adapted to be fitted to their places and the work continued without having to remove the lifting screw during the whole operation. The object of the invention is to provide means for completing the full operation of raising or lowering a house without having to remove the lifting screws.

BARK CUTTER.—John C. Hagerty, Santa Cruz. No. 332,796. Dated Dec. 22, 1885. This invention relates to a machine for cutting bark and preparing it for tanners' use. In this machine there is an arrangement by which any desired number of feed openings may be employed and the bark introduced at different points around the circumference so that the cutters will be constantly at work and a larger amount of bark can be prepared than where there is a single feed opening.

BARK MILL.—Wm. A. Woods, Santa Cruz, assignor to John C. Hagerty. No. 332,854. Dated Dec. 22, 1885. This bark mill consists of a drum rotating within an outer casing and having hollow, cylindrical chambers with closed ends formed at intervals around its periphery. These chambers have curved knives or cutters fitted in them so that their edges project just beyond the periphery of the drum, and the bark being fed into an apron or chute in the case, which delivers it so that it rests against the periphery of the drum, these cutters will clear it off, so that it is discharged through the opening in the lowest point of the case.

GRAIN SEPARATOR.—R. M. Cochran, Jacinto, Colusa Co. No. 332,786. Dated Dec. 22, 1885. This is a machine for separating grain from the straw and chaff after it has been thrashed. It comprises a main carrying-helt and straw-carrier, beaters and pickers and cleaning shoe, an open inclined traveling belt moving over partial floors or bottoms, the lower floor being slotted to allow the grain to fall through a partially covered rack beneath said slot upon which the grain and unthrashed heads are received, a cleaning shoe situated beneath said rack, and fans and conveyors for grain and unthrashed heads.

DIE-STOCK.—Joseph H. Hines, Calistoga, Napa Co. No. 332,801. Dated December 22, 1885. The device is intended for cutting screws. It consists of dies with an inclosing head or case, having ratchet-teeth upon its exterior periphery; a chambered stock, within which the ratchet is fitted, and a means for retaining it therein; handles extending on opposite sides of this stock, and provided with spring-pawls, which engage the ratchet head upon opposite sides, and a sliding key or lock by which the ratchet head is prevented from revolving at will.

AUTOMATIC FANNING MILL.—Harry S. Zink, Sacramento, assignor of two-thirds to Richard Reed and H. S. Ruhlman. No. 332,470. Dated Dec. 15, 1885. This fanning mill comprises a power wheel adapted to be rotated by the grain itself as it passes from a superposed hopper; a directing chute, riddle and fan, said fan and riddle being connected with and operated by the power wheel, and an agitator or feeder within the hopper, also connected with and operated by the power wheel, whereby the grain is fed constantly and evenly. The object of the invention is to provide a fanning mill, which is adapted to be operated automatically by the weight of the grain in the hopper, and to continue its operation as long as the hopper is supplied.

OYSTER OPENING DEVICE.—C. Leduc, Denver, Col. No. 332,403. Dated Dec. 15, 1885. The invention relates to that class of oyster-opening machines, in which the oyster is held in a suitable bed or clamp, and is opened by the insertion of a knife or blade upon a pivoted lever; and the invention consists in a peculiar pivoted and jointed lever carrying the knife or blade, which is thereby adapted to be moved through an arc on a vertical plane to penetrate between the valves of the oyster shell, and to be turned at right angles to the plane of its first movement, whereby it is enabled to pry the shell open. It consists, further, in sharpening the edges of the knife or blade, for the purpose of severing it from its shell, and in a peculiar adjustable bed, in which the oyster is held, while its shell is being opened.

FEED WATER-HEATERS.—Lars. A. Olen, S. F., No. 332,824. Dated Dec. 22, 1885. This device for heating and purifying feed water to boilers consists of a boiler iron box at the rear

of the boiler, a second box or casing upon the first box, and containing return flues communicating with the pipe from the pump, said box or casing receiving the exhaust steam; a globe connected with one end of the first box and with a pipe from the flues of the second box, a globe connected with the other end of the first box, and with the pipe to the boiler; a cup or disk in the first globe to receive the feed water, and a valve outlet from said cup, a check-valve in the second globe, a perforated casing around said valve, and a screen cylinder around the casing, a discharge pipe from the globe, and other details of construction. The object is to provide a device adapted not only to heat the feed water, but at the same time to purify it, and which can easily be cleaned.

CAR TRUCK.—Wm. T. Brown, Stockton. No. 332,378. Dated Dec. 15, 1885. This consists in a main truck-frame centrally supported upon a pair of wheels, supplemental truck-frames upon its same level, each supported upon a pair of wheels on a central longitudinal line, equalizing bars extending along each side of the main truck-frame, having their proximate ends supported upon the boxes of the central pair of wheels and their outer end suspended by links in line directly above the axles of the supplemental truck wheels. The springs by which the truck frame is supported rests upon the equalizing bars at points in their length between their supporting end. The invention further consists in a means for suspending the outer ends of the equalizing bars so that they will act to allow the supplemental trucks to adjust themselves to the curves in the line of the road and to return to their normal position whenever such curves have been passed.

BARK-CUTTER.—John C. Hagerty, Santa Cruz. No. 332,797. Dated Dec. 22, 1885. The machine consists of a cylindrical drum rotating within a casing, which is provided with a chute or hopper, through which the bark is brought in contact with the periphery or face of the drum. Through the face of the drum slots are made, which communicate with chambers in its interior, these chambers having straight sides nearest the periphery of the drum to receive straight-bladed cutting knives, and are enlarged or curved at their rear inner portions, and which are at the same time inclined and spread or flared to open outwardly toward the end of the cylinder, so that the bark, which is cut off by the knives, as the cylinder rotates, will pass into the chambers and be thrown outwardly from them by the inclination and flare or funnel-shape of their inner rear portions. The bark will be discharged into the space between the side of the drum and the surrounding casing without being allowed to pass into the interior of the drum or around the shaft.

ELECTRICAL THERAPEUTICAL BELT.—Chas. N. West, S. F., No. 332,467. Dated Dec. 15, 1885. The invention has reference to electrical belts for therapeutical belts. It also relates to certain improvements in appendages for connecting the belts with certain parts and organs of the human body, by which the electric current is conducted from the belt and applied to those parts and organs. The first improvement applies to the construction and peculiar arrangement of the parts of the individual elements of the belt, by which these elements may be taken apart at pleasure and any of the parts exposed, so that they may be cleaned or renewed without breaking the electrical connection between these elements or in any manner require the reconstruction of any portion of the battery, or elements in the series constituting the belt; and it further relates to the manner of linking or connecting the elements together. The second improvement relates to the form and arrangement of the conductor for applying the electric current the organs of the body.

Winifred District, Arizona.

A few weeks since one of our correspondents mentioned that in one of California districts had been found the purest gold that had been found in quartz. W. L. Hastings, of Phoenix, Arizona, writes us, in reference to this statement, that he has in Winifred district, Arizona, taken out quartz that yields very pure gold, and sends us as evidence, the certificate of assay, by J. G. Trotter, of the assay office of the St. Louis and Yavapai M. & M. Co. The ore from the Lawrence mine, assayed by him, yielded at the rate of 5.712 ounces gold and .24 ounces of silver per ton. The value of the gold at \$20.67 per ounce, was \$118.07, and silver, at \$1 per ounce, .24; total, \$118.31. This shows the gold to be remarkably fine.

The ledge is not very large, being only 18 inches wide, and assays from \$76 per ton upward. The best mine in the district is the Union. It is considered a true fissure vein, is one and one half to four and one-half feet wide between the walls, and is all pay ore, as are the other ledges in the district. The ore works \$32 per ton. The formation is granite foot wall and slate hanging wall. The district is about four miles long and one mile wide. Our correspondent concludes, "I think the MINING AND SCIENTIFIC PRESS is a necessity to any miner, and I am always glad to get it. I show it to all my acquaintances and try to get them to subscribe."

A LIDA VALLEY correspondent says that the State Line mill is running steadily on ore.

MECHANICAL PROGRESS.

Mysterious Failures of Steel Plates.

A correspondent of the *Engineer* writes to that journal as follows:—The eccentricities of steel plates are again exciting the apprehensions of ship owners and shipbuilders in the North. A certain steel ship is at present under construction at a northeast coast shipyard. The plates are supplied by a company which have every appliance for making them well, and, as a matter of fact, they are all subjected to Lloyd's survey before leaving maker's works. The garboard, or keel strake, was duly bent, punched, countersunk, and, last of all, annealed in the usual manner, and then riveted to the ship frames. By the time the work was so far complete, however, three of the plates cracked in a mysterious manner, and became, of course, quite useless. After being cut strips were taken from the cracked parts of the cracked plates, and were tested in every conceivable way. It was thought that brittleness or inferiority of some kind would be detected. Not so, however, for the test pieces behaved in every way as they should do, and afforded no clue whatever to the solution of the difficulty. The replacement of three plates out of a strake is not of itself a very serious matter; but this uncertainty which remains as to the condition of the remainder, and, indeed, as to the condition of similar plates in similar ships everywhere is naturally a source of trouble and anxiety. A keel-strake plate cracking across, when a ship is at sea, might cause it to founder without any discovery of the reason why. If three plates of the highest attainable quality, and treated in the most skillful way, fail badly and suddenly after being secured in their places, and without any obvious strain upon them, why should not the same thing or worse occur when the unknown stresses occasioned by heavy seas try them perhaps to the utmost? There is obviously something yet to find out about steel plates. There appears to be an inherent uncertainty of behavior consequent on homogeneity. The very quality that enables steel to beat its competitor iron so easily and so decidedly in tensile strength and in ductility renders it also at certain times and in certain conditions as treacherous as glass. And those conditions, and how to provide against them, no one as yet seems fully to understand. If steel plates, like iron, would only show inferiority by obvious indications during manipulation, they could be submitted to the process of artificial selection. But like hypocritical individuals they always appear immaculate when undergoing observation, and alter their behavior suddenly and completely just when they have established their character for reliability. It is understood that further progress of the vessel in question has been delayed for the present, pending certain inquiries and investigations. As a natural consequence there is a tendency for iron as a ship building material again to come into favor with ship owners, and especially for sailing ships.

Reckoning the Cost of Steam Power.

A fair horse-power in a steam boiler is an evaporation of 30 pounds of water per hour, from a temperature of 212 degrees. Ten pounds of water evaporated from a temperature of 212 deg. for each pound of coal is very high economy. Six pounds is fair work, and above the average. Under the best conditions, a horse-power can be got from an evaporation of less than twenty pounds of water. Every owner of steam power should weigh the water evaporated in his boiler, and also the coal used to produce such an evaporation. A measure of some kind that will show the weight of feed water passing into a steam boiler with accuracy should be used with all boilers when economy is an object. It should be the duty of a fireman to know the weight of fuel used as well as the weight of water. No man has any right to find fault with the economy of his boiler until he knows the amount of water evaporated per hour, and the amount of coal used to produce the same.

The economy of an engine depends greatly upon its size; small engines are more wasteful than large ones; all the items of loss become proportionately greater as the size is decreased, and it is also more difficult to guard against waste with small engines than with large engines. With a good automatic, non-condensing engine, the coal required per horse-power per hour varies from 3 to 3½ or 4 pounds, according to the quality of the coal. A condensing engine of the automatic type, will go somewhat below these figures. Still better economical results than these may be obtained with higher rates of expansion, using a compound condensing engine of moderately large size, employing a steam jacket and adopting every means to prevent waste of heat; the consumption of coal may then be made to go as low as 1½ to 2 pounds per horse-power per hour; and future improvements may be expected to bring about even higher economy than this, which still falls far short of what is theoretically possible.—*Ex.*

AN IMPROVEMENT IN NAIL-MAKING.—It is said that an improved method of manufacturing a semi-wire nail will soon be put in use in some of the Pittsburgh mills, which will revolutionize the nail manufacture. By this method semi-wire nails of square section, boat, barge, track and railroad spikes, as well as the common cut

nails, can be made on the cut nail machines now in use without changing the manner of the operation. The improved cut nails will be of the same pattern and appearance as those now made, except that the inclined sides will be smooth and the parallel sides will be the cut or rough surfaces, thus increasing the adhesive or holding power of the nails. Semi-wire nails made by this method will be of square section, with four parallel sides and a chisel point, while the output will be at least three times that of the regular wire nail. The boat, barge, track and railroad spikes will have the same appearance as the most perfect now made from rods. The heads will not come off in driving, by vibration or extraction, and any shape of head can be produced. In addition to the increase of output, it is estimated that the improvement will save at least \$4 per ton on the labor cost in manufacturing nails and spikes. The only change involved will be a modification in the process of rolling the plates.

How to Learn.

What a mechanic needs most to-day is to know how to think. A man who can do this is never at fault for ways or means. He can meet any emergency. If a difficult job comes along, he rises to it and enjoys conquering the difficulty. He is an inventor. He invents hundreds of things every month of his life.

Such a man loves dearly to go on a tramp. He loves to go into every shop and factory and use his eyes. That man is a scholar. He is at school all the time. He has learned the one vital lesson and knowledge is his. Our man has learned how to learn. Not a shop does he enter, but something appears which he wishes to see. He learns a new kink while he is watching Bob light his pipe or set a lathe tool. He finds a treasure where Mike would see nothing but steel, scrap-iron and \$2 a day.

Perhaps our man has got half an idea as to some improvement to a machine. He is working up his odd minutes in perfecting his invention. As he walks through a shop he sees a jig for some peculiar job. It is nothing but a couple of screws and two pieces of iron, yet it suggests something, and his invention is perfected. Like a flash the mind catches the idea of what is wanted, yet the article which suggested it is no more like it than "elbow grease" is like "taper oil."

When you learn a trade or study a lesson, then learn how to think and how to catch new ideas. Learn this thing, and if you can do it the trade is yours.—*American Machinist.*

BOILER FLUES.—Steel flues were but very little used previous to 1870, and their use at present is not common. They are very thin, wear well in the hands of competent engineers, and with borax as a flux are readily pieced and rewelded to iron ends. It was stated by Mr. Setchel at the late meeting of the Master Mechanics' Association that he had used a few sets of steel flues, but with poor success, until he commenced using "safe ends," about six inches long, made from the very best of iron.

It is generally acknowledged that the flues constitute the most effective heating surface of the boiler, although there are some who dispute this. But the most common assumption is that the relative value of the flue and fire-box surfaces are as one to three. In a paper read before the late meeting of the Institute of Civil Engineers, it was stated that in the analysed work of 19 locomotive boilers the fire box evaporated one-fifth and the tubes four-fifths of the water. Brass or copper flues transmit heat more freely than steel; but it still remains a dispute whether the use of the more expensive metal can be made economical. The general use of iron or steel in preference seems to settle the question, although more careful experiments might throw additional light upon the subject.

CARE OF STEEL BOILERS.—Steel has been tried in numerous cases for locomotive boilers, and abandoned by some, because of the cracking of the sheets that form the fire box. If a boiler having a steel fire box is blown off and washed with cold water before allowing it to cool, the sheets will not crack. But if the boiler is washed out with hot water the sheets will generally crack. On an important railroad they were constantly troubled by cracked steel boilers while purifying the former plan, but since adopting the latter, not a single sheet has cracked. It is also an excellent method to bank the fires, and not let them go out, unless it is necessary to do work on the boilers. The boilers are thus kept free from the damaging and dangerous result occasioned by great and frequent changes of temperature.

HOT JOURNALS AND BOXES.—A contemporary says: There is one thing about journals and boxes that has not been spoken of very much, and that is the circulation of the oil in the box. If the oil circulates throughout the box there is less danger of heating. I have good results in babbiting boxes, especially solid boxes, by taking paper and placing around the shaft, and then taking stout string and tying around the paper in the form of a quick thread, letting the string go right and left. This has a tendency to cause the oil to circulate back and forth throughout the bearing, thoroughly lubricating every portion of the bearing. It is always better to have a box, especially a half box, to bear on the bottom and not on the two edges. A box that is cast or bored on a smaller circle than the shaft is sure to get hot.

SCIENTIFIC PROGRESS.

The Work of the Chemist.

This chemist is coming more and more to the front in the progress of the industrial arts. Nearly every department of industry—the architect, the manufacturer of textiles, the dyer, the workers in metals, and, perhaps, more than all, the agriculturist must kneel to the shrine of chemistry. The architect finds his work continually crumbling away, and he appeals to the chemist for means for its preservation; the manufacturer must have a more perfect knowledge of the nature of the fibres which lie at the foundation of his industry and he calls in the chemist and the microscopist; the dyer must learn the chemical reactions of his colors and their relations to the fibres with which he is required to deal. The workers in metals have, within the last two decades, through chemical investigations, more than quadrupled their power and efficiency in dealing with the stubborn minerals which it is their mission to transform from the unsightly masses in which they appear in nature to the elegant or useful designs and forms which they are made to assume for ornament or use. But perhaps the agriculturist, more than any other, is almost daily acquiring from this same source knowledge invaluable to his calling.

It is through this aid of sciences in all its various fields that the industries of the world have been able to make such wonderful advances during the present century. Science and the industrial arts must go hand in hand for all future time; in fact, science must lead, and should be encouraged in every way by governmental as well as individual effort.

THE PLANET SATURN.—This beautiful celestial orb is now in its most favorable position for observation, being at its nearest approach to the earth and having its rings at an angle at which they show to the best advantage. No one who has the opportunity should fail to improve the present position of that planet in observing and studying its complex system, especially the constitution of the dark spaces between his rings, and the shadowy markings on his disk. The features of this planet's surface are of extreme delicacy. The eye must be practiced, the instrument of the best kind, and the atmosphere clear to give any hope of reaching reliable results. Mr. Denning of Bristol, England, a close observer, gives an interesting report in *Nature* of observations that have been made upon the Saturnian belts during the last few oppositions.

A very definite narrow belt has bounded the southern side of the equator, remarkable for its compact appearance, though exhibiting no distinct spots. One or two observers have detected proofs of condensation. The belts near the pole are so faint that there is doubt if they have really been seen except by the eye of fancy. It is generally agreed that some of the features of the planet are variable, and this accounts for the difference of opinion among observers. Especially is this the case in regard to the division between the rings and the division in the outer ring. These must fluctuate at short intervals, or the evidence of different observers and different telescopes is strangely at variance. There is not much probability that definite results will be reached at the present opposition, even under such favorable conditions. None the less should the observation be thorough, close, and long-continued, for this is the only method by which terrestrial observers can hold communion with the other planets, or learn even the first lessons of what is going on in their distant domains. It is easy to recognize Saturn as he rises in the northeast about 6 o'clock in the evening.

ILLUSTRATING THE STEREOSCOPE.—A contributor to *Cosmos* suggests a curious optical experiment which may serve to show the principle of the stereoscope. If we cut out of black paper two similar figures—two crosses, for example—and place them, their extremities almost touching, at about three inches from the eyes, before a sheet of white paper, we shall see three crosses, the middle one being dark and completely separate. This phenomenon is explained by the simultaneous vision of the two eyes, and it is easy to show this by looking at the objects successively with one eye. The experiment becomes still more interesting when, instead of black figures, we employ complementary colors—red and green, for example. In this case we must use a dark background, and there will appear a white cross in the middle.

A NEW AND INGENUOUS GEOLOGICAL THEORY.—Geologists are very generally agreed in attributing to the action of glaciers an important part in determining the configuration of a large portion of the territory included within the United States; but Prof. J. P. Lesley, the present State Geologist of Pennsylvania, and late President of the American Association for the Advancement of Science, has advanced the curious and very ingenious theory that most of the topographical features of the Atlantic half of the United States, including the erosion of lakes Champlain and Ontario, and Georgian and Green bays, the Blue Grass country of Kentucky, the central basin of Tennessee, the great valley of Eastern Tennessee, Virginia, Pennsylvania and New Jersey, the Taconic valleys of Western New England, and the rich valleys of the interior parts of the Appalachian mountain

belt, have been due to the underground dissolution of the lower silurian limestone formations, and to the consequent breaking down of the palaeozoic roof above the caverns thus excavated, the process beginning, however, with the limestone of the carboniferous and sub carboniferous ages, being continued by the second subterranean erosion of the upper and lower Helderberg limestones, causing lakes Eris, Huron and Michigan, the smaller New York lakes, and the "poor valleys" of the Middle and Southern Atlantic States, and ending with the subterranean erosion of the Trenton and calciferous formations, which, in his opinion, is still going on.

THE FLOOD ROCK EXPLOSION.—Professor W. A. Rogers, of the Harvard observatory, has reported to the American Academy of Arts and Sciences, in Boston, the results of his observations on the transmission of shock from the Flood Rock explosion, which are quite interesting as showing the velocity of underground movements, and the distances from the center of disturbances at which they may be observed. The air line distance between the observatory in Cambridge and Flood Rock is 190 miles, and the observations were timed as follows: Disturbance first seen, 11:17:14; instant of maximum disturbance, 11:18:03; disturbance ceased, 11:20. The method used to develop the existence of vibration was the placing of a saucer of mercury on the solid cellar floor. In this mercury was a speck or flaw. Upon this point was brought to bear a microscope of 750 magnifying power, the spider line being in exact coincidence with the flaw. The first vibration perceived was about a thousandth of an inch, and recurred at intervals for nearly two minutes, the greatest swaying of the mercury being over a space of one five-hundredth of an inch. In this connection it is interesting to note that General Abbot reported that the shock from 50,000 pounds of dynamite exploded in 1876 at Hallett's Point, was transmitted through the drift formation of Long Island, at the rate of 5300 feet per second for 13½ miles. Assuming the figures of the Cambridge report as correct, and that the mine at Flood Rock was exploded at 11:14, seventy fifth meridian time, it took the wave just 194 seconds to travel 190 miles, or at the rate of 5120 feet per second. This is very near the rate of transmission observed by General Abbot, when the greatly increased distance is taken into account.

GELATINE DYNAMITE.—Mr. Alfred Nobel, the well-known inventor of dynamite and blasting gelatine, has improved upon those explosives by introducing what he terms gelatine-dynamite, which combines and gives effect to the qualities of the two great explosives that go to form its name. It has gone little further than the test stage as yet; but accounts of its use in mines, limestone and granite quarries, tunnels and collieries show that it has advantages that the intelligent workmen appreciate; that it does the work of dynamite in places that cannot be well ventilated; and that it leaves so little of an offensive smell that miners can go in almost immediately, feel no bad effects, and go right on with their work.

CAUTION TO AMATEUR ELECTRICIANS.—Certain printed instructions for the preparation of the chromic acid solution for batteries direct that the sulphuric acid be poured into hot solution of potassium dichromate; unless this be carefully done, small portions of the oil of vitriol may be projected into the face of the operator. Bunsen's method is preferable; mix the dichromate, in granular form, with the sulphuric acid, then add cold water, with continued stirring; the union of the acid and water generates sufficient heat to speedily effect the solution of the salt.

ASTRONOMICAL PHOTOGRAPHY.—To such a degree of perfection and effectiveness has astronomical photography been carried that the Messrs. Henry of the Paris observatory have recently obtained a photograph of the cluster in Perseus, showing stars down to the thirteenth magnitude. The negative was obtained in fifty minutes with a 6.3-inch object glass of 83-inch focal length. It has been enlarged four times, and reproduced by helio-engraving.

A NEW EASILY FUSIBLE ALLOY.—*Nature* gives the formula of a new alloy, which is specially adapted to many important uses in the arts. It melts at the low temperature of 160 degrees F., the temperature of moderately hot water, and considerably below that at which the magic spoons of long ago melted in a cup of tea. Its composition is: Bismuth, 48; cadmium, 13; lead, 19; tin, 20. This new alloy will withstand quite a severe pressure.

THE GULF STREAM.—From recent observations Captain Pillsbury finds that the strength of current of the Gulf Stream is invariably on the Florida, instead of the Bahama side of the stream. He has found the temperature of the stream to range from 42 to 81 degrees. The greatest velocity of the stream at the surface is about four and a half knots, but the fluctuations are frequent and great.

ALVAN CLARK HONORED.—The Czar of Russia has bestowed upon Alvan Clark of Cambridge, Mass., the golden honorary medal of the empire "in acknowledgment of the excellent performances of the great object glass" made by Mr. Clark for the chief telescope of the Pulkowa observatory. This medal is given very rarely, and only for extraordinary merits.

SAN FRANCISCO:

Saturday Morning, Jan. 9, 1886.

TABLE OF CONTENTS.

EDITORIALS.—An Automatic Steam Trap; Killing Marine Insects; Measuring Globules of Silver, 21. Passing Events; Running Cable Roads; Precious Metal Product of 1885, 24. Drainage of Water Level in Coal Mines; Mining Accidents; Annual Mining Review; Roscolite and Vanadate of Lead, 25.

ILLUSTRATIONS.—Scale for Measuring Silver Globules from Blowpipe Assays, 21. Fig. 1—The Drain-way Made in the Coal; Fig. 2—Draining where Gang-way is Cut in the Rock, 25.

CORRESPONDENCE.—Montana Mines, 22.

MECHANICAL PROGRESS.—Mysterious Failures of Steel Plates; Reckoning the Cost of Steam Power; An Improvement in Nail Making; How to Learn; Boiler Flues; Care of Steel Boilers; Hot Journals and Boxes, 23.

SCIENTIFIC PROGRESS.—The Work of the Chemist; The Planet Saturn; Illustrating the Stereoscope; A New and Ingenious Geological Theory; The Flood Rock Explosion; Gelatine Dynamite; Caution to Amateur Electricians; Astronomical Photography; A New Easily Fused Alloy; The Gulf Stream; Alvan Clark Honored, 23.

ENGINEERING NOTES.—A Device for Announcing Shallow Water; New Electric Street Railway; Transmitting Power by Electricity; The Shillito; Substitution of Human Labor by Machinery; An Elevated Railway for Paris, 27.

USEFUL INFORMATION.—Celluloid; The Use of Emery Wheels; The Preservation of Ropes; Mechanical Glass Blowing; Engraving on Glass; Lasting Properties of Cypress, 27.

GOOD HEALTH.—Drooping Shoulders; Catching Cold; A New Method of Introducing Medicine into the System; Remedy for Earache; Doctors Must Keep Up with the Times; Borax as an Internal Disinfectant; Irritation from Red Flannel; Medical Plants in Brazil; Erysipelas; Three Little Wicks; Sudden Sickness, 27.

MISCELLANEOUS.—Notices of Recent Patents; Unifried District, Arizona, 22. Practical Hydraulics, 23.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 28-9.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 32.

Business Announcements.

Dividend Notice.—Hibernia Savings & Loan Society.
Books—Wm. S. Duncombe & Co.

Passing Events.

The most notable event in connection with mining matters now being discussed is the new and rich discovery of silver carbonates on Carbonate Hill, just out of the city limits of Leadville, Col. The drifts show that the "blanket vein" is two acres in extent, yielding \$20 per ton, and it is estimated that the deposit will yield from \$4,000,000 to \$6,000,000.

Fresno county mining interests are looking up satisfactorily and this summer a great deal of work will be done.

The statistics of production of precious metals for the year 1885, just published, show that California still keeps second place as she has for many years.

Deeper explorations are being made on the Comstock, and great hopes are entertained of meeting another big bonanza.

The silver question is being discussed in Congress. From present appearances the bullion-producing regions can rest content that silver will not be demonetized.

THE MINERS' SIDE of the debris question has been taken in a memorial to the Secretary of War. We shall publish the memorial in full in the next number of the PRESS.

GENERAL CROOK is to be superseded in Arizona by General Miles.

Running Cable Roads.

Experience in San Francisco and on the Brooklyn Bridge.

In the discussion now going on in the East on papers of the question as to whether the Brooklyn Bridge management are using the best, latest and most improved gripping, brake and other mechanical appliances for the safe and efficient operation of that cable railway, it is evident that there is a lack of information on the subject, and especially as regards San Francisco cable roads. In a letter a short time ago, referring to the matter, a well known engineer says: "The requirements of a grip for the Brooklyn Bridge are much greater than on any other cable road in existence," and in the *American Machinist* of December 26th Mr. Chas. T. Porter says the requirements of the Bridge traffic are very severe. The idea is given that the requirements are more severe than ever before encountered. This is a mistake and evidently made without a knowledge of the facts.

Mr. Martin, chief engineer of the Bridge, is also quoted as saying that Paine's grip is now in use by a cable road in San Francisco, under license from Col. Paine. Mr. Martin must refer to the Sutter street road, as that company is the only one in San Francisco that ever took out a license from Col. Paine. The facts are as follows: The Sutter street road was opened as a cable road late in the summer of 1876, using Hovey's lever grip, but with Paine's combination of grip rollers and brakes on the same instead of solid jaws. The grades on that road are only seven per cent, but a great deal of trouble was experienced with that grip. The rollers operated like a rolling mill, and lengthened the cable rapidly by the great pressure required being confined to a small surface, and also broke up the surface wires rapidly. When the loads were large the gripman could not exert force enough on the lever to prevent slipping of the cable through the grip. In less than six months from the time the road was opened as a cable road, all of Col. Paine's brake rollers had gone to the scrap heap, and none has ever been used on that road or any other in San Francisco since that time.

We are not in possession of exact figures for the weight of the cars now used on the bridge, but will assume it to be 25,000 pounds each. Assume an additional standing capacity for passengers of four times the seating capacity, which, if we remember aright, is 44, making a total capacity of 220 passengers per car. This, at 125 pounds each, will make the total weight of passengers 27,500 pounds, and of the cars fully loaded 52,500 pounds. Assuming the friction to be 40 pounds per ton, the resistance due to friction would be 1050 pounds, and that due to the grade of three and a half per cent would be about 1575 pounds, a total of 2625 pounds total resistance for one car fully loaded ascending the steepest grade on Brooklyn bridge. The figures are not exact, but are not far from the truth. Now let us compare this with one of the hill roads in San Francisco—say the one on California street.

The grade on this line from Dupont to Stockton streets is 18.2 per cent, and on the next block but slightly less. The car and dummy used on that road weigh something over 8500 pounds. Sixty passengers is not an unusual load (110 having been carried up that grade at one load), which, at 125 pounds each, would make the total weight of loaded car and dummy 16,000 pounds. Such a load can be found every day, about six o'clock in the evening. The resistance due to friction, at the rate of 40 pounds per ton, as before, would be 360 pounds. The resistance due to the left on a grade of 18.2 per cent is about two-elevenths of the total weight, equal to 2900, making the total resistance 3260 pounds, which is considerably greater than that encountered on the Bridge. Yet the grips give no trouble, and there is no possibility of the cable slipping out of the grip on the grade, and one cable has run more than 22 months on this line. It is frequently necessary to stop on that grade, but the car is held securely, by means of the rail safety-brake, which is free from all complication; but if the ascending car is stopped by any obstruction, they are required to back down to the crossing of the street below, before starting, to avoid damaging the cable. On the Clay Street Hill road, near by, the grades are about the same, but the cars are not quite so

heavy. The Clay street was the first cable road ever constructed, and has been in operation more than 12 years. The Sutter street cable road has been in operation nine years, the California street nearly eight years, Geary street cable road six, Union street cable road five, and the Market street road, which is through the most important and busy street in San Francisco, about two years and four months. The safety rail brake is conceded essential to all roads having steep grades, and is used by all the cable roads here except the Geary street.

We are aware that it is much more severe on the cable starting a load of 52,000 than 16,000 pounds under the same conditions, but the Bridge cars always make the start at the same places, and only have to start twice on a round trip, and it would be an easy matter to make the track down-grade in the direction of the travel for a distance of 50 or 75 feet at the starting places; while on the Market street road of San Francisco, cars are required to stop anywhere a passenger may desire to get on or off, so a car frequently makes forty stops and starts to each round trip, and half of them on some up-grade.

There is no trouble for any experienced gripman starting without any severe shock, but they must start quickly to make the time between terminal points with the large number of stops for passengers they are required to make. On the branches of the Market street road leading to the park the grades are 12 3/10 per cent. The cars weigh 10,000 pounds each, and bays carried up that grade as high as 151 passengers, making a total weight of over 28,000 pounds. The cars are only two minutes apart on Sunday, and the average load of all the cars going up the grade for an hour, by actual count, was 116 passengers.

It is frequently necessary to stop on these grades, and if these cars had to depend on wheel brakes alone, collisions would be frequent, as a car will slide down such a grade on a slippery track with all the wheels locked, when once in motion, so the safety brakes are a necessity.

There is another feature of the Bridge arrangement that cannot be too severely condemned as being unhandy and dangerous. That is, the hitching of the grip and brake together on the same operating mechanism so that the wheel brakes even cannot be applied until the grip is released. The brakes should be entirely separate from the grip operating mechanism, and a lever is preferable to any hand-wheel and brake-staff when a man is excited, for the reason that the motion required to apply the brakes by means of a lever is quick, direct and unmistakable, far more so than can be obtained by any other motion.

If these gripping and brake devices used on the San Francisco roads were new and untried, or only existed on paper, the case would be entirely different, but after from six to twelve years of constant every-day use of these devices on six roads in San Francisco, on grades more than five times as heavy as those on the bridge, and one of these roads has carried over 70,000 passengers in one day, the actions of the Bridge Trustees committee in establishing an office for the purpose of testing and passing upon the merits of such grips as may be presented, must have been taken without a full knowledge of the state of the art. It must be apparent to any practical man like those on that committee that any office test is of little value, as compared with that of every-day use through a period of several years.

The arrangements for handling the cable at the engine-house in emergencies appear to be far behind the times, from the fact that it takes nine or ten hours to put in a piece of strand.

There appears to be no provision made for extra cable between the drivers and shifting tightener to be used for re-splicing in case the cable is damaged. All these things cannot be changed at once, but it does seem as if this should be managed as a business proposition, instead of wasting time with crank inventions and their devices that have been tried and discarded elsewhere years ago.

PLACER AND LOBE CLAIMS.—An item this week in the daily papers concerning the Good Return placer claim, speaks of annual expenditure being required on placer as well as on lode claims. The subject was very fully discussed, and the decision referred to given in detail in the MINING AND SCIENTIFIC PRESS last week.

Precious Metal Product of 1885.

The following is a copy of the annual statement by John J. Valentine, Vice-President and General Manager of Wells, Fargo & Co., of precious metals produced in the States and Territories west of the Missouri river, including British Columbia, and receipts by express from the west coast States of Mexico, during 1885, which shows aggregate products as follows: Gold, \$27,290,294; silver, \$46,489,939; copper, \$7,838,036; lead, \$8,562,991; total gross result, \$90,181,260.

As stated hitherto, the facilities afforded for the transportation of bullion, ores and base metals, by the extension of railroads into mining districts, increase the difficulty of verifying the reports of the products from several important localities, and the general tendency is to aggregation when the actual values are not obtainable from authentic sources, but the aggregate result, as shown herein, we think, may be relied on with reasonable confidence as approximately correct.

The exports of silver during the past year to Japan, China, the Straits, etc., have been as follows: From London, \$36,979,720; from Marseilles, \$1,067,220; from Venice, \$726,000; from San Francisco, \$17,337,000. Total, \$56,109,949, as against \$55,617,578 last year. Pounds sterling estimated at \$4.84.

Drainage of Water Level in Coal Mines.

A work on coal mining, by Thos. H. Walton, has recently been issued by Henry Carey Baird & Co., a copy of which we have received from A. L. Bancroft & Co., of this city. There are many large and elaborate plates after actual workings and apparatus, and several wood engravings, in the book, and the text is novel from its "practical" character, science and mathematics having been set aside in favor of practical details. Some of the descriptions are carried out by imaginary dialogues between workmen, foremen, etc. We quote one of these dialogues on the subject of the proper method of cutting the gutter or drain in the water level of a coal mine.

"Bill, would it not be better to have the gutter on the upper side of the track; cut away into the bottom slate for instance?"

"That is what I have never seen before," growls Bill; "it seems unnatural to have the gutter on the high side."

"But which is the high side?" asks Harry. "For my part, the gutter being placed in this manner in the bottom slate at the lowest point would be literally in the lowest side, and I would call it the low side. Here we have it," and Harry draws a sketch and discusses its merits (Fig. 1).

"Now here is your old gutter in the coal at A. Here is the gutter to be cut out of the bottom rock at B, and so deeply into it as to be used as a water course after this lift has been abandoned and worked off."

"What use would it be then?" asks Bill, bluntly.

"Don't you see it would collect all the water coming over the bottom slate from the surface and pass it off without hothering the pumps of our lower lifts, after the workings of the lower levels fall through or are driven into this water level gangway?"

"But look at the extra expense of cutting the gutter in the rock; it would cost an additional two or three dollars per yard. And then what will it matter to us or our owners; we may be, God knows where, when the lower lifts are worked."

"Now, Bill, look here!" interrupts Harry. "If this were my property, and you were a lessee, you would not extract a pound of the coal from this water level unless you agreed to build a permanent water course as you progressed with your water level mining. I should not be so green as to lease any of my property to be ruined by any parties who would not lease with a clause inserted to bind them to such an arrangement. Look at that gutter! it is flooded. There are not less than three hundred gallons of water per minute delivered by that shabby little drain of yours. Now when this coal is worked below us—which it will be within a dozen years of this time—that water will be pumped up from the next lift, and then, after that, from the deeper lifts second and third, and Heaven only knows how far it will run down into the mines when they are opened below us in after years."

"Yes! but how would you build and support this permanent water level?" asks Bill, in a tone of assurance.

"By driving the whole gangway into the bottom rock, and by securing it with timber set up in the 'jugglar' fashion, according to Fig. 2. By using packing behind the legs in the manner represented, after a portion of the solid coal has been removed, we should avoid the serious crash which comes on timber which is wedged up against it with nothing intervening to mitigate the immense strain. Besides forming a permanent water level, it would form a permanent gangway, which is more desirable still, as it would not require relief timbers. Stumps of coal would not be required above the gangway. Then look at the room we have for a monkey gangway to use an air-course either in the position shown at A or at B (Fig. 2); a single prop would suffice at A and double timbers at B. In addition to these advantages we could work the breasts of our lower lifts clear up in this level and cause it to suffer no injury."

After Bill examines the sketches which Harry has drawn in his dirty time book, he ventures to ask concerning the cost of such a gangway.

"With the use of a compressed air drill," says Harry, "I could drive such a gangway for \$20 per lineal yard, which is less than this our present gangway will swallow up before it is finished, after it has been supplied with its sets of relief timbers, besides other repairs. In addition we would be able to get about 100 tons per yard more before we robbed any of the pillars."

"I do not see how we can do that," says Bill. "I have just told you I would not leave the stumps above the gangway of this lift. I would drive my chutes to the top slate and open the breast close to the upper edge of the gangway, and thus have the benefit of 24 feet of breast more than I have. Then in the next lift below I would drive the breasts entirely up to this gangway and take advantage of the rock passage for an air-course."

"That would certainly be a great advantage to the people of the lower lifts. It would drain off the light gases they will have. Look, here are a number of gas bubbles escaping at all times in this place," says Bill, with a little more of grace in his tone. And he takes his lamp and puts the flame into contact with the

escaping bubbles, and lo! a little blue flame shoots out of the gutter as the bubbles burst. "I bet they will have a hot shop down in that quarter of the mine when they come to open it out," chuckles Bill, in a manner indicating that he will not be of the party which is to contend against the gases in the lower levels of the mines.

"All right, Bill, I have just been fooling you into a better temper: we shall not drive the gangway into the bottom rock. The people here will think us crazy if we propose such a plan, and we are not the land-owners, nor are our employers anything but lessees of very short

Fig. 1.

THE DRAIN-WAY MADE IN THE COAL.

duration, unfortunately for themselves and the land-owners, too?"

"We will go on and get to No. 8 and see if this scientific man has any suggestions to make about the air-current. He has told us not a word of the subject of drainage, nor of my proposed method of working a water level. I con-

in a horribly mutilated condition. He was a native of Cornwall, about forty-five years of age, and leaves a wife and three children.

On Monday John Livingston found Thomas Lee, an old miner of the vicinity, in a mining claim on Knapp's ranch not far from Columbia,

Fig. 2.

DRAINING WHERE GANGWAY IS CUT IN THE ROCK.

clude they are subjects above his science," says Harry, in tones of pretended sarcasm.

"I can find not the shadow of a fault with the remarks you have made," you say. "Bill has suggested the great idea of using the road you have proposed to make as an air-course, which gives your water-course a double capacity. I have given you both great credit for your respective suggestions, and I shall take the first opportunity of sounding your praises."

HOMES FOR CHILDREN WANTED.—We are requested to say that boys and girls may be had—particularly boys—for service at wages, for indenture or for legal adoption, by applying with recommendations to E. T. Dooley, Supt. Boys and Girls' Aid Society, 68 Clementina St., San Francisco.

Mining Accidents.

On Tuesday last a fatal accident occurred in the Eureka mine, on Ruby Hill, Eureka District, Nev. William Peters, while running a carload of waste rock from the workings on the third level of the station there, to have it hoisted to the surface, ran it into the shaft. Both man and car fell to the bottom of the shaft, a distance of over 500 feet. The remains of the unfortunate man were found shortly afterward

not commenced until the next morning, when the body was extricated.

Last week Ormshee Groom, a well-known miner, working in the Valley View mine, near the town of Chloride, Arizona, fell down the shaft and was killed. The shaft in which the accident occurred is on an incline of about 45 degrees, the drift being some 35 feet from the surface. Labrosse says that he was sitting in the drift, about two feet from the shaft, waiting for the bucket to come down, and hearing a noise, looked up the shaft and saw Groom plunging down head foremost, the latter being about five feet above the drift when Labrosse first caught sight of him.

Roscoelite and Vanadate of Lead.

In last week's PRESS mention was made of the mineral vanadate of lead, a large deposit of which is said to have been found in Montana, and worth \$10,000 per pound. We stated that, though the mineral was very rare, and a small quantity might bring a high price as a specimen, no such figure as that mentioned could be obtained. Its main value lay in the vanadic acid it contained, which is valuable as a mordant in dyeing.

As further proof of the statement we made as to value, an instance may be cited. Roscoelite, which is vanadic oxide, was named for Prof. Roscoe, who first isolated vanadium. The mineral has been discovered, thus far, in California only. A short time since a large deposit of gold dust was received by Prof. Price, of this city, mixed, so the correspondent said, with a base material. An examination of this "base" proved it to be Roscoelite. Some of this Prof. Price shipped to England, but could make no market for it.

Attention was first called to the mineral Roscoelite in a paper by James Blake, at a meeting of the San Francisco Microscopical Society. The specimens were from near Coloma, El Dorado county, in this State. The same gentleman also presented specimens to the California Academy of Sciences, from Granite Creek, same county. He sent samples to Dr. Genth, of Philadelphia, who found the mineral to contain vanadium. An analysis was made by Prof. S. H. Roscoe, of Owen's College, Manchester, England, as follows:

Silica	41.25
Vanadic acid (V ₂ O ₅)	23.60
Alumina	12.84
Sesquioxide of iron	1.13
Oxide of Manganese	1.10
Lime	.61
Magnesia	2.01
Potash	8.56
Soda	.82
Water combined	1.08
Moisture	2.27

In the State Mineralogist's second annual report this mineral is described, and in the fourth report there is still fuller reference to it. The main point in this connection, however, is the fact of the large percentage of vanadic acid it contains which is supposed to give the high value to vanadate of lead. As it was not salable in England, it is hardly probable that any \$10,000 a pound would be given for vanadate of lead.

Moreover, Montana is not alone in possessing vanadate of lead. Prof. Wm. P. Blake found it at Castle Dome District, Arizona, just beyond the line of this State, across the Colorado. It occurs in considerable abundance in the Railroad claim there. It has also been found in Crystal District, in the Hamburg mine. These specimens were found as long ago as 1880, and were described by Prof. Blake at the time. A complete description of the vanadates of lead of the Castle Dome mines will be found in the State Mineralogist's second annual report.

Annual Mining Review.

On the 23rd inst. we shall publish in the MINING AND SCIENTIFIC PRESS our usual annual review of mines and mining. We are gathering very full statistics and information for this double number of the PRESS, which will be filled with matter of interest to the mining community. We shall be glad to have any of our readers in the various camps send us such information as they have concerning progress and condition. These letters we will receive with pleasure. Send us the news, and we will put it in shape. This review will embrace in its scope not only this State, but Nevada, Oregon, Washington, Arizona, New Mexico, Utah, Idaho, Montana and Colorado. It will show the condition of the mining industry and the results of last year's work.

PRACTICAL HYDRAULICS.

NUMBER 12. COPYRIGHTED.

PRINCIPLES OF HYDRAULICS.

Written for MINING AND SCIENTIFIC PRESS by P. M. RANDALL.]

By Table 6, square root of head $\sqrt{9.06}=3.01$ nearly.By Rule 27, $Q=.900 \times 8.025 \times .1963 \times 3.01=4.27$ cubic feet.—Ans.

Divergent Tubes.—Experiments show that the flow of water through a short divergent tube is similar to that in a thin plate. The coefficients of which are given in Table 9. In ordinary practice .62 is employed.

In case a vacuum is formed in a divergent tube, the flow is greatly increased, so that it may then even exceed the theoretical flow due the force of gravity, through an orifice in a thin plate, whose diameter is equal to that of the smaller diameter of the divergent tube; in other words, its coefficient of flow becomes greater than unity. The conditions effecting this result are a high velocity of flow in a tube of small divergence, and whose length is several times its smaller diameter. Thus, the smaller diameter of a divergent tube being 1.32 inches, the length 9 times this diameter—11.88 inches, the included angle of the tube equal to $5^\circ 6'$, and the head of water 2.89 feet. Venturi found the coefficient of flow equal to 1.46, or 2.4 times that of an equal orifice in a thin plate. If the entry end of an otherwise similar tube be bell-mouthed in form, the coefficient of flow estimated for smaller diameter will evidently exceed that obtained by Venturi. The principle of the formation of a vacuum by flowing water at a high rate of velocity, through a divergent tube, and thereby greatly increasing the volume of discharge, was known to the ancients. D'Aubuisson states that the application of the principle, at a distance less than 52.5 feet from the public conduits, by Roman citizens having grants of water, was prohibited by Roman law.

TABLE 14.

Coefficients of the flow of water through divergent tubes.

Angle.	Length of Tube, Feet.	Coefficient.	Angle.	Length of Tube, Feet.	Coefficient.
$3^\circ 30'$	0.364	0.93	$5^\circ 44'$.193	.82
$4^\circ 38'$	1.095	1.21	$10^\circ 16'$.865	.91
$4^\circ 38'$	1.508	1.21	$10^\circ 16'$.147	.91
$4^\circ 38'$	1.508	1.34	$14^\circ 14'$.147	.61
$5^\circ 44'$	0.57	1.02			

Ex. 60.—In a divergent tube the smaller diameter being .61 of an inch, the length 1.508 feet, the angle included between its sides $4^\circ 38'$, and the head on center 2.89 feet, what is the volume of flow in cubic feet or 24 hours?

Cal.—Diameter .61 inches—.0508 feet.

By Table 14, mean coefficient of discharge $(1.21 + .34) \div 2 = 1.275$.

Area of cross-section of tube, $.0508 \times .0508 \times .7854 = .002027$ square feet.

By Table 6, square root of head $\sqrt{2.89}=1.7$.

By Rule 27, volume of discharge per second.

$Q=1.275 \times 8.025 \times .002027 \times 1.7=.03525$.

In 24 hours are 86,400 seconds; hence, $.03525 \times 86400=3046.05$ cubic feet.—Ans.

Ex. 61.—In a compound tube, Fig. 18, the cylindrical part, P, is .0853 feet in diameter, 2.0605 feet in length; the convergent part, C, .2559 feet long; the divergent part, D, .7667 feet in length; and the head 2.3642 feet. What will be the discharge in 10 hours?

Cal.—By Table 15, the coefficient of flow due to P D=.905.

Compound Tubes.—Compound tubes are of various forms. Eytelvine, as stated by J. T. Fanning, after experimenting with cylindrical tubes of uniform diameter and different lengths, placed between them and the reservoir, convergent tubes of the form of the contracted vein, and renewed the experiments; these added to the discharge end a divergent tube with $5^\circ 6'$ angle. Fig. 18.

FIG. 18.

In Fig. 18, C represents the conically convergent part of the tube of the form of the contracted vein; the cylindrical part of uniform diameter, but of different lengths, and the conically divergent part

with $5^\circ 6'$ angle. The results obtained are given in the following table:

TABLE 15.

Coefficients of the flow of water through compound tubes.

Head, Feet.	Diameter of P, Feet.	Length of P in Feet.	Length of P in Feet.	Coefficient for P.	Coefficient for C P.	Coefficient for C P D.
2.3642	0.0853	0.038	0.0033	0.62
2.3642	0.0853	1.000	0.0853	.62	.967
2.3642	0.0853	3.000	0.2559	.82	.943	1.107
2.3642	0.0853	12.077	1.0302	.77	.870	.978
2.3642	0.0853	24.156	2.0605	.73	.803	.905
2.3642	0.0853	36.233	3.0907	.68	.741	.836
2.3642	0.0853	48.272	4.1176	.63	.687	.762
2.3642	0.0853	60.116	5.1479	.60	.648	.702

Area of cross-section of tube P, $.0853 \times .0853 \times .7854=.005761$ square feet.

By Table 6, the square root of head $\sqrt{2.3642}=1.54$ nearly.

By Rule 27, $Q=.905 \times 8.025 \times .0057 \times 1.54=.06367$ cubic feet per second.

In 10 hours are $3600 \times 10=36,000$ seconds; hence, $.06367 \times 36000=2292.07$ cubic feet.—Ans.

Divergent and Compound Tubes.—These tubes seldom find a place in practice. The lessons, however, which they teach, are of interest, and serve to stimulate the vigilance of the engineer, lest irregularities occurring from design or otherwise, shall elude his observation in matters of importance.

Flow of Water Through Pipes.

FIG. 19.

The flow of water through a pipe is estimated to begin at a point where the stream, after contraction, expands so as to fill the pipe, as at F G, Fig. 19.

The part, D F G, performing the office of a short tube, is, as hereinbefore shown, from 2.6 to 3 times the diameter of the pipe.

The total head, A D, consists of three parts: A B, which generates the velocity; B C, which overcomes the resistance of entry; and C D, which overcomes all resistances in the pipe, F G E. C E is termed the hydraulic gradient, and is such, if the pipe is running full, the water will rise to this grade through tubes, as a b, c d and e f.

Short and Long Pipes.—A pipe, exclusive of the tube portion described, in case its length does not exceed a thousand times its diameter, is termed a *short pipe*, and in case its length exceeds a thousand times its diameter, is termed a *long pipe*.

Let, in Fig. 19:

$h=A D$, the total head.

$h_v=A B$, the velocity head, or head necessary to generate the velocity v .

$h=B C$, the entry head, or head necessary to overcome the resistances of entry.

$h_i=h_v+h_e=A C$, the inlet head, or head necessary to generate the velocity, v , in the pipe, and to overcome the resistances of entry.

$h_f=C D$, the head necessary to overcome the resistances within the pipe.

v =the measured velocity of discharge.

v_i =the theoretical velocity due the head $h_i=A C$.

c =the coefficient of flow in a short tube (length to diameter as 3 to 1), as determined by experiment.

$c_v=C$, the coefficient of velocity, as the stream, after contraction, fills the pipe.

c_e =the coefficient of entry.

c_f =a variable coefficient for the resistances within pipes, as determined by experiment.

d =internal diameter of pipe.

p =perimeter or internal contour of pipe.

a =area of cross-section of pipe.

l =length of pipe.

s =size of slope.

r =hydraulic mean radius.

f =amount of resistances to flow in the pipe.

w =weight of water discharged during the time of resistance to its flow.

Then there results:

$$\text{Equation of total head, } h=h_v+h_e+h_f. \quad (108)$$

$$\text{Equation of entry head, } h_e=h_i-h_v. \quad (109)$$

$$\text{By equation (8), velocity head, } h_v=\frac{v^2}{2g}. \quad (110)$$

$$\text{By equation (8), inlet head, } h_i=\frac{v_i^2}{2g}. \quad (111)$$

Equation of theoretical velocity due inlet head,

$$v_i=\frac{v}{c_v}. \quad (112)$$

Substituting the value of v_i of (112) in (111),

$$h_i=\frac{v^2}{2g c_v^2}. \quad (113)$$

Substituting the values of h_i of (113), and of h_v of (110) in (109),

$$h_e=\left\{\frac{1}{c_v^2}-1\right\}\frac{v^2}{2g}. \quad (114)$$

$$\text{Putting } c_e=\left\{\frac{1}{c_v^2}-1\right\}. \quad (115)$$

Substituting c_e for $\left\{\frac{1}{c_v^2}-1\right\}$ in (114),

$$h_e=\frac{c_e v^2}{2g}. \quad (116)$$

The work performed by the weight, w , falling vertically by the force of gravity through the distance, h_f , in one second, is

$$F=w h_f, \text{ "foot pounds."} \quad (117)$$

Experiments show that the amount of resistances occurring from friction of the internal surfaces of a pipe, and from other causes, varies nearly as the square of the velocity, v .

Experiments also show that the amount of resistances increases directly as the length, l , of the pipe, and inversely as its diameter, d , or hydraulic mean

$$\text{radius, } r=\frac{a}{p}.$$

The work performed by the force of gravity, in overcoming these resistances, so as to effect the discharge of the weight, w , of water with the velocity, v , per second, as first proposed by Chezy, and subsequently adopted by most authors on hydraulics, is

$$F=\frac{w c_f p l h_e}{a} \text{ "foot pounds,"} \quad (118)$$

in which c_f is a variable coefficient whose values are determined by experiment.

Substituting the value of $h_e=\frac{v^2}{2g}$ of (116) in (118), equations (117) and (118),

$$w h_f=\frac{w c_f p l v^2}{2g a}. \quad (119)$$

$$\text{Dividing (119) by } w, h_f=\frac{c_f p l v^2}{2g a}. \quad (120)$$

Substituting the values of h_v of (110), h_e of (116), and h_f of 120, in (108),

$$h=\left\{\frac{v^2}{2g}+\frac{c_e v^2}{2g}+\frac{c_f p l v^2}{2g a}\right\}. \quad (121)$$

$$\text{Factoring (121), } h=\left\{1+c_e+\frac{c_f p l}{a}\right\}\frac{v^2}{2g}. \quad (122)$$

Transposing (122) with respect to v ,

$$v=\left\{\frac{2gh}{1+c_e+\frac{c_f p l}{a}}\right\}^{\frac{1}{2}}. \quad (123)$$

$$\text{Hydraulic radius, } r=\frac{a}{p}=\frac{\pi d^2}{4\pi d}=\frac{d}{4}. \quad (124)$$

Substituting $\frac{1}{r}$ for $\frac{p}{a}$ of (124) in (123),

$$v=\left\{\frac{2gh}{(1+c_e)+\frac{c_f l}{r}}\right\}^{\frac{1}{2}}. \quad (125)$$

Factoring (125),

$$v=(2gh)^{\frac{1}{2}}\left\{\frac{1}{(1+c_e)+\frac{c_f l}{r}}\right\}^{\frac{1}{2}}. \quad (126)$$

Under the heading, "flow of water through short tubes," the value of the mean coefficient of discharge has been shown to be $c=.815$. But $c=c_v=.815$; that is, the coefficient of flow at the inlet orifice of a short tube, is equal to the coefficient of velocity in the pipe, estimating the beginning at that point, where the stream, after contraction, expands so as to fill the pipe.

Substituting the value of $c_v=.815$ in equation (115),

$$c_e=.505. \quad (127)$$

Substituting the value of $c=.505$ in (125),

$$v=\left\{\frac{2gh}{1.505+\frac{c_f l}{r}}\right\}^{\frac{1}{2}}. \quad (128)$$

In determining the velocity of flow in a pipe, whose length exceeds a thousand times the diameter, the value of $(1+c)$ in (125), being small in comparison

ENGINEERING NOTES.

A DEVICE FOR ANNOUNCING SHALLOW WATER.—A curious invention especially designed for navigating the Nile, but which is applicable to other rivers, has been brought out by Messrs. Yarrow, of Vickburg. The object of the invention is to notify the pilot of the existence of sand banks or rocks lying directly in his pathway. The invention consists of two poles projecting about 50 feet ahead from the post and starboard sides, at the end of which are suspended two vertical iron rods. The bottom extremities of these come about one foot below the level of the boat itself. Attached to each of these vertical iron rods is a wire rope, which passes inboard, and is connected with the whistle on the boiler; and the gear is so arranged that immediately this indicator touches a rock or sandbank, it instantly causes the steam whistle to blow. This plan, in the first instance, draws the pilot's attention to the fact, and also points out to him on which side of the steamer the sandbank or rock exists, so that it gives him warning in which direction to steer.

A NEW ELECTRIC STREET RAILROAD.—An electric street railroad is nearly completed in South Bend, Ind., built on the Van Dusele system. The current is led to the cars by an overhead wire upon which a traveler runs, and, as there is only a single wire, special arrangements are provided to allow the travelers moving in opposite directions to pass one another. The energy is obtained from two large dynamos, both fields of which are excited by a single exciting dynamo. The machines are run by water power. The tracks constitute the return circuit, and to make a good circuit strips of brass are laid under the joints of the rails. The speed of car is under full control by means of switches, and the road will soon be in regular operation.

TRANSMITTING POWER BY ELECTRICITY.—Some experiments which have been made at Creil, France, on the transmission of power by electricity do not seem to have been eminently successful. The idea seems to be to utilize the power of distant waterfalls to generate the power, which is then conveyed to any desired point by electricity, and there used for any desired purpose. Theoretically this seems to be all right, but practically, for manufacturing purposes, it seems to be decidedly cheaper for a man to locate his shop close to the source of power, and use it directly, instead of at second hand. In these days of railroads and cheap transportation, it is found cheaper to transport manufactured goods than power, with its attendant loss of 50 per cent, to say nothing of its uncertainties.

THE COFFER DAM was well known to the ancients, and was generally used by them in some form to protect them in sinking the foundations of bridges, and other similar purposes, where loose earth or water interfered with the progress of the work. In this age of railroads and stone docks it is often necessary to build in situations where the coffer dam is impracticable, on account of the great depth required to find a secure foundation. Hence the invention and importance of the caisson. There are many modern engineering triumphs which would never had an existence had it not been for this modern invention.

THE STILETTO.—No event in the last twenty years has created so profound and widespread an interest among shipping merchants, steamboat men and yachtsmen, as the performance of the little steam yacht Stiletto, in beating the fast steamer Mary Powell. The hull of the Stiletto is the product of a series of experiments, made with models in the same manner as was followed by Froude, the English ship-builder. The engine is built so as to produce the greatest amount of power with the least possible amount of vibration. The boat has made the extraordinary speed of twenty-five miles an hour.

SUBSTITUTION OF HUMAN LABOR BY MACHINERY.—Mulhall, in his "Progress of the World," writes that in effect the invention of machinery has given mankind an accession of power beyond calculation. The United States, for example, he says, makes a million sewing machines a year—a large overestimate—which can do as much work as formerly required 12,000,000 women working by hand. A single shoe factory in Massachusetts turns out as many pairs of boots by aid of machinery as 30,000,000 boot-makers in Paris, who do not use machinery.

THIS YEAR will see the completion of one of the greatest submarine engineering feats ever undertaken in Britain. The Severn tunnel was first begun by the Great Western Railway sixteen years ago, and the accomplishment of the great work has been delayed by difficulties which a few years back would have been thought insurmountable. The enterprise has cost considerably more than five million dollars.

AN ELEVATED RAILWAY FOR PARIS.—Jules Garnier has designed an elevated railway for the city of Paris, which is to be completed in time for the Exposition of 1889. *Science* says this will be about 13 miles long, and will cost \$10,000,000. The structure will be composed of two tracks, one above the other, on an iron frame.

USEFUL INFORMATION.

CELLULOID.—The manufacturers of this extraordinary substance have succeeded within the past few years, not only in decidedly improving the quality and the mode of manipulating it, but also in considerably extending its uses. At the Novelties Exhibition lately held in Philadelphia, the exhibit of the Celluloid Manufacturing Co., of Newark, N. J., was universally acknowledged to be the most beautiful and attractive of the many fine displays, for which it was noted. The following enumeration of the numerous products of celluloid there to be seen, from the official catalogue will give an idea of the extent to which this material is employed at the present time in the arts. The inventors truly have given the world a new material, capable of an almost indefinite number of uses, as a substitute for other materials, and in most of the cases when this substance is used, it proves to be better adapted for its intended purpose than the original. At the recent Novelties Exhibition, celluloid was shown in rods, tubing, sheet and rolls, and in not less than seventy-seven different manufactured forms, among which were the following: Brushes, combs, mirrors, and toilet articles in imitation of ivory, coral and amber; collars and cuffs, jewelry, cork-screws, card cases, soap cases, powder boxes, paper knives, thimbles, restaurant checks, shoe hooks and horns, napkin rings, mouth pieces for pipes, parasol, umbrella and cane handles, etc., in imitation of coral, ivory, malachite, tortoise-shell, amber, lapis lazuli, agate and carnelian, etc.; piano keys and organ-stop knobs, in imitation of ivory; white and colored letters for signs, monograms, trademarks, etc.; stereotype plates and type and wood cuts, moldings and veneers for picture frames, show cases, cornices, panels, etc., in white and colors; mountings for spectacles, eyeglasses, opera glasses, etc., substituting and imitating hard rubber, horn, tortoise-shell, etc.; handles for table cutlery, plates for artificial teeth, trimmings, whip handles and pencil cases, statuettes, rollers for skates, spoons and forks, fancy leather for hand satchels, etc.

THE USE OF EMERY WHEELS.—Malleable iron, wrought iron and copper are the hardest things you can use an emery wheel upon, because they are the softest, and the points of emery take a deeper bite or hold on them. It becomes a question of which is the toughest—the cement of the wheel, or the metal it is acting upon. Soft metal will pull the emery grains out of the wheel bodily, and therefore a wheel used upon soft metal will wear out faster than upon hard metal. Steel and chilled iron do not wear a wheel nearly so quick as the softer metals, because, being harder than malleable iron, wrought iron, copper or good brass, the points of emery do not take so rank a cut.

If an emery wheel is out of round and jumps in use, a piece of bar copper, used instead of a diamond, and held on the rest firmly, so as to come in contact only with the high portions, will remove such portions and restore the wheel to a true surface faster than many would suppose. It is a good substitute for a diamond. The wear and loss of one ounce from the copper now and then is less costly than the diamond. If users of emery wheels would realize that an emery wheel has no intelligence, and would place it in charge of men who have, and give it one-half as much attention as other tools, much better results would follow, and less complaints would be made, which complaints, in 99 cases out of 100, reflect directly upon the user instead of the wheel itself.

THE PRESERVATION OF ROPES.—The preservation of scaffold ropes is a matter of great importance when scaffolding remains erected for any considerable time, especially in localities where the atmosphere is destructive of hemp fiber. It has been suggested that in these cases the ropes should be dipped, when dry, into a bath containing 20 grams of sulphate of copper per liter of water, and kept in soak in this solution for four days, afterward being dried. The ropes will thus have absorbed a certain quantity of sulphate of copper, which will preserve them from the attacks of animal parasites and from rot. The copper salt may be fixed in the fiber by a coating of tar or by soapy water. For tarring the rope it is better to pass it through a bath of boiled tar, hot, drawing it through a thimble to press back the excess of tar, and suspending it afterwards on a staging to dry and harden. In the second method, the rope is soaked in a solution of 100 grams of soap per liter of water. The copper soap thus formed in the fiber of the rope preserves it from rot even better than the tar, which acts mechanically to imprison the sulphate of copper, which is the real preservative. It is not stated whether the copper treatment is equally serviceable with dressed as with plain hemp ropes.

MECHANICAL GLASS BLOWING.—Messrs. Appert have devised a process, in their factory at Clichy, in which they use air stored under great pressure, so as to dispense altogether with the necessity of blowing by the mouth. Glass blowers are peculiarly susceptible to various disorders, such as diseases of the lips and cheeks, and predisposition to tumors and rupture. These affections are the more serious because boys are often employed when the eye is weakened by rapid growth. The high temperature and dry atmosphere increases the

unfavorable hygienic conditions. The new process entirely suppresses blowing by boys, and, with rare exceptions, by adults also. The manufacture of glassware is thus ameliorated by rapidity of execution, as well as by the perfection and the large size of the pieces which are produced.

ENGRAVING ON GLASS.—The hard point for inscribing and engraving rare stones is doubtless older than the lathe, and was certainly used in engraving glass during classical and medieval times. The Flemish, Dutch and Germans, within the last three centuries, used it with great success, as testified by examples of their work still remaining. Diamond or other hard stone point—or steel points similar to those used by some glass carvers of the present day—may be employed in engraving glass, and handled in the same way as ordinary gravers for metal or wood. The glass should be coated with a mixture of gum and milk, on which, when dry, a pattern may be drawn or transferred previous to engraving. Very fine line and hatching and stipple effects can be produced by this method. Some of the specimens in the Slade collection of the British Museum are exquisitely done, especially those attributed to Wolffe and Heemskerk. The great drawback to such engraving, when delicately finished, is that it cannot be well seen unless it is held close to the eye and in a good light.—*Art Journal*.

LASTING PROPERTIES OF CYPRESS.—Evidences are abundant and conclusive in regard to the lasting properties of this wood. Hence, it is gradually creeping into use more and more each year. Already it is being used in many houses in New York City in finishing, with calls for more. Five million shingles is the estimated amount of consumption in the New York market, with an increasing demand. At least 3,000,000 feet of the wood will be required to supply the market in railroad ties. It is exported to some extent to various ports. Railroad ties have been sent to Cuba, France and England. Lumber has been sent abroad, but in no great quantities.

PEWTER is made of tin four parts and lead one part.

GOOD MEALTH.

DROOPING SHOULDERS.—This is a serious evil. It comprises both appearance and vitality. A stooping figure is not only a familiar expression of weakness or old age, but it is, when caused by careless habits, a direct cause of contracted chest and defective breathing. Unless you rid yourself of this crook while at school, you will probably go bent to your grave. There is one good way to cure it. Shoulder-braces will not help. One needs, not an artificial substitute, but some means to develop the muscles whose duty it is to hold the head and shoulders erect. I know of but one bull's-eye shot. It is to carry a weight on the head. A sheepskin or other strong bag filled with twenty to eighty pounds of sand is a good weight. When engaged in your morning studies, either before or after breakfast, put this bag of sand on your head, hold your head erect, draw your chin close to your neck and walk slowly about the room, coming back, if you please, every minute or two to your book, or carrying the book as you walk. The muscles whose duty it is to hold the head and shoulders erect are hit, not with scattering shot, but with a rifle ball. The bones of the spine and the intervertebral substance will soon accommodate themselves to the new attitude. One year of daily practice with the bag, half an hour morning and evening, will give you a noble carriage, without interfering a moment with your studies. It would be very difficult to put into a paragraph more important instruction than this. Your respiration, voice and strength of spine, to say nothing of your appearance, will find a new departure in this cure of drooping shoulders.—*Dio Lewis*.

CATCHING COLD.—I have made a discovery which has proved invaluable to me, and I believe also to others to whom it has been imparted, and that has made catarrh to me very much less formidable than it used to be. The discovery is that all the most violent symptoms, the running at eyes and nose, sneezing, lassitude, weariness, and the thousand and one other distressing feelings that are included in the equipment of this well-known complaint, may be completely suppressed simply by abstaining from all liquid food and drink of every kind for a period varying, in my own case, from 24 to 50 hours, according to the violence of the symptoms. Take all the food dry, drink nothing, not even a cup of tea nor a spoonful of soup.—*Hall's Journal of Health*.

A NEW METHOD OF INTRODUCING MEDICINE INTO THE SYSTEM.—At a meeting of the French Academy of Medicine, held September 22d, M. Brondel read a paper on the introduction of certain medicines into the system by means of electricity. If the electric current is made to pass through a solution of a salt, the salt is decomposed, the metallic base passing to the negative pole, and the acid, or metalloid, to the positive pole. The iodides are easily decomposed by electricity. In order to introduce iodine into the system, a rubber plate, moistened with a solution of iodide of potas-

sium, is placed upon the surface of the body. Over this plate the negative pole of a battery is applied, while the positive pole is placed upon a part of the body toward which it is desired that the iodine travel. The iodine separates from the potassium, which remains at the negative pole, and passes with great rapidity through the tissues toward the positive pole. This may be demonstrated by testing with a starched paper, which becomes blue. A great number of substances can thus be made to traverse the tissues, and the applications of this discovery are numerous and important. M. Brondel has in this way cured uterine fibroids, a case of perimetritis, rheumatic ovarian neuralgia, and several cases of chronic rheumatism.—*Medical Progress*.

REMEDY FOR EARACHE.—We can recommend, from our personal experience, says the *Therapeutic Gazette*, an effectual means of administering chloroform in this complaint, and one which is absolutely devoid of danger. This is to loosely fill the bowl of a common clay pipe with cotton batting, upon which pour as much chloroform as it will retain without dripping. This done, insert the end of the stem carefully into the ear, and placing the opening of the bowl in the mouth blow gently the vapor of chloroform against the tympanum. We have found this to be an exceedingly effectual relief for earache of children, uncomplicated, of course, with inflammatory disturbances.—*Medical Times*.

DOCTORS MUST KEEP UP WITH THE TIMES.—A doctor was lately brought before the German tribunals for having neglected to keep himself informed as to the modern methods of practice. A servant who received a wound in the chest in April last died from septicemia under the care of this doctor, who, despising antiseptic dressings, treated his patient according to ancient usages. The court held that "every practitioner should keep himself informed in the accomplished progress of science, and have an exact knowledge of modern systems of treatment. If these had been employed the patient's life might have been saved, hence the liability for negligence."

BORAX AS AN INTERNAL DISINFECTANT.—In the *Union Medicale*, Dr. Cyon confirms the statement, made by Dumas in 1878, that borax is possessed of most valuable antiseptic powers. Independently of its value for the preservation of food, it is a great preventive of infectious diseases, and may be employed internally to ward off epidemics. It may be taken for months or years with impunity, and constitutes a valuable prophylactic. Dr. Cyon states that it is a remarkable fact that in all epidemics of cholera the workmen in boracic acid factories have always escaped the disease. The usual dose is five or six grams (75 to 90 grains) daily, taken for an indefinite time.

IRRITATION FROM RED FLANNEL.—The irritation from red flannel underclothing is not caused by the dye, as many suppose, but by the coarseness of the wool fiber of the goods. A belief is also very common that red flannel has some special value because of its color, but the belief is without foundation, and any other color where the flannel is of the same quality is equally efficacious. The red flannel selected is often, and perhaps generally, thick and heavy in texture, and consequently causes an irritation of the skin, for which the dye-stuff is by no means responsible. A softer flannel, or one made softer by wearing and washing, is what you need.

MEDICAL PLANTS IN BRAZIL.—Consul Wright of Santos, Brazil, encloses in a letter to the State Department notes upon the medicinal plants of that country. The compilation is the work of S. S. Schindler, a native-born citizen of the United States, who is now in Brazil. From Mr. Schindler's notes it appears that the country abounds in herbal remedies, and that aloe, the new cancer cure, is but one of hundreds of trees possessing properties of great value, as yet almost unknown to materia medica.

ERYSIPELAS has appeared in Nicolaus, Cottonwood, Vallejo, Truckee, Forest Hill, Santa Ana, Calico and Etna. As this disease may be classed among those of a contagious and inoculable character, every sanitary precaution ought to be taken to prevent its spread, as the poison of this disease is known to be one of the most resistant to the action of disinfectants, and capable of remaining active for a long period of time, even for years.

THREE LITTLE WICKS.—There are three little wicks to the lamp of man's life, brain, blood and breath. Press the brain a little, its light goes out, followed by both the others. Stop the heart a minute and out go all three of the wicks. Choke the air out of the lungs and presently the fluid ceases to supply the other centers of flame, and all is soon stagnation, cold and darkness.

SUDDEN SICKNESS.—In case of very sudden sickness, which often proves to be incipient pneumonia, a safe remedy is to apply a plaster of soap and Indian meal from the throat down below the bowels as soon as possible. If that does not give immediate and permanent relief, send for a physician, for unless relief is quickly obtained, there is danger of a speedy, fatal result.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GREEN ADEN.—Amador Ledger, Jan. 2d: This quartz claim, which is situated about a quarter of a mile south of the Pacific, has been sold to Ballard & Co., a wealthy company that last year conducted the extensive but unprofitable mining operations at Enterprise. We understand the terms of the purchase are that Aden, the owner, receives \$3000 in cash, and one-eighth of the stock unassessable; the company agree to spend \$150,000 within a stated time in developing the mine, otherwise the mine and whatever improvements may have been placed thereon, may revert to Aden. Active mining operations are to commence at an early date, under the direction H. Rees, of Sutter Creek, who has been engaged as superintendent. A cleanup comprising about 30 tons was made recently at the five-stamp mill of the St. Louis mine, near Pine Grove, which yielded \$14 to \$15 per ton.

SUTTER CREEK.—Ledger, Jan. 2: The repairing of the Eureka shaft is rapidly nearing completion. There is but 200 feet more to be done, when drifting in the direction of the old works will be prosecuted. A thorough cleanup was made at the Mahoney this week. The rock panned out slightly better than anticipated. The bullion has been sent below, and orders are expected daily for the extraction of the surface rock to be resumed. At the Lincoln, work is being actively prosecuted. Ten more stamps are being put in running order. The rock is being taken from the surface, and there is a large body of it, sufficient to run the mill to its present capacity for some time. The Amador sulphurets works closed a few days ago for lack of sulphurets. They will probably be idle for a couple of months.

RICH ROCK.—Amador Dispatch, Jan. 2d: Very rich rock still continues to be unearthed in the Moore and Amador Queen mines. In fact, the reports are encouraging from all the mines in that vicinity, especially at the St. Julien. The Zeile mill, hoisting works and reduction works will be lighted up with gas as soon as the necessary pipes and fixtures can be put in.

ROLLER MILL.—Amador Sentinel, Dec. 30: Lamb, Markstrom & Co. are putting up a roller mill at their mine near Enterprise, to cost \$750, and it is expected to be in working order in ten days. They have very good rock. Rock of extraordinary richness is reported discovered at the Shugert mine. A \$30,000 pocket is reported and pieces of gold as large as a hen's egg are in the rock, which is of a dark blue character.

Butte.

BIG BEND.—Butte Record, Jan. 2: The tunnel at Big Bend is encountering considerable water, as it approaches the slope of the mountain near the river. The quartz vein recently encountered by the tunnel, came near making a blockade by a cave. The lode is about five feet in width. Specimens of the ore have been sent to Buffalo to be assayed and tested. It is supposed to be the vein, pockets from which were worked by Peter Allis, who lost his life in the Marchella Ross Vendetta, and whose body was eaten by the wild hogs of the vicinity. If that supposition is correct it may prove a rich vein. It is expected the tunnel will be completed sometime the coming spring. The grade of the tunnel will strike the North Fork some three feet above the bed of that stream. Of course there will be an immense crowd present to see the water turned into the tunnel.

OLD MINES PAYING.—Cor. Butte Record, Jan. 2: The mining interest upon the creek is opening up finely, new discoveries being made, and old mines paying better. The last cleanup of Moss & Co's. claim paid well. For the labor performed it paid the best. May success attend their efforts. They have been a cash company, have expended many thousands of dollars which have been gathered up in the immediate vicinity of their works, and has been a benefit to our county. They are very careful of their debris, impounding all by heavy brush dams. Hedges & Weatherbee have a good claim, and are working the same, although at the present time at a disadvantage, owing to too much water. It is a ravine claim, and as soon as the water runs down all will be prosperous.

Calaveras.

NEW MILL.—Calaveras Chronicle, Jan. 2: We learn that the new stamp mill being erected at the Fine Gold mine by Haggin & Kervin is well on towards completion, and that in about three weeks' time it will be thundering away on the best kind of quartz. The mine has improved both in richness of ore and width of ledge as depth has been attained. We hear that the Cook Brothers' mine sale is in a muddle. The purchasers demand an extension of time from the Cooks, which they refuse to give. The outcome of this Cook imbroglio will undoubtedly be all right. The contract expired yesterday, and as the money was not paid to the Cooks the mine reverts to them. The mine is good, and a new deal will be made with some of the old bondholders, who, we understand, are ready and willing to "stay with the mine."

MURPHYS.—Citizen, Jan. 2: The Oro Plata mill starts up under the most favorable auspices, and there can be no doubt that it will not carry out the fullest expectation of those sanguine of its successful working. We predict a long and successful run with large bullion shipments. The other mines in the vicinity are progressing favorably, with good reports from various quarters. A number of mining men have been among us of late, and they were favorably impressed with the mines they examined.

Colusa.

BIG STRIKES.—Denver Republican, Jan. 1: The talk in the hotel lobbies and among mining men generally, is concerning the rich strike in the Henrietta and Maid-of-Erin mines in Leadville. Information received in Denver yesterday stated that the ore body had now been penetrated to a depth of thirty-six feet, and still there is no bottom. The character of the ore body has changed from sand carbonates to a hard substance, however, and the belief is that as soon as this formation is passed through, the depth of the ore body will be disclosed. The ore grows richer as depth is attained. For the

first 20 feet the ore was sand carbonates, carrying 45 per cent lead and 10 ounces silver. For the next 10 feet the character of the ore was the same, only it was richer, carrying 55 per cent lead and 15 ounces in silver. For the last few feet it required blasting to remove the ore, and it is still richer in silver and about the same per cent in lead.

Fresno.

A NEW CAMP.—Fresno Expositor, Jan. 1: West of the Grub Gulch mines in Fresno county a new mining district was organized at a meeting held on the 15th of December at Knoblock's ranch. James B. Baker acted as Chairman and John T. Young Secretary of the meeting. The district is called Fresno mining district, and is bounded as follows: Commencing at a point on Fine Gold, opposite the residence of Frank Walker; thence running westerly to a point on Coarse Gold creek, to a point near or opposite the residence of Peter Johnson; thence down Coarse Gold creek to its intersection with Fresno river; thence down Fresno river to Still's ranch; thence in a southeasterly direction to the bridge on the San Joaquin river; thence up the San Joaquin river to the mouth of Fine Gold; thence up Fine Gold creek to the point of beginning. John T. Young was elected Recorder of the district, and a code of laws was adopted.

Inyo.

PLEASED MINERS.—Inyo Independent, Jan. 2: The proprietors of the White Hill mine are well pleased with the returns from their last shipment of ore. The amount shipped was 42,275 pounds net. It contained 81.67 ounces silver per ton, and 70.25 per cent lead. For the silver they received \$1.02½ per ounce, and for the lead \$4.60 per hundred pounds. Gross value of the ore per ton, \$124.94; less charges \$20; net value of ore per ton, \$104.94. Total value of ore, \$2005.16. The owners of the mine, Alexander, Kehoe and Barnes, are working miners. All the help they employ in their mine is one man occasionally, nearly every dollar of the above sum has been divided among the three men, and the whole of it was earned in a few weeks. The mine is now looking as well as ever it did, and another shipment as valuable as the last will be made before long. The Inyo mountains offer a most promising field to industrious and intelligent miners.

NOT SATISFACTORY.—Inyo Register, Jan. 1: Robt. Love had some ten tons of ore from the old Piute mine worked at the Maxim mill by way of a test, as it was known to be too base to give much hope of a margin for profit by the plate process alone, although it assayed so high it was deemed best to try it, for there are hundreds of tons on the dump and in sight. It barely paid milling expenses, so some other process will be tried, for it is a big mine, and the ore seems to be quite rich.

Mariposa.

DILTZ.—Mariposa Gazette, Jan. 2: Operations on the north side of this mine have been commenced and with an increase of water from the last rain the large embankment is being washed through a ground sluice, which uncovers a vast amount of float quartz rock that will pay to mill. Work has also been continued in the large open cut on the south side, which shows a vein and vein matter over 40 feet wide. Several slides in the hill have occurred, some of which have covered up two or three shafts on the main vein.

FRANCIS MINE.—Mariposa Gazette, Jan. 2: This mine, which was started up several months ago under the auspices of Messrs. Chodzki & Bourdage, late of the Quartz Mountain mine of Fresno county, is likely to prove a success and become one of the permanent mining properties of a profitable kind of the county. A sufficient test has been made by the proprietors to satisfy them that there is plenty of paying ore to justify permanent improvements upon the mine. Since the completion and starting up of their ro-stamp mill by steam power, they have ascertained that a water power could have by opening up and deepening an old ditch some three or four miles long to Mariposa creek, formerly constructed and used by the original founders of the mining property. It has been ascertained that sufficient water can be had to turn an overshot wheel at least six months in a year, which will make a saving of \$20 a day and upwards from the present mode of using steam power. The works at the mine and mill have been suspended for a time with a view to this important change. The new ditch is about completed, and the material for a waterwheel and fixtures is on its way from San Francisco.

Nevada.

A GLANCE AT THE MINES.—Foothill Tidings, Dec. 31: Mining is going steadily and surely ahead in this district, and out of the numerous prospects now in operation here, we are almost sure to get two or three dividend paying mines, which will afford employment to a great number of miners.

THE CROWN POINT MINE.—Owned solely by A. Gauthier, is being steadily worked and there is no particular change in the quality or quantity of the ore. Several rumors are current that the mine has been sold for \$300,000, but there is no truth in the report. The Triumph concentrators have been placed in the mill at the Crown Point and are doing effective work in saving the very rich sulphurets which comes from the ore in abundance. The ledge is over three feet in width and averages about 13 per ton, with now and then a washub full of specimen ore. It is the intention of the owner of the mine to enlarge the mill during the coming summer.

THE BOSTON.—Now working on the old Granite Hill ledge, situated on the eastern bank of Wolf creek, and at one time owned by Martin Ford & Co., is doing well, and has most flattering prospects for its future. A company of twelve men have leased this property for a period of two years and a half, and have opened the mine to a depth of 230 feet on an incline, and have erected pumping machinery, run by water power, on the property. The north and south drift in the Boston are each in 60 feet. The size of the ledge in these drifts varies from 6 to 8 inches. The first crushing taken out by the present lessees paid \$25 per load, and shortly after a crushing of 35 loads paid \$72 per load, while the last crushing, 27 loads, which was completed but a few days since, gave a yield of \$70 per load. The present lessees of the mine will purchase the property, and will pay for it with the money taken from the mine; and the owners will all be residents of Grass Valley.

THE PHOENIX MINE.—Located on Osborne hill, promises to come to the front as a dividend payer, and that too in the near future. The shaft is now

down 85 feet below level No. 1, and shows a 12-inch ledge, with free gold and plenty of sulphurets. The miners have now commenced cutting a station at the bottom of the shaft, and at the end of the week drifting will be commenced on the chute. A crushing of 30 loads of ore has just been cleaned up and the sum taken from it was \$1000, the sulphurets not yet having been worked. This rock was crushed by the tributers, who took it out on half shares and it paid them, on those terms, \$3 per day. The ledge is from one to four feet in thickness and is in good ground. The Phoenix has decided to stop the tributers' crushing came from, until the mill for the company is built, which will be early in the spring. The southwest drift in the Phoenix is now in 40 feet, and has a six inch ledge of good ore.

The Coe mine, lately the property of Hon. E. W. Roberts, was sold to-day by a party of Grass Valley, ans, who will commence work upon it as soon as possible. The shaft on this mine is down 500 feet; the rock has been sufficiently tested to disclose its qualities, and gives promise of paying good profits. Messrs. George Murphy, A. D. West and other enterprising citizens are the purchasers of the Coe, having paid \$5000 for it. The Horseshoe company have just let a contract for sinking their shaft 100 feet deeper. The shaft is now down 140 feet, and the ledge is a good one in appearance. The contractors who have lately been working on the Horseshoe have about six tons of ore on the dump, which will soon be put through one of the custom mills. The Empire mine, the oldest in the district, is now taking out pay ore from the eight, 10, 11 and 15 levels. The shaft is being sunk for the 1600-foot level, and in addition to the 20 stamps already employed in the mill, 20 stamps more are being added. The Idaho is the same old story. On Monday next it will pay its 15th dividend. They are now sinking for the 1700 level. The lower levels in the mine are good.

The Lone Tree is being steadily worked, and, although a mere prospect, the owners have the utmost confidence in its future as a paying mine. The Magneta mine has just completed its new hoisting works. The shaft is down 400 feet, and will be sunk by contract 200 feet deeper. The North Star paid at its last crushing, \$60 per load in free gold, without counting the sulphurets, which pay \$60 per ton. The company is sinking on the ledge.

CROWN POINT MINE SOLD.—Nevada Transcript, Jan. 5: It was reported here yesterday that the Crown Point quartz mine at Grass Valley had been sold to an English company by Mons. Gauthier for \$300,000. The first installment of the purchase money was paid yesterday, Mr. Gauthier and the agent of the buyers coming to the county seat to close the negotiations.

BADGER HILL MINE.—Grass Valley Union, Jan. 2: The Badger Hill Mining Company has definitely determined to start up work on the mine as early in the spring months as practicable, which will be about the month of April. New hoisting works will be erected, and the machinery will be strong and capable of working the mine to a considerable depth. Estimates are being made as to the cost of introducing water power, which is preferred to steam if the power is obtainable on favorable terms. No doubt is felt that the Badger will open up a good mine, and the company will have a working fund that will insure a thorough exploitation of the ground.

Placer.

MAYFLOWER.—Placer Argus, Dec. 31: F. Chappell, superintendent of the Mayflower and Live Oak mines at Forest Hill, was in Auburn Tuesday on his way to San Francisco to attend a meeting of the directors of the Live Oak Company. He reports things as prosperous at the mines. The Live Oak is prospecting very favorably, and the owners and all concerned are elated.

IOWA HILL DIVIDE.—Cor. Placer Republican, Jan. 1: Good news is being received from our drift mines, notable among which is the Watts, where they have cleaned up some ten ounces more in the last week's run than they have done in the same length of time before, and still some more in sight. McIntyre is opening up his claim, and is very much encouraged with the indications. It is true the Succor Flat men are off. There are those among us who think they can make the old claim pay yet, but not with fancy salaries, etc. Report has it that the Golden River Company have determined to enter into mining on an extensive scale, they having bonded a large lot of mining ground above Damascus, as well as the Mountain Gate mine. Experts have been engaged for several weeks in the latter named mine to locate, if possible, where the pay gravel came from and whither it went. I refer to that part of the rich gravel that the Mountain Gate Company did not get, as where they are taking out pay at present does not look like an outlet. Parties connected with the Morning Star inform me that within the last two months their ground is looking better than it has for several years, more of a permanent character; the company is preparing to open up in good shape ere long. Hoorman & Co., who have been driving a bed-rock tunnel for eighteen months, have not succeeded to date in finding the expected rich lead, though Captain H. was very sanguine he knew exactly where to go for it. The China, below the last named mine, are finding very rich cemented gravel. They are forced to use powder. The Vigilance Company on Grizzly Flat, are extending their tunnel into the main hill and have struck pay gravel. Hazlethorn, on the opposite side of the canyon, who has been looking for pay, has at last come on to a body of gravel that paid over wages for the last two weeks. Gas has been very patient, and we hope he may get it good. The Lebanon Co., at Prospect Hill, is making another effort to find the lead. Rich gravel was found some years ago, but it gave out. They have commenced in what they call the upper channel, which is a singular formation, there being depressions in the country rock that seem to run in every direction, without any regard to the trend or grain of the same.

IOWA HILL DIVIDE.—Cor. Placer Republican, Jan. 1: There is not one hydraulic mine running on this divide at present, and it is evident that this character of mining is a thing of the past in this part of the country. The mines of Iowa hill, Forest hill, Michigan Bluff, Yankee Jim's and Todd's valley are entirely worked out as hydraulic propositions. Ditch property, in consequence, is rapidly depreciating in value, and will soon become almost worthless, except as a means of furnishing power. But while hydraulic mining is being discontinued, drift mining is being

energetically prosecuted. Work goes steadily on in the old drift mines, and many new tunnels are being driven in mines heretofore worked by the hydraulic process. The Morning Star, Golden Gate and Homeward Bound mines have quit as hydraulic properties, and drifting for the rich channels is being vigorously pushed by all three of them. Very fine developments have recently been made. The Morning Star mine, about 3000 feet in from the mouth of the tunnel. A large area of rich gravel has been blocked out, and it is the intention of this company to prosecute the work with energy. Bowie, the owner of the Homeward Bound, was here last week, looking after the affairs of his mine. His men are also driving a tunnel, and expect soon to strike pay gravel. The Golden Gate, under the management of Mr. Bowley, has turned out some rich gravel and many fine specimens during the year, one nugget worth \$230. Drifting is being continued, and considerable gravel is now on the dump. J. B. Hobson has a gang of men at work on his Blue Wing mine cleaning up bedrock, which was stripped a year or two since. He is also running a bedrock tunnel, intending to work the mine by the drifting process hereafter. The Chinese owners of the Union mine adjoining are not washing; the large body of pipe clay overlying their gravel, makes it unprofitable to hydraulic. They intend to soon commence drifting. The Watt brothers' drift mine, near Monoma Town is being steadily worked, and continues to pay handsome dividends to its fortunate owners. Drifting continues at the Harmon mine, at Wisconsin hill, and I learn that James Gleeson is contemplating the opening of a fine tunnel in the Columbia claim in the same locality. The deep gravel at Wisconsin hill is known to be very rich, and big results are expected. Gold-bearing gravel has been struck on the edge of a channel in the McIntire mine, above Giant Gap, and the owner, Mr. McIntire, is pushing the work with his characteristic energy. The Mountain Gate mine, at Damascus, has about 25 men at work, who are taking out gravel that yields \$3 a carload. This is considered one of the most valuable properties on the Divide. The Golden Fleece people have already struck gravel and an immense channel of over 1000 feet wide has been discovered. The present tunnel is found to be too high. Another lower tunnel will be started in the spring, to make it practicable to work the lower strata of pay gravel, and to drain the mine. At the Hog's Back mine, next east of the Golden Fleece, they have broken through the rim and found pay gravel, pitching off towards the channel. An immense flow of water drove the men from the tunnel, and another tunnel will have to be driven. The Bob Lewis mine, adjoining the Mountain Gate, is raking out gravel which pays from \$10 to \$12 a carload.

THE HOTALING IRON FURNACE.—A Hotaling correspondent of the Auburn Argus says: The furnace of the California Iron and Steel Co. will be in operation again soon, probably within the week. A number of hands are presently employed upon the great furnace, fitting up water-pipes, etc. Some 5000 tons of good-looking ore are on hand ready for smelting. Mr. T. B. Berry, the superintendent, anticipates a long and favorable run when the works are started up. Mr. William Gerhauser, who returned Saturday from a five-weeks' trip to Baltimore, brought with him from Maryland an experienced coal-burner and also a night foundryman. James Richards, foreman of the mine, has 23 men at work in shaft No. 2, where two Burleigh drills are kept running constantly. The shaft is 136 feet deep to the present workings. The ore in the north and south crosscuts is abundant and of good quality. During the late heavy rains the water broke into the north drift, and it has been found necessary to put in pumps to get rid of it. When the water shall be got out, an upraise will be started to open stopes for the greater facility of taking out ore. About 2000 tons have been obtained from No. 2 shaft during a few months.

Shasta.

MILL AND MINE.—Shasta Co. Democrat, Dec. 30: Andy Life has leased the mill at Lower Springs, and has commenced crushing his ore. Two new gold quartz strikes are reported to have been made on Squaw creek this week. Thomas McDonald, of Deadwood, went below yesterday morning, with a gold brick weighing nearly fifty pounds. A full force of men are at work in the Hardscrabble mine, at Igo, and a large quantity of dirt is moved daily. Geo. McDaniels is making fair wages on Irish gulch at ground sluicing and washing with a rocker. In early days this gulch was enormously rich. Another rich strike was made a few days ago on Squaw creek by two prospectors whose names we fail to recollect. The new find is to the northeast of Warner & Lowden's claim. A company of Red Bluffers are developing a fine prospect west of Redding, near Irish gulch. They have struck ore at a depth of 40 feet. It is thought to be a continuation of the tellurium lead. Forbes & Co. are running a tunnel on their claim west of Dan O'Neals, that will tap a rich ore chute about 110 feet deep. The boys have made their prospect pay its way so far, and they have fine prospects ahead. Whitton, Bassett & Stocks, proprietors of the Lilian Maude and Carrie Huston mines on Squaw creek, sent an order yesterday to Sacramento for a quartz mill, which they will endeavor to put up on the ground within 90 days. They have commenced erecting a mill house. Col. Stocks says the mill is a new invention, and claims that it is pronounced by experienced mining men to be the best ore crusher made. Jake Hudson and a partner are developing a mine near Alabama gulch—about two miles up the river from Reid's Ferry, opposite Middle creek—which promises to be a bonanza. They are now down about 25 feet, and are taking out ore, not only rich in free gold, but also in sulphurets. Near the surface the rock assays from \$11 up into the hundreds, and the ore has steadily improved as depth is attained. At present developments they feel that they have a rich mine, and it would not be surprising that if, sooner or later, they should strike a rich tellurium deposit. Simonds and Barnes have made four locations on Squaw creek, that as grass-root prospects promise to be as big mining property as there is in the county—the Lost Confidence or Balakalla not excepted. The new discovery is on the east side of Squaw creek, but on the same belt that those mines are located on. The surface ore is a genuine counterpart of the Lost Confidence and Balakalla, and assays from \$10 to \$165 in gold, and from \$3 to \$10 in silver. There seems to be an immense body of ore, and miners who have seen it say the extent of the ore body in sight is much greater than that of either the two mines above

mentioned. Another thing greatly in its favor is location and accessibility.

FRENCH GULCH.—Cor. Redding *Free Press*, Jan. 2: As for the mines most of them have made good cleanups. The Scorpion, owned by Gannon & Co., have just made a run of 250 tons or more, with a result of about \$6000. The Niagara mill is running on full time. The Washington mill has been running most of the time; also the Brunswick mill. McDonald & Franck, on Deadwood cleaned up on the 24th a good chunk of fifteen thousand. Watt & Co. have a good mine. Gibson Bros. are running their mill on good rock, and the other mines are doing well.

San Diego.

JULIAN.—San Diego *Union*, Jan. 1: Very flattering reports are being received respecting mining matters at Julian. The owners of the Owens mine are now in San Francisco buying machinery. They propose putting up a mill with a capacity of twenty stamps. The shaft of this mine is down 150 feet. They have drifted in fifty feet in one direction and have got a 100-foot ledge from three to five feet in thickness which shows free gold all through it. Robert Gardner is taking out rich ore from the Blue Hill mine. A large body of fine ore has been struck in the old Golden Rule ledge just below the Blue Hill, owned by Hanson & Sandeman. Preparations are making to reopen the old Golden Chariot mine, said to be one of the richest lodes ever discovered. In fact the mines all along the belt from Julian to Banner are being worked now, and there seems to be a revival of the mining excitement of former days. Work on the Shenandoah was resumed about two weeks ago and it is yielding well. A quantity of bullion from this mine was received at the Consolidated National Bank yesterday.

Sierra.

THE PHOENIX MINE.—Sierra *Tribune*, Jan. 1: Mr. A. C. Busch returned from San Francisco last week, where he had been for the purpose of making definite arrangements with a party of capitalists for the future working of the Phoenix mine. We are pleased to state that he succeeded in getting everything in satisfactory shape, and that there is nothing now in the way to prevent the parties from carrying out the extensive operations on this property, which they have in view. The San Francisco people displayed their good judgment by unanimously electing Mr. Busch Superintendent and General Manager of the mine.

BALD MT. EXTENSION.—Mt. *Messenger*, Jan. 2: At the annual meeting of the Bald Mt. Extension Co., Saturday Dec. 26th, held in Downville, the old Board of Directors—H. T. Briggs, S. B. Davidson, J. W. Orear, Robt. Forbes and H. H. Purdy—were re-elected for the ensuing year. After the adjournment of the stockholders' meeting the Board met, re-elected H. T. Briggs President, and declared a New Year dividend of ten cents a share, aggregating \$6000, payable Jan 1st at Scamman's bank, Downville. The lead at the Extension mine, Forest City, is 260 feet wide, and the gravel from the latest upraise, near the face of the main tunnel, averaged over \$5 a load.

NEVADA.

Washoe District.

GOULD AND CURRY.—Enterprise, Jan. 1: On the 1000 level, west crosscut No. 2 is now in 215 feet. Face in dry vein porphyry, quartz and clay. In the 600 level, the joint station with the Best and Belcher is being repaired, and the west drift therefrom cleaned out and retimbered, a distance of over 100 feet. This reopening is intended for ore explorations at that level. The pumps at the Osbiston shaft are to be started into operation directly. There is about 500 feet of water in the shaft, the surface of it being at the 2000 station, not the 500, as our evening contemporary has it, therefore it will not take long to pump it out, when the shaft is to be sunk to a level corresponding with the 3200 level of the Combination shaft, with which connection will then be made by means of lateral drifts from both ways.

HALE AND NORCROSS.—Exploration work is suspended in the upraise in the good ore body, above the deep winze station, on the 3000 level. This is, by reason of not being able to remove the ore and waste extracted on account of the hoisting facilities of the Combination shaft being fully occupied and employed in sinking the shaft deeper. On the 3000 level, the main lateral drift north is being steadily advanced in very promising vein matter. It has reached the end of the diamond drill hole, and is within 70 feet of the Savage line. No water is encountered as yet; in fact, the diamond drill has been again inserted and is being run ahead from the face of this drift, in order to guard against any possible damages from some unexpected flood.

CON, CALIFORNIA AND VIRGINIA.—On the 1750 level, the ore breasts and stopes are holding out well, yielding about 125 tons per day, of the average assay value of \$16.50 per ton. The northwest drift on the 1600 level, making good progress toward the old bonanza workings. Ore has been tumbled out pretty lively from the Jones lease section, above the 1500 level, during the week, over 200 tons per day, as the lease becomes entirely defunct at the close of this year. This ore gives an average assay of about \$22 per ton.

OPHR.—West crosscut No. 3 from the main south drift, on the 400 level, is being steadily advanced toward the west wall, with no new features to mention. The repairs to the station at the main shaft on the 700 level, being made jointly with the Mexican and Union Consolidated companies are progressing well, and the drift to the northwest is getting started toward the ground of these two last mentioned companies for ore exploration purposes.

CROWN POINT.—From this mine and the Belcher 400 tons daily continue to be shipped to the mill. Owing to the winze connection recently completed between the 1600 and 1700 levels giving better air and facilities for extraction, more ore is being taken from the breasts in the vein at the latter point. This is of better quality than that from the old upper workings like that which comes from the Belcher.

CHOLLAR.—Nothing whatever is being done on the 3100 level, the drain boxes being fully laid throughout the main south lateral drift and properly covered in so as to carry off both the hot water and the steam. Work is concentrated in the sinking of the Combination shaft deeper, or to the 3200 level,

YELLOW JACKET.—Ore extraction from the old upper workings goes steadily ahead, supplying the Brunswick mill. There is plenty of low-grade ore in sight, but the best is being selected, as much of it is too low grade for any present use. Nothing new in the explorations on the 1700 level.

COMET.—From this old mine, on the west side of American ravine, Sirlott and West, of Silver City, are extracting some pretty good ore, the vein being two or three feet in width. It is being reduced at the Thompson mill, Lower Gold Hill.

SIERRA NEVADA.—The main north lateral drift on the 520 level makes steady progress in very favorably working vein matter, consisting of soft vein porphyry, with a little less quartz and clay than heretofore encountered.

KENTUCK.—Owing to milling repairs, etc., the ore yield has fallen off somewhat lately, but the stopes and breasts of the old upper workings are looking and holding out well.

ALTA.—The lateral drift north toward the Benton ground on the 700 level goes ahead as usual in promising vein matter, with streaks and bunches of low-grade ore.

UNION CONSOLIDATED.—The crosscut east on the 500 level, 100 feet south of the Sierra Nevada line is making steady advancement in vein porphyry, quartz and clay.

MEXICAN.—The lateral drift north from the east crosscut is being steadily advanced at the rate of about 40 feet per week in very favorable vein material.

BEST AND BELCHER.—West crosscut No. 3 still continues in favorable vein material and makes good advancement.

MONTE CRISTO.—Ore enough is being extracted to keep the mill steadily running.

Columbus District.

HOLMES.—Candelaria *True Fissure*, Jan. 2: In the cross developments we have 4 feet of good ore. This is the extreme eastern ore body in the mine. It is good ore, and looks like it will be continuous. We have at a point about 60 feet west of Cross development a good prospect, but it is not sufficiently developed to enable us to judge of its value. At point 18 we are still driving the drift.

MOUNT DIABLO.—The east drift from the north crosscut on the 4th level is in 50 feet and shows 2 feet of \$40 ore. The intermediate drifts from the winze below the east drift on the 4th level both show a little ore of fair grade. The east drift from the No. 7 winze is in 170 feet and shows a small streak of good ore.

POTOSI.—The lessees shipped two carloads of ore to San Francisco during the week. They expect to make another shipment of two cars in a few days. The mine looks about the same as at last report.

CLIMAX.—The tunnel has been driven 20 feet since last report. The face is in extremely hard ground, but it is hoped that it will change for the better soon.

GENERAL GRANT.—The ore is improving as we go down on the ledge. We have just got through an iron horse and the ledge is making into chloride very fast.

Eureka District.

ORE SHIPMENTS.—Sentinel, Dec. 31: During the ten days ending yesterday ore shipments were made from the mines of the district to the two reduction works in town as follows: To the Richmond works—Hamburg mine, 55 tons; Mimbre, 20; Silver Lick, 44; Rosalind, 1; Phoenix, 28; Jersey, 15; Lemon, 2½; Frazier & Molino, 19; Bay State, 8; Friday, 3; Grant, 11; Jackson, 28; Republic 3, and Lone Pine, 6. To the Eureka Con. works—Lord Byron mine, 2½ tons; Mayflower, 1½; Dunderberg, 35½; Marguerita, 7½; Enterprise, 2½; Hope, 1; and Irish Ambassador 8.

Esmeralda District.

AURORA.—Cor. Bodie *Free Press*: On Tuesday last, representing the Con. Esmeralda (limited) Company, arrived in Aurora, assistant superintendent Geo. Mills, civil engineer P. Mackay and foreman Harry Newton. Accompanying those gentlemen was Mr. Anderson, formerly of Bodie, who, it is understood, will at once begin surveying all the unpatented properties transferred by the late sale. It is learned that the operations of the company will, during the winter, be confined to the development of the Humboldt Con., on which undoubtedly a force of men will soon be put to work to pave the way for its first introduction to hoisting machinery, and to the development of the Aurora Con. by extending the tunnel—called the middle hill tunnel—sufficiently to cut all the veins belonging especially to that group.

AURORA.—Bodie *Miner*, Dec. 31: The sale of property at Aurora to the English company of capitalists embraces forty-two mines located on the different hills around that camp. It is not believed that the new company will commence anything like vigorous work at present. A few prospectors will probably be put on; but it will take until spring to properly perfect the plans for a thorough system of mining. Hence, although we are firmly convinced that Aurora is to become a prosperous little mining camp, it is no place to rush to just at present, with a view to business. We have it, also, but not on positive authority, that the sale embraces our railroad and the sawmills and timber tract at Mono lake, and that a branch railroad will be run into Aurora in the spring. One thing is certain, while we do not believe that the new company at Aurora propose to throw their money away, we do believe that they are shrewd and sagacious enough to make their money make money.

Tucacora District.

NORTH BELLE ISLE.—Times-Review, Jan. 2: Fair progress has been made with the work on the 150-foot level.

GRAND PRIZE.—Intermediate above 300 extended 18 feet, 200 level 12 feet, and crosscut on 200 level 14 feet.

NAVAJO.—North drift on east vein No. 2, 150 foot level, has been extended 8 feet during the past week. Have suspended work in the south drift east vein same level.

Victoria District.

GRUB STAKING.—Carson *Appeal*, Dec. 31: W. H. Burns, of this city, about a month ago purchased a good mine in the Victoria district, at Schurz, near Hawthorne. The purchase was made of Dudley and Walcott, and since the transfer, a suit has been

brought by a man named Swart, against Dudley and Walcott, who demands a third interest on the grounds that he furnished the original grub stake for the locators, and the locators never settled for the same. The ledge is fourteen inches wide and assays about \$2000 a ton, promising to become a very valuable property.

Ward District.

DESERTED.—White Pine *News*, Dec. 30: We made a hasty visit to Ward Tuesday. The old town looks almost deserted, and, to one who was there ten years ago—in the heyday of its glory—its present appearance would bring a sigh of regret for its departed glory. Of all the business houses that once adorned its street, but one remains, that of Poujade & Garaghan. Many of the buildings on Main street have been moved away, and those that remain are fast going to decay. Some four or five families still remain. Mr. Culver, Superintendent of the Martin White, is working six men on a southeast drift from the tunnel, and a few others are working a lease in another part of the mine. The mill, too, is being put in repair, and with the ore now on hand, and what is expected to be taken out, quite a run will be made in the spring. The old tailings will also probably be worked, which may give the old camp quite a prosperous season next summer.

ARIZONA.

GLOBE.—Silver *Belt*, Dec. 31: A very considerable amount of development work is being done now throughout this district. Inasmuch as the work being performed in the development of the vast resources of our most wonderful mining section here is being done by the miners themselves, without the aid of capital, and by those who, though scant of means, are steadfast in their faith in the final outcome of our camp, it certainly makes their efforts in this direction more worthy of special notice.

RICHMOND BASIN.—The West Richmond is being steadily worked by Messrs. Lowther and Woodson with results highly satisfactory to the owners. The La Plata is being worked by S. R. Sands and Cadman on a lease, and is yielding some good ore. The Mack Morris is also being worked on a lease by Hatch & Co. The Helen is leased to Uncle John Epley, who is taking out some splendid ore. The Davy Crockett mine, near the Cox & Coplin, is being constantly worked by the owners, Billings, McNelly & Co., who are taking out a large amount of ore, that will run up into the hundreds of dollars per ton. The Old Columbia mine near the above is turning out some rich ore for its owners, who have just made a shipment to Socorro, which they claim will run about \$2000 per ton. They are extracting, I am informed, a large amount of ore from the "Crank" near the Irene, about 45 tons of which has been shipped to the Miami mill for reduction. This mine is owned by J. D. McCabe and M. Whalen, but is being worked by J. C. Coplin & Co. under a lease. The assessment work for the year 1885 has been performed on the Pinal and Aztec mines, which belong to the estate of the late C. T. Mills, of Brooklyn, California. The former has a shaft 40 feet in depth that shows a vein four feet wide, which carries a carbonate ore of a good grade. One lot was milled some time since, at the Miami, that yielded 206 ounces of silver per ton. The Aztec, also, is a very promising property. The recent work on this claim uncovered a new vein four feet wide, carrying a most excellent grade of carbonate copper ore.

A PROSPECTIVE BOOM FOR SIGNAL.—Mohave *Miner*, Jan. 2: On Tuesday of last week Mr. Hugo Richards, of Prescott, passed through Kingman on his way to Signal. This gentleman has furnished most of the capital used in prospecting the Signal mine during the past year. This mine, together with the old and well-known McCracken mine adjoining it, were located about the year 1872, and a vast amount of work has been done on them at different times since, and three mills have been put up to work the ore. The McCracken is a 20-stamp mill and is now in first-class order, being ready to start up at a minute's notice. The Signal mill contained ten stamps, but ran only a short time until it was destroyed by fire. Through the efforts of Mr. Richards this mill is now being rebuilt, all of the lumber and material necessary for so doing being already on the ground. During the past year eight or ten miners have been working steadily on the Signal mine, and have found and developed a large vein of high-grade ore. The owners claim that there is already enough ore on the dump and in sight in the mine to keep the mill running for a year. We are informed that Mr. Richards will superintend all future operations in person. According to the present outlook it will be only two or three months before bullion shipments will again be made from the town of Signal.

COLORADO.

ITCH.—Tribune *Republican*, Jan. 1: The C. H. C. mine, operated during the past few months by Messrs. Watkins and James (manager and metallurgist respectively of the Pasadena Smelting Company) under lease, now carries thirty-six names on its payroll. This is the largest force on any mine here. The Princeton mine adjoining has a force of fifteen to twenty men. The Leila Davis, the Little Maggie, the Forest, the Hooe and Cross, and one or two others employ each about fourteen men. The Newman group is being operated by eight or nine different lessees, who employ collectively about fifty men. Adjacent to these mines is the Golden Age, which is undergoing constant development, as Judge Julius Thompson and Mr. A. A. Waggoner, the owners have had a force of half a dozen men at work there ever since last spring, and have taken out some high-grade ore. I was about to state that the greatest activity at present prevails on C. H. C. hill, but on reflection I find that Newman hill is as lively, that Nigger Baby hill is being actively developed, and that the eastern portion of Dolores mountain is the old stand-by, where the Leila Davis, the Little Maggie, the Black Hawk, the Corsair Chief, the Forest and several others have established a little village of boarding and bunk houses, assay shops and offices.

The Grand View Smelter is in full blast and will continue to reduce twenty-eight to thirty tons daily during the winter season. Not over two years ago the charges at these works were from \$30 to \$40 per ton. Now they are not half so excessive, and still are in excess of what they should be. Most of the ores carry a percentage of lead. At the railroad points lead is paid for at the rate of 50 cents per

unit. Here but 20 cents is allowed and nothing for the first 10 per cent. Mr. Grierson, the Superintendent, and Mr. Bryan, the metallurgist, claim, with justice, that the cost of freight base bullion to Rockwood makes this reduction necessary. But these unfavorable circumstances and measures work a hardship to the producer, though it gives employment to the freighter. The bulk of Rico's ore is low grade. Thrice the amount of ore now shipped to the smelter goes over the dumps or is stored in expectation of relief by means of a railroad.

IDAHO.

SMOKY.—Wood River *Miner*, Dec. 30: George Montgomery, who has spent the last month in Smoky, says that that region can be safely reckoned on for regular daily shipments of 20 to 30 tons, after the first of next June. Until then the shipments will be somewhat irregular, but one will come in right along, even this winter. A carload of ore is now on the way in from the King of the West, and more will follow—so that by the 15th of January he expects the most of the purchase price to have been realized from the mine. The Trade Dollar, which is located about half a mile from the King of the West, is showing eight to twelve feet of first-class concentrating ore, and Mr. Montgomery considers it the best mine in this section to-day. Its vein is massive, regular, and of uniform value. One-half of the Trade Dollar was recently purchased by Mr. Montgomery and his partner, Mr. Woodward, for \$3200. The purchase was made about three weeks ago, immediately after five feet of ore was cut into. The week before the one-half interest was offered for \$250 worth of supplies. Now a cool \$20,000 would not get it. So it is in mining.

MONTANA.

GOOD VEIN.—Helena *Independent*, Jan. 1: The Alpha and Omega received good news from their mine to-day. While sinking in the main 150-foot level, they struck a three-and-a-half foot vein of ore panning out \$60 to the ton. Work on the mill is progressing finely, and the stamps will be ready to drop in about two weeks. We understand that the Badger mine has been bonded by parties in this city for \$35,000. It is between and adjoins the Alpha and Batchelor. The Assiniboine received a few days ago another nice lot of ore from tunnel No. 2. It assays 41 ounces silver and \$28 gold, and runs 25 per cent lead, a very fine showing, as the tunnel is underground less than twenty feet. They have on the dump a considerable quantity of good ore, and expect to begin shipping soon. They had a bid to-day of \$46 per ton for their ore. They expect the mine to pay its own way from this time on, and soon show a profit. The vein is widening and growing richer as they gain depth.

NEW MEXICO.

ORE.—Socorro *Bulletin*, Jan. 2: F. H. Zeigler is dumping good ore out of his Index mine. Hite and Dahle are taking pay mineral out of their Moorehead mine. H. W. Russell is working the Marsh mine in the Pueblo district, and is raising good carbonate and galena ore. Wilson, last week, at a depth of six feet, in his Drake location, struck a five-foot body of galena and carbonate ore, running from 60 to 160 ozs. silver. The average value of the ore is 87 ozs. silver. The property is situated in the Pueblo district, and also yields 3 ozs per ton in gold. The Graphic mine is being worked incessantly, and both it and the Greyhound are steadily shipping ore to the Graphic smelter in this city. The Lady Franklin mine of Kingston, is the seat of continuous and important work. Its high-grade ore is shipped steadily to the Billings works of this city for treatment. The Merritt M. and M. Co.'s 10-stamp mill in this city fired up and dropped its stamps on last Tuesday afternoon. In the vicinity of the hopper an immense pile of mineral awaits treatment. The Merritt mine continues to be worked by two shifts of 15 men each, and the ore is shipped daily to the mill. It is making a fine record; the quality of the ore is improving in its silver value and the ore bodies are enlarging.

OREGON.

PLACER AND QUARTZ.—Jacksonville *Times*, Jan. 2: Many of the miners have a good supply of water and are making the most of it. John Miller has his mines on Farmer's flat in full blast, having a full head of water. The water supply has been replenished by this week's rains, which were quite timely. Prospectors may be seen everywhere nowadays, some of whom will surely make a rich strike. Messrs. Orth and Linn are prospecting their quartz ledge on Applegate on an extensive scale. Miners are generally busy. This promises to be the best mining season we have had for many years. Cal. Cunningham and John Bardsell struck a fine ledge of quartz on Dan Fisher's homestead recently. J. R. Bailey of Applegate informs us that Jack Layton intended commencing operations with his lower ditch this week. A. Chale, R. N. Baker and others have a quartz ledge on Jackson creek which prospects well and promises to be extensive. The miners of Josephine county have more water than they have had in several years and they are making the most of it. All are busy. John C. Ruck of the Willow Springs district informs us that several important quartz discoveries have been made recently in that section. Keaton & Klippel of Poorman's creek, have an abundant supply of water and commenced working day and night this week. The Chinese have taken possession of the mines sold them by the Applegate Gravel Co. Boyd & Johnson are sinking a new shaft on their claim in Blackwell district. Chas. Nail and J. N. Casteel have located some very promising ground on Applegate and will soon commence digging a ditch that will furnish them a good supply of water. A number of the citizens of Jacksonville have formed a company and set some men to thoroughly prospect the old Bowden ledge on Jackson creek. This mine was worked at a considerable profit many years ago, but petered out after a time. There are a large number of ledges in the vicinity of Jacksonville, and in other places in southern Oregon, that were long ago abandoned as unprofitable property, which will loom up now that the improved processes of crushing ore have revolutionized everything. We may therefore look for good reports as soon as the mill is able to test the quartz. A portion of the large, new quartz mill Brown & Co. intend putting up at this place arrived at Central Point the forepart of the week and will be hauled up at once.

TATUM & BOWEN,

25, 27, 29 and 31 MAIN STREET, SAN FRANCISCO.

91 and 93 FRONT ST., PORTLAND, OREGON

Manufacturers of

MINING MACHINERY, ENGINES, BOILERS, Etc.

We are manufacturing from Special Designs of the most experienced and successful Practical and Scientific Experts, Complete Plants for all descriptions of Mining Operations, as follows:

CONCENTRATING MACHINERY—Best and Cheapest, Cornish Rolls, all Steel Wearing Parts, Most Practical Styles of Two, Three and Four Compartment Double and Single Jigs, Sizing Screens, Patent Hydraulic Separators, Tables and Concentrators.

STAMP MILLS for Reduction of Gold and Silver Ores, whether free milling or base. Most useful and substantial styles of Single and Double Discharge Mortars, Wet or Dry Crushing.

STEEL SHOES AND DIES, Tappets and Cams, cheapest and best Blake Improved Rock Crushers and Automatic Ore Feeders, Superior Amalgamating Pans with wood or iron sides.

PANS FOR TREATING GOLD ONLY, Settlers, Clean-Up Pans, Retorts, Furnaces, Dump Cars, Hoisting Machinery, Cages, Landing Dogs, etc.

CORLISS, MEYER'S CUT-OFF AND BALL'S PATENT VALVE Engines of extra strength and durability.

STEEL BOILERS of Two Sheets only, Steel Economic Boilers, combining with the safety, durability and economy of the Stationary Boiler, the convenience and portability of the Portable. It occupies but little space, and is the best and cheapest boiler ever made.

WE ALSO MANUFACTURE SAW MILL MACHINERY.

We are also Sole Agents for the Gordon and Maxwell Steam Pumping Machinery, and carry a full stock of all kinds of Mill Supplies, including the

Albany Lubricating Compound and Oils.

MACHINE TOOLS, PRESSES AND DIES, PUNCHING and SHEARING MACHINERY.

F. A. ROBBINS,

...MANUFACTURER OF...

Canners' and Soap-Makers' Presses and Dies, 20-inch Engine Lathes, 12-inch Shapers.

Punching and Shearing Machinery for Hydraulic Pipes.

SHAFTING, HANGERS, AND PULLEYS.
Gear Cutting a Specialty.

221 and 223 First St., San Francisco.

PELTON'S WATER WHEEL.

THIS WAS ONE OF THE FOUR WHEELS TESTED by the Idaho Company at Grass Valley, Cal., and gave 90 2 per cent., distancing all competitors. Send for Circulars and guaranteed estimates.

Quartz Mill Screens a Specialty.

147 Beale Street, San Francisco.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the **IMPROVED FORM OF HYDRAULIC GIANTS**, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

IMPROVED HYDRAULIC MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.

HOSKIN & CO., Marysville, Cal.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be discarded from the pipes, often costing more than a new valve. The JENKINS Disc joined in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Miscellaneous.

MONTANA and Dakota are both desirous of becoming States.

The King mine, at Lone Mountain, Elko county, has been sold for \$10,000.

It is calculated that 193,175 tons of coal were shipped from Seattle in 1885.

The miners in the Bonanza mines at Quijotoa, A. T., refuse to accept \$3 a day, and have gone on a strike.

A CONVENTION of steel-makers is to be held at Pittsburgh, Pa., to consider the question of prices and wages.

The Wenban mill and mining property at Cortez, Nev., has been bonded to San Francisco capitalists for \$1,200,000.

The monthly pay-rolls for labor in the mines of Eureka district and at the two reduction works in town will aggregate not over \$35,000.

A COMPLAINT has been filed at Stockton against Calaveras miners to enjoin the deposit of tailings and slickens in Chili gulch, a tributary of the Calaveras.

THE Port Townsend *Argus* says: Charles Morrison, who lives near Irondale, has discovered an extensive deposit of iron ore on his land. He will probably realize on it handsomely some of these days.

THREE is a mining boom in Julian, San Diego county. New mines are being opened up, and old mines are yielding better than ever. There was quite an excitement over the discovery of this camp in 1870.

THE Los Angeles City Council has granted Charles H. Howland and associates a franchise for the laying of a double track for an electric or steam railway, the work to begin within 90 days and be completed in three years.

THE Barber canyon placer mines, near Dun Glen, Nev., are not turning out as well as anticipated. Water is encountered before the bed rock is reached, and the Chinese, who are working the mines, cannot control it.

Lane Lectures.

The fourth course of Popular Lectures at Cooper Medical College, corner Sacramento and Webster streets, S. F., will be delivered during the coming winter. As has been announced before, these lectures are free. No ticket of admission is required. The following is a list of the times, place and subjects of lectures.

Jan. 8, 1886, Professor L. C. Lane, "The Medicine of the Prophet;" Jan. 22d, Prof. C. N. Ellinwood, "The Blood;" Feb. 5th, Prof. A. Barkan, "The Prevention of Blindness;" Feb. 19th, Prof. J. H. Wythe, "What is an Egg?" March 5th, Doctor John F. Morse, "Something About Hospitals;" March 19th, Prof. Chas. H. Steele, "Opium;" April 21, Prof. J. O. Hirschfelder, "Digestion and Indigestion;" April 16th, Prof. Henry Gibbons, Jr., "The Foot;" May 7th, Prof. W. D. Johnston, "Electricity;" May 21st, Prof. W. D. Johnston, "Electricity."

WORKING PEOPLE AND THEIR EMPLOYERS.—By Washington Gladden. 12mo, 241 pp., paper. Price 25 cents.

"This book we cordially commend. It is sound and economic in principle, and Christian in spirit."—N. Y. *Examiner*.

We will furnish (within 30 days at farthest) the above work, post-paid, at half price to new or old subscribers on paying for this paper up to one year in advance of this date. See our offer of desirable books on similar terms, inserted from time to time in this paper.

THE MINING AND SCIENTIFIC PRESS, of San Francisco, has entered upon its 521 volume. It is the oldest mining journal in the United States and one of the best.—*Tuscarora Times-Review*.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (enclosing one cent only will suffice). We will not knowingly send a paper to anyone who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

PHENIX M. & Co., Jan. 6th.—Capital stock, \$1,000,000. Directors: William B. Robertson, N. M. Bell, William B. Brison, W. C. Brown and Thomas W. Chinn.

CAPAZON LAND AND WATER CO., Jan. 6th.—Object, buying and selling lands, and for irrigating lands in San Bernardino and San Diego counties. Capital stock, \$128,000. Directors: E. J. Pringle, Thomas E. Pope, George C. Boardman, William J. Swyne, George W. Spencer.

PACIFIC TANNERS' ASSOCIATION, Jan. 6th.—Object, carrying on the business of tanning leather in all its departments and dealing in hides, leather, tallow, etc. Capital stock, \$500,000. Directors: John C. Rued, Anton Krieg, Hermann Kullman, Jacob Eberhard, Thomas McKay, Jacob Salz and Maurice Goetz.

NORTHERN CATTLE CO., Jan. 5th.—Object, to deal in horses and cattle in Nevada and Montana. Capital stock, \$450,000. Directors: J. F. Boyd, Joseph Scott, William Willis, William S. Wood and L. Osborn.

DELTA M. CO., Dec. 30th.—Location, Shasta Co., Cal. Capital stock, \$2,000,000. Directors: John Bell, Parker Crittenden, Thomas Bussy, F. K. Gallagher and G. Adams.

Mining Share Market.

The holidays took a couple of days time from the stock board, but this week, while its sessions have been held, nothing of special moment has occurred. On the Comstock, the sinking of the Combination shaft deeper for the 3200 level is progressing well, and is over 50 feet below the 3100 level. The proposed sinking of the Osbiston shaft deeper will be commenced in a few days. Very little may be expected in the way of practical ore development until this already deepest shaft on the American continent shall have attained its proposed immediate future depth of 3200 feet. At that level it is thought that a good ore body will be found, and for this purpose the Osbiston shaft of the Gould and Curry and Best and Belcher mines is to be sunk deeper, in order to connect and intersect at a corresponding lowest level by means of lateral drifts south.

The following mining companies report a cash balance on hand December 31, 1885, as per sworn statements filed in their respective offices: Alta, \$8,388.95; Benton Con., \$390.33; Ophir, \$12,660.20; Gould & Curry, \$3,683.75; Utah, \$7,173.31; Con. California & Virginia, cash \$94,367.52 and unsold bullion \$32,762.99; Alpha, \$4,156.47; Bulwer, \$17,552.72; Best & Belcher, \$11,523.33; Chollar, \$6,380.28; Mexican, \$8,758.49; Occidental, \$2,682.27; Sierra Nevada, \$6,813.46; Exchequer, \$7,397.02; Holmes, cash \$4,664.83 and \$40,901.08 assay value of unsold bullion on hand, indebtedness of company \$26,282.82; Crown Point, \$26,941.33.

Bullion Shipments.

Oro Grande Mill, Jan. 3. \$4437; Koebig's Mill, 3, \$700; Germania, Dec. 30, \$8265; Lead Mine, 30, \$1100; Kentuck, 31, \$10,000; Vienna, 31, \$1752; Bannock, 31, \$1682; Alice, 31, \$11,513.

Following were the ore and bullion shipments from Salt Lake City for the week ending Jan. 2: Twenty cars of bullion, 481,365 pounds, and 25 cars of ore, 704,780 pounds.

Missing Papers.

We mail and send our papers to subscribers as carefully and regularly as possible, but changes occurring sometimes in our mailing hands, by illness or otherwise, or changes in the Postoffice here or at the place of delivery, may cause irregularity in the receipt of the paper by the subscriber. We therefore request that *always*, when subscribers fail to receive their paper, in due time that they notify the office by postal card or letter, and we will, if possible, remail all missing numbers.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

NOVELTIES just received at Muller's optical depot, 135 Montgomery St., near Bneh. x

Newspaper Agents Wanted.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference.—DEWEY & Co., Publishers, No. 252 Market St., S. F.

Market Reports.

Please Remit.

We would call the attention of patrons who have not yet remitted their subscriptions for 1886, to the "List of Inducements" at present offered in our columns, and urge all who can to remit to us at this time. We are not only in need of that which is due to date, in making settlements, but can use to great advantage remittances for the next year, in making improvements and better arrangements for the future. Those who do not wish to select their premiums at the time of making payment, will, if they so request, receive certificates whereby they can order premiums at any time within six months.

THE Los Angeles City Council has been asked for a franchise for the construction of a double-track electric street railroad some twelve miles long. It is estimated that the road will cost about \$30,000 a mile.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we offer the following advantages to all new subscribers who pay one year in advance, or present subscribers who will pay their subscriptions up to a date fully one year in advance of the present time. We will furnish the following articles (while this notice continues), at the reduced rates named, viz.:

- 1.—World's Encyclopedia, 704 pages, with 1,200 illustrations, worth \$1.75. Postpaid for 50 cts.
- 2.—Patent Binder (cloth cover) with name of this paper in gilt. Postpaid for 50 cts. \$1.00
- 3.—To New Subscribers, 12 select back Nos. of the MINING AND SCIENTIFIC PRESS. Free .75
- 4.—Any of Harper's first class periodicals, 15 per cent less than regular rates.
- 5.—Frank Leslie's and most other U. S. periodicals, 15 per cent discount from regular rates.
- 6.—Pacific Coast and Eastern Dailies, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent less than advertised retail rates.
- 7.—Picturesque Arizona, 350 pages, in cloth and gilt. Postpaid for 25 cts. 1.25
- 8.—California, 100 pages, Magazine, 1880 to 1882 (3 Vols.) single Nos. Postpaid for 3 cts. .35
- 9.—For volume, unbound, 5 Vols., Postpaid for 20 cts. 2.00
- 10.—Per volume, bound, cloth back and stiff paper sides. Postpaid for 40 cts. 2.50
- 11.—Picturesque California Homes (40 building plans and estimates). Postpaid for \$1 35
- 12.—Dewey's Patent Newspaper File Holder (18 to 30 inch). Postpaid for 25 cts. .50
- 13.—Life among the Apaches, 322 pages, stiff cloth. Postpaid for 25 cts. 1.00

NOTE.—The cash must accompany all orders. If too much is sent for any article or publication, the balance will be returned immediately. Address this office, No. 252 Market St., S. F.

P. S.—No. 11 is really a valuable premium to new-comers and others who appreciate the better class of stories and a good standard of California literature.

Webster's Dictionary, 634 pages, with 1,500 illustrations. .50 cts. 1.50

Grant Lithograph, size 24x19. .50 cts. .50

Cleveland Fine Steel Plate, size 12x16. .10 cts. .50

Grant Steel Plate, cabinet size. .10 cts. .50

De Groot's History of Mining in California. 5 cts. .25

Beautiful Poetic Review, a handsome, entertaining and instructive souvenir of real merit. .25 cts. .50

Send for any further information desired. Readers will please inform their new neighbors and others concerning our paper and these offerings. On application, sample copies of this paper will be mailed free to the address of any persons thought likely to subscribe.

BOOKS—ENTERTAINING, MORAL, RELIGIOUS, At Less than Half Publishers' Prices.

To New and Old Subscribers who pay 1 year in advance.

To secure a host of new subscribers, and prompt renewals from our old patrons of this paper, while this notice appears, we will mail, POST-PAID, within twenty days at farthest, any of the following publications, on the terms named below: In ordering, give only the No. of each book wanted:

All these books are printed in large, clear type, on good paper, and are bound in paper covers.

Remittances must accompany the order. Any subscriber can avail himself of this offer by forwarding sufficient to make his subscription paid one year in advance.

THE Bodie Free Press says that it is now known that the Bodie and Benton Railroad will be extended to Aurora, Esmeralda county, Nev., in the early spring. The distance is nine miles, and the cost will be about \$10,000 per mile. The Esmeralda Company will locate extensive reduction works on Mono lake to utilize the water and adjacent timber.

PLENTY OF GOVERNMENT LAND.—In reply to many inquiries from all over the United States, the Inyo Independent says there are thousands of acres of fine Government land open for settlement in Owens valley; plenty of water, a good market, a delightful climate, a well equipped railroad, and every inducement to invite settlers. It is not possible to write long letters in reply to all these inquiries, but a pamphlet will soon be ready for distribution, giving full information on all matters pertaining to Inyo county, and copies will be sent to all inquirers. The Independent is published at Independence, Inyo county, Cal.

AGRICULTURAL AND MINERAL LANDS.—A dispatch from Oroville on Tuesday cites an important decision by Judge Freer, that the United States patent to the railroad company carried with it all the minerals not known to exist at the date of its issuance. This decision follows a recent one of the Supreme Court of the United States, and disposes of a question which has long kept the agricultural title in mineral sections in dispute and litigation.

A COLOSSAL WORK COMPLETED.

A Book for all Persons who Make, Buy, Sell, Use, or Want to Know anything about Tools or Machines, or are curious as to the History and Development of Mechanic Art.

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO, CAL.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of invention in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.
The undersigned are the **SOLE IMPORTERS** of the above Coke, which is for sale in quanti-
ties to suit purchasers.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

RANKIN, BRAYTON & CO.,
...BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnaces CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

SEND FOR CIRCULAR.

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

Old Mining Plates Bought, Replated, or Gold Separated. 3000 Orders filled. Reference first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.
E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

Determination of Rock-forming Minerals.

There are two methods of examining rocks, the macroscopical and the microscopical.

In the macroscopical investigation of rocks, those parts of the mineral mixture discernible with the naked eye can be studied with reference to crystalline form, cleavage, color, luster, streak, hardness, solubility, or acids, etc. For the more exact optical investigation, however, cleavage sections exactly orientated must be obtained, the cleavage angle, when possible, measured, in order to determine the plane of cleavage, and the section, if not already transparent, ground thin. Such an investigation of the rocks-forming minerals leads in most cases to the goal, provided the particles have a certain magnitude.

Isolated particles of minerals can be examined before the blow-pipe; yet, because of their minuteness, such a purely macroscopical examination is insufficient in most cases. This is especially true in porphyritic or very fine-grained rocks, and therefore for these rocks the microscopical examination is employed. It is necessary in such a case that the pieces of rock under examination shall be ground into thin transparent leaves. In such sections the single constituents are cut in most varied directions. By these minute cross sections the crystals and the rock-forming minerals can be determined by optical methods with the polarization microscope, and by combination of the optical with the crystallographical properties, *i. e.* with the form of the cross section, that is, crystalline form and cleavage.

This determination is more difficult if the minerals occur only as grains. Of course here also the human eye has its limitations; if the separate particles are so minute that they cannot be observed in section, that is, afford no cross sections; or, when examined under the highest possible magnifying power they give no figures suitable—large enough—for optical study, then determination by the polarization microscope is impossible.

A very complete work on the "Determination of Rock-forming Minerals," by Dr. Eugen Hussak, of the University of Graz, has been translated from the German by Dr. E. G. Smith, of Beloit college, Wisconsin, and published by John Wiley & Sons, of New York. In this book is given a description of the method of producing preparations from rocks suitable for microscopical study; of the application of the polarization-microscope adapted to the complete exposition of the optical and chemical methods of determination; then follows a discussion of the mechanical separation of the rock constituents according to their specific purity and by the electro magnet; and, finally, a short chapter on the structure of the rock-forming minerals, and a systematic survey of them. The tables for determining minerals are very complete and well arranged. The book is illustrated. A very important chapter to students of mineralogy is that giving the bibliography. The whole work is a very useful one to mineralogists, for reference. Heretofore books of this character have only been accessible to those conversant with German or French, so that the English translation will probably be largely used.

INYO and San Bernardino are the two principal silver producing counties in the State,

Deep Mining.

It was at one time thought that very deep mining had been tested on the Comstock and found to be unprofitable. The difficulty has been in single companies undertaking the expensive work, but now that there is concert of action, with a general system, better results are looked for. Ventilation and drainage are the two great requisites in deep mining work. It was to procure these important adjuncts that

Savage north line, which will eventually connect with the drift now being run north on the 3100 level of Hale & Norcross, and which has about reached the Savage south line. This new work is very important to this section of the Comstock, and if results are favorable other deep explorations may be carried on.

Lixiviation by Aid of Suction.

In answer to a correspondent we may state

VAT FOR LEACHING BY SUCTION.

the Combination shaft was started some years ago by the Savage, Hale & Norcross and Chollar-Potosi Companies, each of which had its own shaft, but was unable to sink any deeper through it. The Combination shaft has enabled the ledge to be explored to the depth of 3100 feet, and it is possible to go several hundred feet deeper through its aid.

Now, the Best & Belcher Mining Company having agreed to join with the Gould & Curry

that lixiviation with aid of motion is of great advantage where it can be arranged. The leaching boxes must be located 10 or 12 feet above the precipitating vats. The arrangement is as shown in the cut. The hose *c* is inserted at the lowest point of the vat below the false bottom; then there is a glass pipe *d* reaching outside near the rim of the vat. The hose, before commencing, is likewise lifted as high as the glass tube. The first staves on the bottom

DOUBLE FURNACE FOR ROASTING SULPHURETS.

in sinking the Oshiston shaft deeper, to correspond and communicate with the lowest levels of the Combination shaft and the Chollar, Norcross and Savage mines, 3200 feet below the surface, this work is to be actively prosecuted further under Superintendent D. B. Lyman, official orders having been given to that effect. In compliance therewith, the ponderous and effective machinery at the works is being put in working condition, and the humps are to be started up directly to take out the water, preparatory to sinking the shaft deeper. The difference in the surface level of the two shafts being 171 feet, the Oshiston shaft will have to be sunk 3029 feet in order to correspond with the 3200 level of the Combination shaft. This is necessarily the work of some months. The work on the Oshiston shaft was suspended after being sunk to 2700 feet. A winze will be sunk on the 2500 level of Gould & Curry, near the

of the vat are represented by *a* and the second row by *b*, which is covered with the cloth. After the vat is filled with ore and the water admitted, the air below the false bottom escapes through both pipes; but after a while when the water rises and covers the mouth of the hose, the air between the upper staves goes through the glass tube, and is followed by the water. When this reaches the water level inside the tank, the tube is shut by a tight stopper, and the hose lowered down to the precipitating vats. The lixiviation is much quicker than without suction, but the hose should not be too large.

LOCAL astronomers were disappointed on Saturday night in not obtaining observations desired of Saturn and *Mu Geminorum*. The small star could not be seen, the atmospheric conditions being unfavorable.

Sulphuret Roasting Furnace.

There is considerable interest just now in this State and elsewhere on the subject of furnaces for roasting sulphurets. We give an engraving showing, in longitudinal section, a form of double roasting furnace for this purpose which Mr. Deetken, who has had long experience in roasting sulphurets in California, told the late Mr. Kustel he considered superior to the long ones or others he had used.

The lower hearth, *a*, is nine feet long and 10 feet wide. The roof in the center is 28 inches, and at the flue-bridge 14 inches above the hearth. The fire-place, *r*, is 20 inches wide, 8 feet long and 20 inches from the roof. The flue, *b*, ascends to the upper hearth, *c*; the working door is on the back side. In case there should be required more heat than is obtained from the lower hearth, there is an auxiliary fire-place, *r'*. The flame goes through the flue, *b*, into the dust chambers. These chambers have cross-petitions lengthwise, by which the draught is forced to take a longer way before it enters the chimney. From the upper hearth the ore is drawn through the flue, *b*, to the lower hearth; *ee* are canals for the escape of moisture, and *e'e'* for the tie-rods. The two hearths can be used separately, if desired.

This furnace, although somewhat inconvenient for the roasters, has the advantage of taking up less space, and as the ore drops from the drying hearth on the second, and from there on the first hearth, it effects a good mixing of the not uniformly heated ore. The auxiliary fire is useful for silver ores, which seldom contain so much sulphur as to burn long enough without the help of a nearer fire than that from the lower hearth. In working concentrated sulphurets, the upper fire can be dispensed with. The arch in the middle is only eight inches thick, but, being made level, the thickness increases toward the sides. A few days after starting up, the whole roof is sufficiently heated to keep the entire mass of the sulphurets red hot throughout, and the fuel is better utilized; one ton always being drawn from the upper hearth, when the preceding charge is finished. The charge on the lower hearth requires, generally, from eight to ten hours before the roasting is completed. In constructing a double furnace, in two stores, it is essential to use a number of iron ties across the width of the furnace between the lower and upper hearth; otherwise, on account of the weight of the upper charged hearth, the side wall would invariably give way in the course of a while. If used for the roasting of gold sulphurets, or such ores as do not require the auxiliary fire, the working doors can be placed at *m* and *n*, and, at *m*, a hoe can be advantageously used in drawing the charge to the lower hearth.

DOUBLE EDITION.—Next week we shall issue a double edition of the MINING AND SCIENTIFIC PRESS, giving a review of the mining industry of the Pacific Coast for the past year. The number will be of interest and value for reference, containing, as it will, statistics of the various branches of mining.

It is becoming more evident every day that the silver men are masters of the situation. It is not probable that Congress will materially interfere with the present law.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eos.

Montana Mines.

Granite Mountain Reduction Works.

[By Our Traveling Correspondent, R. G. Huston.]

The Granite Mountain mine is located four miles southeast of Phillipsburg, Deer Lodge county, and is, without exception or exaggeration, one of the finest in the Union. The fact that between April 8th and August 1st, 1885, they paid \$260,000 in dividends, is proof enough that I am not saying too much. They are situated about equidistant from Anaconda, on the Utah Northern and Drummond on the North Pacific, and get all their supplies from Drummond, as the road is much the best that way.

Their mill now consists of 30 stamps, one of the Howell improved cylinders, and the usual number of pans and settlers for operating that number of stamps. The mill is built on the mountain side below the mouth of the main tunnel, so they are enabled to do their work systematically and with very little expense in transferring from one department to the other by chutes, making the handling comparatively inexpensive.

At a conservative estimate, they have near ten million dollars worth of ore in sight, and are still following the lead in with magnificent prospects in the breast of the tunnel. This tunnel has been run for 850 feet on continuous pay in ore of a very high grade. Four men are now taking out ore enough to produce over \$100,000 per month, which proves that I do not overestimate the value of this property. This is tunnel No. 5; and No. 4, No. 3 and No. 2 are all open and in paying ore. The extra cost of a few dollars freight on the amount of salt used by this company would not be thought of or felt as it is by the lower grade of ores around Butte. This company supply their works with salt from Michigan via the Northern Pacific at the same rate the Butte people have to pay for a very inferior article from Salt Lake.

The size of the lead varies from one foot to 13 feet and they are working through a series of 5 tunnels, these running into the mountain on the lead at distances of from 200 feet to 300 feet apart, which have developed the mines enough for the present, as they now have ore enough in sight to run their present milling capacity for a long time. They are using an air compressor which runs 5 Burleigh drills. They have a steam hoist on one shaft. This is put in to lessen the expense of getting the ore from tunnel No. 5, which is some 200 feet below the mill, and in which they find some of their best ore. An average assay from the face of tunnel No. 5, on Nov. 27th, showed an assay value of 437 oz. silver.

Twenty samples sent to the New Orleans Exposition showed an average assay value of 227.8 oz. per ton. The highest assay was 5773 oz., and the lowest 296. They are now by running their 30 stamps working 30 tons daily, and are producing from 120 to 130 bars of bullion per month of a weight ranging from 1300 oz. to 1450 oz. each. This bullion carries about 25 per cent copper, the balance being fine silver leaving from 120,000 oz. to 130,000 oz. of fine silver per month; a very pleasant mining stock to have a supply of.

This mine is owned and operated by a St. Louis Co., Lewis M. Ramsay, President and August B. Ewing, Vice-President, Paul A. Fusz, Treasurer, John T. Fields, Secretary. They are ably represented in Montana by Capt. John W. Plummer, superintendent and manager, who having had years of experience is fully alive to the interests of the company at all times. Messrs. Hand & Coit are assayers for the company and are thoroughly up in their business as well as being very affable gentlemen for a newspaper man to come in contact with.

The Granite Mountain mine is a good example of how near a man in mining may come to a good mine and yet miss it. There had been prospecting done on it for several years, and nothing of consequence struck, and finally the company concluded at one of their meetings to shut down work, and telegraphed to stop it. At the same time the manager here was telegraphing them that he had struck the lead, and thus apparently the two telegrams passed each other on the way. As you see, however, the mine was not shut down, but had the company meeting been a day or two sooner, the development of the Granite Mountain would have been indefinitely postponed, a calamity that would have been a severe blow to this portion of Montana. The company are at present, on the mill and mine, giving employment to about 125 men, and many others gain their living from it indirectly. They are thus disbursing a large sum of money each month, which goes into general circulation.

Phillipsburg is the main point of supplies. It is a town of several hundred inhabitants. The Kaiser House is the principal hotel. There are several very good general stores, the usual amount of saloons, blacksmith shops, livery stables, etc. Flint creek valley, close by, is devoted to hay ranches; and further down, vegetables of all kinds are raised in abundance. It is also a good stock country. Horses and cattle running out on the range, though it is mid-winter, are in good condition.

There are a great many men at work in differ-

ent directions from this camp, prospecting, all living in hopes that they may fortunately strike on another Granite Mountain, Hops or Cable mine, and I truly wish they may, as their perseverance deserves to be rewarded.

The Miners' Side of the Debris Question.

The Miners' Association Memorial to the Secretary of War.

The following is a copy of the memorial addressed by the Miners' Association of California to the Hon. Secretary of War in response to the anti-debris document, which was presented to our board of supervisors in November last and subsequently signed by a majority of the board in their individual capacity:

OFFICE MINERS' ASSOCIATION,
320 Sansome Street, Room 23,
SAN FRANCISCO, Dec. 29, 1885.

To the Hon. William C. Endicott, Secretary of War, U. S., Washington, D. C.—DEAR SIR: Your memorialists, the Miners' Association of California, representing nearly 100 hydraulic mining claims, held by patent from the Government of the United States, and upon which they have expended in improvements incident to the prosecution of this class of mining the sum of (approximately) as found by United States Circuit Judge Sawyer) \$100,000,000, respectfully desire to enter their protest against certain statements contained in a memorial addressed to you and indorsed by the board of trustees of Sacramento city on October 25th, and subsequently by a number of the individuals composing the board of supervisors of San Francisco, but not officially, on November 17th.

Your memorialists, as citizens of the United States, and as representatives of the mining industry, are now, ever have been and are still desirous that the general Government should take measures to protect the navigability of our rivers by the judicious expenditure of such sums as have heretofore been appropriated for that purpose, but have been withheld by your predecessor on false representations, and which are now reproduced in the document hereinabove referred to, it being a duplicate of the preamble and resolutions emanating from the "Anti-Debris Association of Marysville." Neither of these documents contains any suggestion whatever with reference to a proper expenditure of the appropriation of \$250,000 already made and withheld during the term of office of Hon. Robert Lincoln.

The whole tenor of the document is an appeal for the interferences of federal departments in matters now in abeyance in the federal and State courts, based on statements some of which are totally erroneous and others matters of controversy.

While your memorialists admit that the navigable condition of the Sacramento river during the low-water season is in a deplorable condition, we deny that hydraulic mining is, as alleged, the prime factor, and submit that the condition of the river is in large degree due to natural causes, and to the incidents following this settlement and cultivation of the country on its water-shed, combined with the loosening of vast amounts of earth in the search for gold at an early period of our history. This material, which was enormously in excess of all deposits since, was deposited in the mountain streams long before hydraulic mining was known, and has gradually worked its way down to the main rivers, mingling enroute with the detritus from all classes of mining—hydraulic, drift and quartz crushings—as well as from agricultural and other causes. The two latter classes of mining have in the aggregate and are now supplying as much, if not more, material than the hydraulic mines, and any action by the federal departments tending to hamper or obstruct the business of hydraulic mining will of necessity apply to all classes of mining.

In this connection we respectfully submit that had the Congressional appropriation of \$250,000 been expended on the rivers by your predecessor, under the supervision of the proper Government engineers, there would not have been cause of complaint, and we reassert that the obstruction to the expenditure was by the direct act of the authors of the memorial hereinbefore referred to—the Anti-Debris Association of Marysville.

While we recognize that it is the province of your department to take cognizance of the condition of the bays and harbors, the navy yards, arsenals, forts and other Government property, as well as navigable rivers, we respectfully suggest that authentic and reliable data on these subjects can be obtained only from the records of the War Department, and through its resident officers and engineers. The boards of supervisors of the different counties can have no personal or official knowledge of the subject matter of the memorial.

Your memorialists further represent that the statements of this memorial in respect to the quantity of land covered by mining debris, its value, and the amount of gravel put in the streams, are widely at variance with the facts, and are not sustained by any official report emanating from a Government or State engineer, or by any judicial finding, either federal or State. To controvert those statements in detail would be a loss of time. They rest merely on the *ipse dixit* of unscientific and irresponsible bodies, so far as the issues involved are concerned.

We repudiate with indignation the charge that "a considerable number of the hydraulic mining corporations, and also individual owners of mines, continue to run great quantities

of debris into the rivers, in defiance of law." And we assert that no mines are being run without the knowledge and sanction of the federal and State courts which have assumed jurisdiction, and in their wisdom have judiciously decreed that such mines may be worked lawfully when the property of others is not injured.

Your memorialists further represent that the average producing capacity of the gold mines of California is at least \$20,000,000 per annum, but that by reason of litigation arising between farmers and miners and the insecurity to mining property resulting therefrom, the gold product has been decreased to thirteen and a half millions, and is in danger of falling to ten millions or less per annum in the near future. This has been attended with much business depression, and suffering, pending the legal adjustment of the rights of the parties litigant; but the whole matter has now resolved itself into a few problems of law and engineering, which can be settled without the intervention of your Department, other than in the performance of its functions as a protector of Government property.

We further represent that the gold-bearing period of life in our State, based on an average production of twenty millions per annum, cannot be predicted with any degree of certainty, but from data compiled from official and scientific sources we feel confident in placing the minimum term at 100 years, and even then our mines will not be exhausted.

We assert, without fear of contradiction by good engineering authority, that a very large percentage of the auriferous gravel to be washed may be retained in the mountain streams by proper dams, so it will never reach the navigable rivers in a quantity to tax their carrying capacity in the least, when such rivers are improved. Many such dams have already been constructed and maintained, some of them with the knowledge and sanction of the United States Circuit court; and both the federal and State courts have uniformly decided that on a proper showing of the restraint of any mining debris complained of, they would modify or dissolve the injunctions heretofore issued. The burden of the constructions of such dams would fall on the miners, who are willing, to the extent of their ability, to assume it, on the assurance of non-intervention from sources other than the courts.

Your memorialists, however, beg to call your attention to the fact that it is unjust to the present mining interest to impose upon it, if it was able to sustain it, the entire expense now of such restraining structures as your engineers might deem necessary, in improving the navigable rivers, which improvements must commence in the tributaries, now laden and filled with detritus from all sources since gold was first discovered. That the miners are not only desirous, but willing to aid the Government in such work, is evident from the offer that was made to your predecessor, to give to the Government the sum of \$125,000 provided the Government would devote a like sum out of the \$250,000 appropriated to the construction of a single restraining dam in the Yuba river, to prevent material now there from coming down into the lower river. This application of a part of the appropriation was defeated by those who are still opposed to any expenditure (until gold gravel mining in California has entirely ceased), and who have prepared and forwarded to you the memorial referred to.

The miners, as a class, are not such outlaws as said memorial classes them, and beg to assure you of their sincere regard for our courts and the law as well as the belief that the evils complained of from mining debris can be easily cured with out destroying the mining industry; but this can only be done properly by the general Government, in which work the miners will join heartily. And they ask that, instead of further oppressing them and their industry, as requested by the anti-mining memorial hereinbefore referred to, the general Government shall come to their relief in such manner as its engineers may deem most feasible. Respectfully submitted,

THE MINERS' ASSOCIATION.

L. L. ROBINSON, President.

W. A. SKIDMORE, Secretary.

Academy of Sciences.

The annual meeting of the California Academy of Sciences was held on Monday, January 4th, Professor George Davidson presiding. The names of J. W. Anderson, Charles H. Clark and George A. Johnson were proposed for membership. L. H. Foote, ex-Minister to Corea, Professor Edward S. Holden, President of the University of California, and E. S. Clarke were elected members of the Academy. E. L. Greene was elected a life member for valuable services rendered to the Academy.

The Recording Secretary, C. G. Yale, presented his annual report, which showed that 22 members had been added to the roll during the last year—15 resident members, 6 life members and one honorary member. There are now in the society 141 life members and 172 resident members, making a total of 313.

Treasurer Brooks' report showed that the total receipts for the year were \$10,101.44, and the disbursements \$8840.74, leaving a cash balance in favor of the society of \$1260.70.

The report of the Librarian, Carlos Troyer, went into details regarding the cataloguing and indexing of the books belonging to the Acad-

emy, which is being done by Captain Churchill. There have been three bulletins published by the society, and Bulletin 4 will be published during the present year. The society is now making exchanges with 220 societies of science and learning in different parts of the world. The report stated that the proceedings and memoirs of the society should be published in order to facilitate correspondence with other societies of sciences.

E. L. Greene, Curator of Botany, reported that the herbarium of the society was in a magnificent condition. During the year just ended the following donations and contributions were made: One hundred species from Dakota, 200 from Oregon, 320 from Arizona and Sonora, 100 from Eastern California, 50 from Northern California, 40 from Colorado, 1200 from Europe and Africa, 500 from Australia, and other small contributions, making a total of 3055 species. Many of these were rare specimens, and some of them unknown to science before. Mr. Curran is engaged in the task of poisoning the specimens in the herbarium, to prevent destruction from bugs and pests.

W. G. Harford, Director of the Museum, reported that many contributions had been made to the museum during the year.

Mr. Keep, Curator of Conchology, presented his report, the tenor of which was that 500 specimens of shells had been donated during 1885. He is engaged in assorting, marking and numbering the collection, about 2100 boxes being completed.

The report of the Board of Trustees gave the history of different business transactions during the year, and presented a financial summary similar to the statement made by the Treasurer. The report stated that the Trustees had been compelled to borrow \$5000 on a promissory note from the Lick Trustees, but this was for an occasion of urgent necessity, although the greatest economy had been practiced. The Board hoped that this act would not be taken as a precedent, and that its successors would follow the rigid rule which had always been the policy of the Trustees, to borrow no money unless there was sufficient security on hand to balance the indebtedness.

President Davidson, in accordance with the custom of retiring officers, presented a paper on the general condition of the association during the past year. The paper discussed the reports of the different officers, and argued that their contents justified the assertion that the Academy was enjoying a season of substantial prosperity, and that the scientific progress was all that could be desired. Prof. Davidson then reviewed the history of the Academy since its inception, and singled out each landmark in the progress of the society, from the visit of Agassiz in 1870 to the Lick bequest in 1878. The paper pictured a bright outlook for the Academy. It referred to the generous donations of Charles Crocker, Leland Stanford and James Lick, and with donations from other sources, the Academy has now before it a prospect equal to that of similar organizations abroad, which have long stood in the front rank of investigators of science. The report alluded to a legacy which is yet in store for the Academy, and has been reduced to writing, but from whom was not stated. President Davidson paid a high tribute to the devoted labors of Dr. Kellogg, who is the only surviving one of the founders of the institution.

The librarian reported that the council at its last meeting resolved that the library of the Academy should be for reference only, and that no books should be loaned outside.

The judges and inspectors of this election, which was held during the day, reported the election of the following officers and trustees: President, George Davidson; 1st Vice-President, Justin P. Moore; 2d Vice-President, J. T. Evans; Corresponding Secretary, S. B. Christy; Recording Secretary, Charles G. Yale; Treasurer, Elisha Brooks; Librarian, Carlos Troyer; Director of the Museum, W. G. W. Harford. Trustees—George E. Gray, Thomas P. Madden, Charles F. Crocker, Ralph C. Harrison, Lewis Garstle, Robert W. Simpson, James M. McDonald.

Professor Davidson remarked that an event would take place on the night of the 9th inst., which he had for many years longed to witness, namely, the occultation of a star by the planet Saturn. He hopes to be able to satisfy himself whether the star can be seen through the dividing rings and the dusky rings. The star (*Mu Geminorum*) that will be occultated is so small or so distant—eleventh magnitude—as to require a telescope of considerable power to see it. The phenomenon will begin at a quarter before 7 o'clock P. M. and end at 10:30 P. M.

Judge Freer of Oroville has granted a new trial in the case of McElroy vs. Collins et al., holding that under the Deadwood town-site decision by the Supreme Court of the United States the mineral reservation in railroad patents does not affect a mineral not known to exist at the time of the issuance of such patent, all mineral discovered after the issuance of the patent passing to the patentee.

The Herald says: The business which the mines of Southern California, Arizona and New Mexico bring to Los Angeles is becoming immense. It is safe to say that 25 carloads of goods, wares, merchandise and produce are daily sent to these mines by the merchants of this city.

News from the Cassiar gold fields says the hill diggings struck on Deass creek give \$14 to a pan of dirt.

MECHANICAL PROGRESS.

One Result of the Multiplication of Special Machines.

It must be evident to the observer that the increasing use of special costly tools for rapidly doing much of the work formerly done through ordinary machine shop processes has not worked so much injury to small shops where such tools cannot be afforded, as was predicted. More and more every year the work done by such machines is turned out in the way of articles of regular manufacture, and sold in many instances cheaper than they could be made in the small shops even with the special tools, in use only part of the time. There is no occasion in the small shops for machinery for making taps, reamers and such small tools; they can be bought from the manufacturer for less money than they could be made. Gear wheels are carried in stock by manufacturers, and the same is true of other standard parts of machines. Most shops, large or small, buy finished nuts, studs, bolts and set screws in preference to making them. The establishment of standard sizes and shapes has been a blessing in this respect to the small machine shop; as further standards are agreed upon, the finished parts of machines and machinery that will be furnished from manufacturing entirely devoted to their manufacture will be still further increased, to the manifest advantage of the small machine shops. There is compensation in everything; the tendency to special manufacture created by the use of these costly special machines leaves the prospects of the machinist who starts in a small way in about as satisfactory a condition for achieving success as ever. Those things which he cannot afford to arrange for making cheaply, he is likely to find offered to him readily made at prices lower than they are likely to be produced by anyone, except he makes a business of making them.—*American Machinist*.

CASTING AND COOLING HEAVY CASTINGS AT KRUPP'S.—Mr. Geo. Richards, superintendent of the motive power of the Boston and Providence Railroad, was lately in Europe, and was one of the very few visitors who have succeeded in gaining admission to the famous Krupp steel works at Essen. He saw a ten-ton crucible steel casting being poured, and an enormous 70-ton steel casting being very gradually cooled, the outside being warmed with coke fires until the inside had partly solidified, when the block was to be hammered into shape to form the main piece of an immense gun. The enormous array of furnaces in which the crucibles are heated, and the perfect manner in which a large number of men (in some cases 500) all lift their 80-pound crucibles out of the furnaces, and pour them into the mold in rapid succession, is described as being a wonderful sight. The scrupulous care bestowed upon the minutest detail was a noticeable feature about their manipulation of steel. If, after extended trials, a certain practice or proportion of ingredients had been found to give the best results, that practice was absolutely and exactly adhered to, and the common phrase, "Oh, that's near enough!" appeared to have no place in the vocabulary at Krupp's works.

THE GIMLET-POINTED SCREW.—Not many years ago gimlet-pointed screws, such as we have to day, were unknown. The screws of those days were finished off flat at the end, and a hole had to be bored for each screw, so as to permit it to enter the wood. Some of the best inventions the world has known were by lazy fellows; and the gimlet-screw was one of them. A mechanic who was "born tired," and who hated the labor of boring a hole in the wood for each screw, conceived the thought that if the screw were furnished with a little tail end in the shape of a pointed gimlet, much trouble might be saved. At first the manufacture of such screws was attended with difficulties, but machinery to overcome these was in due time invented, and the gimlet-pointed screw is now one of the necessities of the present age.

EXPORT OF LOCOMOTIVES.—The United States is now sending abroad about \$3,000,000 worth of locomotives per annum, the total value of those exported in the last fiscal year being \$2,819,946. This, at an average of \$10,000 each, represented about 290 engines. In the fiscal year ended June 30, 1882, the number of engines shipped did not exceed 133, the estimated value being \$1,455,717. Of the 282 locomotives exported from the United States in 1883-84, 65 went to the Argentine Republic, 49 to the United States of Columbia and Panama, 34 to Mexico, 32 to Brazil, 27 to the Dominion of Canada, 19 to Chili, 14 to Australia, 13 to Central America, 14 to Cuba, 6 to Spain, 3 to San Domingo, 3 to Sweden, 2 to Venezuela and 1 to England.

MACHINE WORK VS. HAND WORK.—An illustration of the advantage of machine over hand work is shown by the fact that quite recently a New York firm sold in Pittsburg, against local Pittsburg competition, some boilers made of steel rolled in Pittsburg, sold through a Boston commission house to a Connecticut manufacturer, and built by these, by machinery. The Connecticut firm has bending rolls which will take in 18" wide; they make the heads by machinery, and do the whole thing by machinery as far as possible.

HOW IS THE BRITISH IRON TRADE TO BE HELD?—An English correspondent of the *American Manufacturer*, under the above head, writes as follows: "This undoubtedly is an inquiry which is forcing itself upon the iron and steel master upon this side, as he is brought face to face with the disagreeable facts which are exercising his mind as he stands in the midst of mills but partially running. He is urged by those who would be his monitors, to bear in mind that 'it is important that we should recognize the fact that the iron trade of Great Britain has had a growth that is remarkable, and it is unlikely that that rapidity of growth can be continued.' 'This little country (it is added) produces not much short of half the pig iron produced in the world. It cannot be expected that that should continue, because other nations will try to produce the iron they need.' In eed (it is continued) 'our foreign trade in some kinds of iron is being trenced upon; we send out much more pig iron than we used to do, but we do not increase the exports of all other kinds of iron as rapidly as we have those of crude iron.' The British iron master has it pressed upon him that he has 'no longer the monopoly of the iron trade of the world,' and moreover, that he 'is never likely to recover the monopoly.' The same correspondent in speaking of the capabilities of the United States for producing heavy steel forgings, says: 'Sheffield, especially, is not pleased with the official report which lays it down that the United States steel masters are qualified to produce all the forgings for guns, and all the plates for armor-clads or forts that the government may need, the more so, as the information as to the report is accompanied with intelligence which seems to point to the United States (government being about to) act upon recommendations of the report. Recent heavy investments in steel plant at Sheffield are threatened in a yet more serious degree, by what our own Government are doing at Woolwich. There the authorities have for some time past been making all their own steel forgings up to 15 tons weight each; and their success is making them anxious to go on to heavier weights. It was largely in expectation of good government orders that the heavy outlays in plant for such work were undertaken in Sheffield."

THE USE AND ABUSE OF TOOLS.—It is proverbial that a manufacturer or an interested man cannot be induced to make correct statements in regard to the performance of a tool or machine. If accurate information is necessary, the proper place to seek it will be found in the repair shop. Those who have the work of keeping a tool in order can sometimes be induced to tell the truth. When in search of information, the scrap heap or the second-hand dealers' shops will frequently prove mines of knowledge. They should always be carefully worked when it is possible to do so. The careful designer studies his worn-out machine with quite as much care as the operator of the new ones. Wear searches out weaknesses which no amount of forethought or circulation would discover.

WIRE BELTS FOR STONE CUTTING.—The principle of continuous motion, as used in the belt saw for wood, which has recently been applied to stone, seems to be fast coming into quite general use. This device, instead of a flat metal band, as in the saw, consists of three steel wires twisted together and run at a very high speed which form the cutting face. Water and sand are applied in the manner usual with the ordinary flat saws for stone. According to *Engineering*, from which we take the above, it is claimed that such saws advance in marble at from 10 to 24 inches per hour, depending upon the hardness of the stone. It is also used for quarrying purposes in dividing up masses of stone which project between recesses in the quarry.

FOR TESTING STRUCTURAL MATERIAL.—Representative Campbell, of Pennsylvania, will introduce a bill of the House Committee on Manufactures, of the Forty-Eighth Congress, to provide for a commission to test structural materials. This bill was once within five of passage, and only failed on account of the absence of some of its most active supporters. As there are many new members in the House, the work will have to be gone over. The friends of the measure might therefore as well put themselves in communication with their Representatives in Congress, so as to insure action at the present session. The measure is a very important one, and should be heartily endorsed and supported by the public generally.

NEARLY ALL SMOKE MAY BE CONSUMED WITHOUT SPECIAL APPARATUS, by attending with a little common sense to a few simple rules. Suppose we have a battery of boilers and "soft coal" is the fuel. Go to the first boiler, shut the damper nearly up, and fire up one-half of the furnace, close the door, open damper and go to the next boiler and repeat the thing. By this method, nearly if not quite all the smoke will be consumed.

STILL LARGER.—Krupp & Co. are now manufacturing four cannons, still larger than any they have yet turned out, and larger than any in the world. Each gun will weigh 120 tons, and will require a charge of 600 pounds of powder, with a projectile weighing one ton. These guns are for the Italian Government, which already owns the most formidable iron clads in the world.

SCIENTIFIC PROGRESS.

NEW KIND OF BRICK.—Messrs. Bleining and Hasselman, two German chemists, have, it is said, recently patented a method for obtaining products that will be more resisting to humidity, etc., than ordinary bricks and tiles. After drying and grinding the clay they make a mixture as follows:

	Parts.
Clay.....	914
Iron filings.....	3
Table salt.....	2
Potash.....	1
Elder or willow wood ashes.....	2

The whole is heated to a temperature varying from 3362 degrees F. to 3632 degrees F. At the end of from four to five hours the argillaceous mixture is run in' o molds, then rebaked in the ovens—always protected from the air—at a temperature of 842 degrees F. to 932 degrees F. The product may be variously colored by adding to the above 100 parts; two parts of manganese for a violet brown, one part of manganese for a violet, one part of copper ashes for a green, one part arseniate of cobalt for a blue, two parts of antimony for yellow, and one and a half parts of arsenic and one part oxide of tin for white. These products resist the action of acids, and are well adapted for sewers, etc.

TELEGRAPHING FROM MOVING TRAINS.—The Phelps' induction system of telegraphing from moving trains will, undoubtedly, prove to become a very valuable invention, and a new and important factor in securing greater safety in railroad traveling. The cost of applying the system is very small, not exceeding \$50 to \$100 per mile, according to the character of the wire used, and the manner of putting it down. The cheapest, and generally a perfectly practical way of adjusting the wires is to support them by insulators upon the ties, about three inches outside and just below the surface of the rail. The coil upon the car which is to take up signals from the line, will be just outside of the wheels. A more expensive way is to place the wire in a wooden box for more perfect protection from accident or breakage, or other interference. Cost, \$150 per mile. The induction can be almost as readily taken up from a wire thus protected, as from a naked wire. The invention has fairly passed from its experimental stage, and is now in process of practical trial. But the introduction of so important an innovation upon existing methods of operating trains, cannot be accomplished hastily, and it will probably take time to bring about its general adoption, even after its entire success has been fully and practically demonstrated.

SAPONIFICATION BY ELECTRICITY.—In 1882, Professor Rotondi presented to the Academy of Sciences in Turin a communication in which he recommended for commercial purposes the use of electricity for the decomposition of concentrated salt solution into caustic soda and chlorine gas. The experiments were confirmed by MM. Rudin and Bidet, and recently Professor Rotondi has renewed and completed his researches, which appear to be of eminently practical importance. With a dynamo machine and diaphragms, the saponification process is easily effected by means of sodium chloride (ordinary salt) and fat. The separation of this resultant products, glycerine, soap, and chlorine gas, offers no difficulty. No caustic soda or potash is thus required for saponification, and the process would be particularly applicable in cases where the chlorine could be at once used for bleaching textile fiber, and where sufficient water power is at disposal. In such works, bleaching and saponification operations might be carried on at night while the motive power is not otherwise required. Professor Rotondi is further engaged in very interesting experiments on the extraction of metals directly from the ores by means of electricity.

MAGNETIZATION OF WIRE.—It has long been known that thin rods of iron and steel, when subjected to external magnetism by means of an electric current circulation in a hollow coil surrounding the rod, are elongated, and the elongation has been very accurately measured. Mr. Shellford Bidwell has, however, found, from recent experiments, that if the magnetization be carried to a certain point the wire no longer lengthens, but begins to shorten again, and retract beyond its original length. This curious discovery has not yet been satisfactorily explained. Nickel rods or wire are known to retract under the same kind of magnetization; but, so far as Mr. Bidwell's experiments went, this contraction did not change into elongation.

ELECTRO-PLATED WOOD. the discovery of which has been recently noted, is coming into use for many purposes, among which are, handles of all kinds, including umbrellas, canes, carving knives, etc. The silver is thrown upon the wood by a process which has proved extremely difficult in practice. The deposit of silver, of course, follows all the peculiarities of the wood, and the ordinary handle is simply garished in most ineradicable silver. The special advantage is in the variety of designs that may be produced.

REFINING TANNIC ACID.—Refining of tannic acid is said to be a newly-established business in this country. A German writer affirms that the whole process consists in mixing tannic acid

with a certain percentage of gum substitute, sieving well and selling. Good tannic acid is quite soluble in methylated spirits of wine, or leaves only a very small residue; gum substitute is not soluble in spirits, it can also be readily detected by this microscope. Some tannic acid contains matter insoluble in spirit, which is not gum substitute; it appears to be the woody part of the galls from which the tannic acid is prepared.

A NEW ATTACHMENT TO THE MICROSCOPE has been devised, the object of which is to observe the melting points of minerals, while under the process of examination. The device is called a "Meldometer," from the Greek word *meltein*, to melt. It consists of an adjunct to the mineralogical microscope, whereby the melting-points of minerals may be compared or approximately determined and their behavior watched at high temperatures, either alone or in the presence of reagents. It consists of a narrow ribbon of platinum, 2 mm. wide, arranged to traverse the field of the microscope. The ribbon, clamped so as to be readily renewable, passes bridgewise over a little scooped out hollow in a disk of ebony. The clamps also take wires from a battery, and an adjustable resistance being placed in circuit, the strip can be thus raised in temperature up to the melting point of platinum. The disk being placed on the stage of the microscope, the platinum strip is brought into the field of a one-inch objective, protected by a glass slip from the radiant heat. The observer is sheltered from the intense light at high temperatures by a wedge of tinted glass, which further can be used in photometrically estimating the temperature by using it to obtain extinction of the field.

COPPER IN THE COLORING OF A BIRD'S FEATHERS.—There is a bird at the Cape of Good Hope noted for its beauty of plumage, especially the rich red upon its wings. This red coloring matter has been analyzed and found to contain nearly six per cent of copper. This mineral must be collected in infinitesimal quantities and eaten with the food. When these birds are kept in confinement and not suffered to have any access to copper they entirely lose the tint which is due to that mineral. Traces of copper have been found in other animals, especially in oysters which are collected near to the mouths of streams which flow from the vicinity of copper mines. In this connection it may be mentioned that the presence of zinc in plants has been repeatedly observed, not only in such as grow near deposits of zinc ore, but also, though in minute quantities, in plants which grow on soil in which not a trace of zinc can be detected.

SULPHUR IN COAL.—M. Duenfleit has been inquiring why there is so much sulphur in stone-coal, and why there is so little of free alkaline carbonates in the ashes. For this purpose he has analyzed the surviving species of the families of the coal plants, particularly the *Equisetaceae*, and has found in them a greater than the usual proportion of sulphuric acid. Hence he deduces, as the answer to his questions, that the coal plants were more highly charged with sulphur than most existing plants, and that for that reason their alkaline constituents assumed the forms of sulphates instead of carbonates.

THE COLORING MATTER OF ROCK SALT.—It is a noticeable thing about natural rock salt crystals, that if they have a bluish or pinkish hue, and be dissolved in water, all the color disappears in the artificial crystals afterward formed by evaporation. Probably the coloring matter is of an organic nature, and is separated by recrystallization. The coloring matter of the quartz crystals known as amethyst, is supposed by geological chemists to be of organic origin. In a collection of minerals, numbering several hundred specimens, many chemical curiosities besides those mentioned are, of course, included.

INDIAN AND EGYPTIAN REMAINS.—Double bitted axes are found in the Indian mounds all over this country. They are made with a groove around the center for lashing onto the handle, with a hole for inserting the helve and with a socket for the same purpose. The double bitted form was used also by the Scythians and Egyptians, and seems to have been the oldest form of this useful tool.

SCIENTIFIC agriculture is making decided progress in this country, and becomes more important every year. Several of the States, among them Ohio, Indiana, Virginia, Georgia, Connecticut, Louisiana, North and South Carolina, Mississippi, Tennessee, have official agricultural chemists, who control or inspect fertilizing compounds, besides making valuable experiments.

MAGIC LANTERN TO GIVE RELIEF IMAGES.—Mr. Crowther employs two converging lanterns and stereoscopic views, but one lantern emits only green rays and the other only red. The spectators are supplied with eye-glasses having one red and one green lens. A slight displacement of the optical axes of the lanterns makes the figures advance or recede.

THE MICROSCOPE describes a pretty experiment. Upon a slip of glass put a drop of liquid auric chloride or argentic nitrate, with half a grain of metallic zinc in the auric chloride and copper in the silver. A growth of exquisite gold and silver ferns will form before the eye.

Passing Events.

The discussion in Washington over the silver question is closely watched by the miners on this coast, and, so far as can be seen at present, the silver men have the best of it.

The discovery of gold-bearing veins in San Bernardino county is another proof that our auriferous region is not thoroughly prospected, and that there is still plenty of room in the gold fields for men to hunt up mines.

The prosecution of deeper work on the Comstock is an event of note of interest to mining men. The hunt for bonanzas at great depth was given up some time since, but now they seem hopeful that riches will be discovered there, and the question is to be again tested.

The mining product of the year shows progress in most directions, the statistics giving evidence that the mining industry is profitable and in good condition.

THE Tucson *Star's* annual review of Arizona gives the following summary: Population, 65,000; head of live stock, 500,000; grain product 74,600,000 pounds; gold dust and bullion, \$282,614; silver bullion, \$2,671,400; ore shipments, \$1,831,500; copper produced, 24,360,000 pounds.

Sulphurets and Sulphuric Acid.

It will be of interest to manufacturers of sulphuric acid, and owners of mines producing sulphurets, to know that Prof. G. Lunge, of Zurich, the great authority on the manufacture of sulphuric acid and soda, has made some valuable calculations, based on statistical data, to show for what purposes and in what quantities sulphuric acid is made in England. These computations are of interest, as they bear directly on the prosperity of the great Spanish pyrites mines and traces the causes which have no mean influence upon that important supply of copper, the metal extracted from pyrites cinder. The following table contains the principal data:

Sulphuric Acid Produced in Great Britain.

YEARS.	Tons.	Tons.	Tons.	Tons.	Tons.
1878.....	447,900	417,406	330,494	124,271	872,171
1879.....	716,625	445,265	271,360	116,884	883,509
1880.....	771,771	501,612	270,159	133,653	905,424
1881.....	730,797	475,724	261,073	115,591	852,306
1882.....	806,703	472,151	334,612	134,742	941,535
1883.....	815,574	484,252	331,322	125,064	940,633

From these tables it is seen that the principal quantity of sulphuric acid is consumed in the manufacture of soda. The ammonia-soda processes, which avoid the use of sulphuric acid, have been looked upon as seriously threatening the pyrites mines by diverting from them their most important customer. It is not now denied that the new processes can produce soda cheaper than the old Leblanc process, but the latter has apparently obtained a new lease of life through the increased value of the hydrochloric acid, formerly a waste by-product, and the substitution of the one method of manufacturing soda by the other is not likely to progress with that rapidity which was not long since claimed for it. The other principal consumer of pyrites acid taking almost all the heavy quantities under "pyrites acid for other purposes," in the above tables, is the great fertilizer industry, whose requirements are subject to wide fluctuations. It strongly illustrates the interdependence of modern industrial and mining industries, that an important source of supply of copper should fluctuate through the intermediacy of two other industries, with the requirements of the farmers of Great Britain and other countries for fertilizers.

Mining Decision.

The Supreme Court of the United States has affirmed the decision of the lower court in the cases of James Joremy and James W. Kennedy vs. James W. Campbell and Elizabeth Dudley, on appeal from the Supreme Court of Utah. The action was commenced in one of the district courts of Utah to determine the rights of the parties to certain mining ground in that Territory. The court, in giving its decision, says: "The question is whether the location of a vein or lode, as running in one direction, but not marked on the surface for years and not developed, will be allowed to cover a claim made by others on ground different from that thus indicated and developed by years of labor and large expenditures, without objection from the complaining parties, because subsequent explorations by the first claimants disclose the fact that their vein runs in a different direction than they supposed and covers the claim of the other parties. We do not think that the original claimants can take the second claim."

In the case of a placer mining application, where judgment of possession had been rendered by a court in favor of the applicant, but the Land Commissioner on further hearing refusing to issue a patent, an appeal was taken to the Secretary of the Interior, in behalf of the applicant, on the ground that after the presentation of the judgment roll the Land Commissioner had no further power or authority, except the ministerial acts of preparing and issuing a patent, the Secretary of the Interior has decided that the judgment roll proves the right of possession only, and the applicant must still make the proof required by the law to entitle him to a patent, and the sufficiency of the proof is a matter for the determination of the Land Department.

The Silver King Mine.

The Silver King is one of Arizona's "show" mines, and has been for some years. The product of hollion has been good, and some of its ore has been marvellously rich. The affairs of the company have moved along quietly the past year—1885—the production of silver, reduced to a gold basis, being \$743,200.44, from which eight dividends, of \$25,000 each, have been paid the stockholders, aggregating in gold \$200,000, still leaving a good strong balance on hand in the treasury, with no indebtedness to provide for. It has been another dry year, and the water supply therefore lessened from natural causes, to remedy which two wells were sunk three miles from Pinal, and the water from them piped to the reduction works, this additional supply being sufficient for all present requirements. The treating of the heavy quartz ore by amalgamation has continued profitable by the new mill No. 2. Mill No. 1 continues, as heretofore, concentrating the porphyry ore at a profit. The work in the mine has been the extraction of ore from the 700, 600 and 500-foot levels, and in keeping all the underground workings, including the shaft, in good condition.

At the annual meeting this week, the superintendent reported that during the past year they extracted 27,160 tons of ore, which have been melted. A peculiarity mentioned in this mine is, that as the sorting of ore in the mine can provide but a portion of the waste rock required to fill vacant ground with, and as it became evident that the filling up of all worked-out ground should progress as closely following extraction as possible, it became necessary to establish a quarry on the surface to supply the deficiency in waste material. The point selected was the north side of the hill in which was sunk the old open ore pit, within 200 feet of the shaft. Since this quarry was opened, just a year ago, 8350 cubic yards of rock have been broken down, and out of this material 17,757 cars have been lowered to the mine levels.

There has been much done in the way of improvement during the year at the reduction works at Pinal. Having been instructed to proceed with the construction and provision of the increased facilities that were under consideration a year ago, the superintendent, Mr. Arthur Macy, removed the tanks and appurtenances of the old lixiviating plant from the south end of the mill buildings, and began the construction of a ten-stamp mill with four five-foot amalgamating pans and two eight-foot settlers, with adjunct crusher-house, containing a "grizzly" and an eight-inch by ten-inch Blake crusher, erected over a dry floor 12 feet by 20 feet, the screened and crushed ore dropping at once to the dry floor, which was placed on a level with the battery feeders. The mill is designed for treating the hardy-quartzose ore unfit for concentration by the method of dry crushing, roast chlorinating and amalgamation. As an auxiliary to the former method of lixiviation three large rotary roasting furnaces, 70 inches diameter by 16 feet long inside the lining, were erected in the mill, and these furnaces are now made use of again in connection with the present method of treatment, as is also a 12-inch by 24-inch Meyer cut-off engine. A bucket elevator and cage hoist are used to handle the battery and roasted pulp. An additional steel boiler 54 inches by 16 feet was obtained to furnish power, and recently another steel boiler of the same dimensions was set in position, replacing the old original boiler. The old lixiviating tanks, 15 in number, were moved to the highest point on the mill premises, set up compactly on framing, two tiers high, and a building 25 feet by 50 feet erected over them. They are now used as receiving tanks for water supply, carrying a ready reserve of 25,000 gallons.

The total amount of ore treated at Mill No. 1 during the year was 21,853 4 100 tons, which has yielded 68 shipments of concentrations, averaging about 11½ tons each, and aggregating 770.3525 tons. The ore shipped was about 3 52-100 per cent of that crushed. The average assay value of the ore, as per daily assays, was \$56.79, and that of the tailings similarly obtained, was \$6.75. Of the silver contents of the concentrations, 48 17-100 per cent was in the form of native silver, 51 83-100 per cent being combined in the various argentiferous sulphides.

With such material as required roasting, the average amount of salt used was 2½ per cent,

and the average chlorination 50 86 100 per cent, the silver being partially in native form. The consumption of quicksilver was 1.69 pounds per ton of ore treated, and the product was 22 bars of hollion of 852 68-100 average fineness.

In August the mill No. 2 was started. Since this mill started 1849 tons of ore have been crushed, of an average assay value of \$67.60, while the average tailings assay was \$9.35. Since the 1st of September, at which time the roaster stack was changed, the average assay value of the tailings has been \$6.72. For the past two months the roaster charges have been running on regular six-hour roasts, with two per cent of salt and an average chlorination of 49.15 per cent. The average of the chlorinations since the mill started was 49.25 per cent. The ratio of native to combined silver is somewhat the same as with the concentrating ore. This product has been 56 large bars of hollion of an average fineness of 703.28.

A little less than a year ago Mr. F. H. Blake, foreman of Mill No. 1, in the entire absence of any available water supply for the further treatment of the tailings from Mill No. 1, experimented upon a device for automatically concentrating them as they flowed directly from the mill. His device was put practically into operation and has been treating the tailings most of the year, with the result of an accumulation of about 1580 tons, having an average assay value of \$31.35 per ton, or a total assay value of \$49,533.

The report of the secretary, Joseph Nash, makes the following showing:

Receipts.	
Balance on hand January 1st.....	\$ 33,008.87
Sales of bullion during year.....	92,550.53
Sales of concentrations during year.....	650,649.91

Balance on hand December 31st.....	106,140.74
	\$776,209.31

Adulterated Paints.

The Master Painters' Association, of this city, made a very sensible move when they resolved to appoint experts to investigate adulterated materials which are being passed off as genuine articles by irresponsible and dishonest workmen. This step was deemed necessary by the association in order to protect architects and property owners. It was further resolved that neither owners, architects nor contractors be charged for such expert services. A resolution was also passed not to employ any journeyman painter who worked for a master painter known to use "slumgullion" or "dope" stock, thereby abusing the confidence of architects and owners.

Everyone who has had any experience in this matter knows that it is difficult to have first-class material used, even when he pays for it. Of course, if people will cut painters down to very low prices for work, they cannot expect to get the best material; but the property owner can seldom tell for some months whether good lead and linseed oil has been used, or potash, fish oil and whiting. The "dope" or "slumgullion", as the painters call it, goes on easily, does not cost much, and looks well enough for a short time. But to have a good job which will last, of course the material must be good.

When an association formed in any one of the trades seeks to remedy abuses in its own line, it really does a good work, and the Master Painters' Association deserves credit for its resolutions. The President of the society also reminded the members that every one was expected to fulfill his contracts. If he did not, the association was pledged to fulfill them and expel the delinquent member. This was the principle of the association, and he hoped everyone present would live up to it so that the name "painter" might be a title of honor and not one of disgrace. The masters issue the following card to every journeyman in good standing:

To any Master House Painter on the Pacific Coast: This is to certify that—has been in my employ— (Signed) —, Master House Painter.

This is a passport to men traveling, and helps them to employment in the best firms, wherever they may travel.

Mountain Railroad Building.

The most famous of the Alpine railroads is the Gotthard, in Switzerland. It was the most difficult one to locate and construct, and is the most interesting one. It has many unique features necessitated by the climatical and elementary condition of the country traversed. A short time since Mr. Geo. J. Specht, vice-president of the Technical Society of the Pacific Coast, read a paper before the society on location and construction of the railroads across the Alps, in which he described many interesting details. Among them are the circular tunnels or loops, on the Northern Mountain division of the St. Gotthard.

Some distance below Erstfeld the railroad ascends along the right side of the valley to Am-

tunnel, is 4840' long, and forms a compound curve of 6° 15' and 3° 30', grade 121' per mile. The tunnel is built for double track. Its construction took two years and nine months.

This tunnel and 2150' of the continued line, with a grade of 137' per mile, have raised the road 167', being now nearly 200' above the bottom of the valley. The road then ascends with a grade of 132' per mile, between the stage road and the steep mountain sides toward the station Wasen, where a second artificial development is necessary. At the village Wasen, the railroad is again near the bottom of the valley, and encounters the second cataract. The railroad crosses the river Reuss, passes through the Wattinger tunnel (second circular tunnel, 3560' long), turning in the same to the right, recrosses the Reuss, runs along the same slope

with a grade of 316' to 528' per mile. The length necessary to overcome this steep section and the one immediately below, was obtained by an artificial development (Fig. 2), necessitating two long circular tunnels, five shorter tunnels, and three bridges across the Ticino. At the end of this development the railroad is 305' lower than at the beginning. The circular tunnel of Freggio, 5130' long, passes through gneiss, rich in quartz, while the rock through which the circular tunnel of Prato, 5102' long, passes, is gneiss micaceous slate. The grade in both tunnels is 121' per mile, and the curves are 5° 50'. They were worked by percussion drills and top-header (65 to 100 square feet) from the lower mouth upward, and by hand labor from the upper entrance. The monthly progress made in the benders varied between 145'

SENATOR STANFORD has introduced a bill granting the State of California five per cent of the net proceeds of the sales of public lands in the State to aid in the support of public schools; also granting California the right to select other lands in lieu of such sixteenth and thirty-sixth sections of public lands, as may be found to be mineral lands, and also providing that in all cases of entries of land under the desert land laws which may be suspended or cancelled the persons entering the lands, upon the relinquishment of their title, shall be entitled to receive back all money paid by them.

CONGRESSMAN McKENNA of this State has introduced a bill to encourage in California the manufacture of material for modern ordnance.

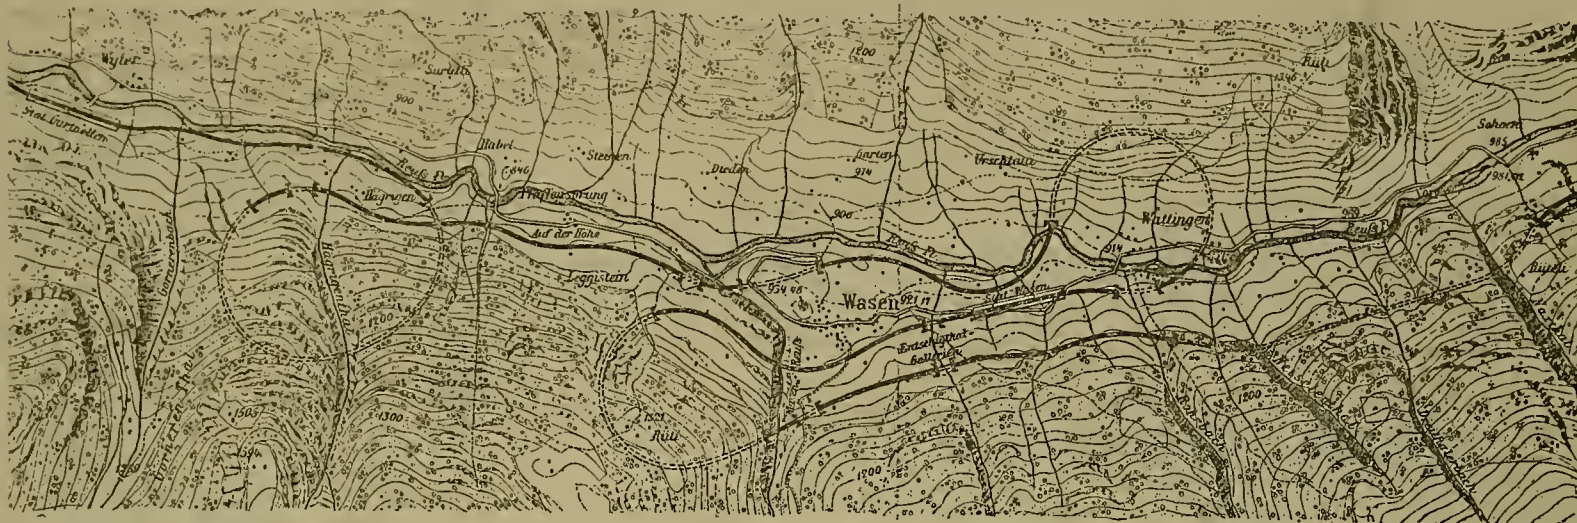

Fig. 1.—THREE CIRCULAR TUNNELS AT WASEN, ON THE GOTTHARD RAILROAD.

steg, passes through a tunnel 593' long, and immediately after over the Kerstelenbach on an iron viaduct. The grade of the road is 137' per mile. Then the line passes under the channels of several very powerful avalanches in two tunnels of an aggregate length of 2014'. The river Reuss is then crossed on an iron bridge. Now the road runs along the left side of the valley,

it ran along before, but in the reversed direction, until it enters the third circular tunnel (the Leggistein tunnel, 3590' long), in which it turns to the left, running again along the same mountain slope on which the lower two lines ran. The lowest and highest part of the line approach each other horizontally about 500', while their vertical difference is 410'. For a

and 230' by machine drilling, and from 65' to 99' by hand drilling. Below the last circular tunnel the road recrosses the Ticino on an iron bridge when the station Faido is reached 885' above the bottom of the valley and 2345' above sea level.

From Faido to Lavorgo the railroad runs near the stage road on the left side of the valley.

The bill creates a board of two army and navy officers and one civilian, whose duties shall be to erect two gun factories, one in California, either at Mare Island or Benicia at a cost not to exceed \$1,000,000 for each foundry.

THE Bodie Free Press says: The Aurora boom will result in the utilization of many

1:25,000.

Fig. 2.—LONG CIRCULAR TUNNELS NEAR DAZIOGRANDE.

passing over several small bridges, tunnels, a viaduct of three spans, a 98.7' span, with two piers of masonry 85.4' high, and another viaduct of masonry with six arches each 33' span. The station Gurtellen is reached next; its elevation above the sea level is 2430'. The line is now near the bottom of the valley; about a mile beyond the station is the first cataract of the Reuss, the Pfaffensprung gorge; the grade of the valley is too steep to be available for a railroad. The difference of elevation between the lower entrance of the Pfaffensprung tunnel and the north portal of the Gotthard tunnel is 1084'; the length of the valley between these points is 27,000', which gives an average grade of 260' per mile. The railroad between these points is 48,200' long, or 26,200 longer than the valley. This length is gained by an artificial development, including three circular tunnels. (Fig. 1.) The first of them, the Pfaffensprung

distance of about 1.6 miles, three lines run nearly parallel to each other in different elevations. Both of the circular tunnels have a grade of 116' per mile and curves of 5° 50'. They were built by hand labor, top header, from 65 to 96.19 square feet large. The main Reuss is crossed twice on iron bridges. The Mayen-Reuss is crossed three times on iron bridges. At the end of this development the railroad is 426' above the bottom of the valley. The dangers threatened by numerous avalanches along this part of the Reuss valley are avoided by building the railroad underground.

Having passed the great St. Gotthard tunnel (which we have not space to describe here) the road passes several stations on the southern mountain divisions to Tiesso, which is at an elevation of 3080'. Then the first cataract of the Ticino valley, the gorge of Dazio, is encountered; the same is very wild; the river falls

between Lavorgo and Giornico the last cataract, the Biaschina, has to be overcome. The grade of the river is 610' per mile. An artificial development (Fig. 3) is again necessary, 2.35 miles long, including two circular tunnels, which are very near each other horizontally. The Piano-Tondo tunnel is 4945' long, and the Travi tunnel 5070' long. The grade in both tunnels is 121' per mile, and the curves are of 5° 50'. The rock encountered is solid gneiss, rich in quartz and feldspar. The top-headers were driven by percussion drills from the lower entrances; average cross-section of header 54 to 65 square feet; monthly progress in each header varied from 164' to 197'. The advance headers from the upper entrance were driven partly by hand labor, partly by machine drilling. Like all other circular tunnels, these were also built for double track, and are lined with masonry for nearly their entire length. This section belongs to one of the most difficult of Gotthard railroads.

thousands of dollars worth of valuable, yet dead stock now in Bodie. Mining interests work curious freaks. In 1878 it was the reverse. The only difference is that the Aurora revival will get the advantage of modern machinery from Bodie, while we got only primitive rackets from there.

It is reported that a San Francisco company will immediately erect on the Gila, about three miles from the Bates, Watson & Co.'s gold mines, Pinal county, Arizona Territory, a 10-stamp gold mill. This will add another to Pinal county's bullion producers, for the properties in question are good in grade and great in quality.

QUICKSILVER is steady at the recent advance. Coal continues in free supply and easy, though the cold weather of the past fortnight has increased the demand for house coals,

PRACTICAL HYDRAULICS.

NUMBER 13. COPYRIGHTED.

PRINCIPLES OF HYDRAULICS.

Written for MINING AND SCIENTIFIC PRESS by P. M. RANDALL.]

With the value of $\frac{c_f l}{r}$ is usually omitted as insignificant; or, more direct, let equation (120) be transposed with respect to v , and $\frac{1}{r}$ be substituted for $\frac{p}{a}$.

$$v = \left(\frac{2 g r \times h_f}{c_f l} \right)^{\frac{1}{2}} \quad (129)$$

Substituting $s = \frac{h_f}{l}$, the sine of slope, CED, in (129),

$$v = \left(\frac{2 g}{c_f} \right)^{\frac{1}{2}} \left(r s \right)^{\frac{1}{2}} \quad (130)$$

Hydraulicians have given different empirical formulas for the determination of the values of c_f . Thus: Weisbach, assuming that the resistance of friction increases simultaneously as the square, and as the square root of the cube of the velocity finds as follows:

$$z = (4 c_f) = 0.01439 + \frac{0.017155}{v} \quad (131)$$

This formula, as claimed by its author, agrees more accurately with observations than do those of the older hydraulicians. In the experiments from which it was derived, the velocity varied from 0.14 feet to 15.25 feet per second, and the pipes from 1.06 inches to 31 inches in diameter.

H. Darcy's formula for velocity, resolved with respect to this coefficient, gives:

$$c_f = .00497554 + \frac{0.0010433}{v} \quad (132)$$

This formula was deduced from very extensive experiments. In these the variation, with respect to velocity, was from 0.29 feet to 16.24 feet per second, and with respect to diameters of pipes, from 3 inches to 20 inches nearly.

Weisbach remarks of this formula, that it "is not sufficiently accurate for small velocities."

J. T. Fanning's "Series of Coefficients of Flow (m)" $m = c_f$ "of water in clean pipes, under pressure, at different velocities, and in pipes of different diameters"—from which the following table is extracted—can be made more simple and comprehensive on this subject than can well be rendered in a single formula. These coefficients are deduced from experiments, in which the variation in velocities was from 0.18 feet to 46.7 feet per second, and in which the diameters of the pipes were from $\frac{1}{2}$ inch to 3 feet.

COMPARISON OF THE VALUES OF THE COEFFICIENT OF RESISTANCES, c_f , AS FOUND BY WEISBACH, DARCY AND FANNING.

Ex. 62.—The velocity, in a clean pipe $\frac{1}{4}$ foot di-

ameter, being 1 foot, what is the coefficient of resistances?

Cal. 1st.—By Weisbach's formula (131), square root of given velocity:

$$\sqrt{v} = 1.$$

Substituting the value of \sqrt{v} in (131), $z = 4 c_f = 0.01439 + \frac{0.017155}{1}$; whence,

$$c_f = .0079. — Ans.$$

Cal. 2d.—By Darcy's formula (132), hydraulic mean radius, $r = \frac{d}{4} = \frac{1}{4}$.

Substituting value of r in (132), $c_f = .0066. — Ans.$

Cal. 3.—By Table 16, from Fanning's series of coefficients, $c_f = .0074. — Ans.$

Ex. 63.—The velocity in a clean pipe 2 feet diameter, being 4 feet per second, what is the coefficient of resistance?

Cal. 1st.—By Weisbach, formula (131), square root of given velocity:

$$\sqrt{v} = \sqrt{4} = 2.$$

Substituting value of \sqrt{v} in (131), $z = 4 c_f = 0.01439 + \frac{0.017155}{2}$; whence,

$$c_f = .0057. — Ans.$$

Cal. 2d.—By Darcy's formula (132), hydraulic mean radius, $r = \frac{d}{4} = \frac{2}{4} = \frac{1}{2}$.

Substituting value of r in (132),

$$c_f = .0052. — Ans.$$

Cal. 3d.—By Table 16, Fanning's:

$$c_f = .0047. — Ans.$$

Ex. 64.—The velocity in a clean pipe 4 feet diameter, being 9 feet per second, what is the coefficient of resistance?

Cal. 1st.—By Weisbach's formula (131), square root of velocity,

$$\sqrt{v} = \sqrt{9} = 3.$$

Substituting value of \sqrt{v} in (131), $z = 4 c_f = 0.01439 + \frac{0.017155}{3}$; whence,

$$c_f = .0050. — Ans.$$

Cal. 2d.—By Darcy's formula (132), hydraulic mean radius, $r = \frac{d}{4} = \frac{4}{4} = 1$.

Substituting value of r in (132),

$$c_f = .0051. — Ans.$$

Cal. 3d.—By Table 16,

$$c_f = .0037. — Ans.$$

Ex. 65.—The velocity in a clean pipe 8 feet diameter, being 9 feet per second, what is the coefficient of resistance?

Cal. 1st.—By Weisbach's formula (131), square root of velocity,

$$\sqrt{v} = \sqrt{9} = 3.$$

Substituting value of \sqrt{v} in (131), $z = 4 c_f = 0.01439 + \frac{0.017155}{3}$; whence,

$$c_f = .0050. — Ans.$$

Cal. 2d.—By Darcy's formula (132), hydraulic mean radius, $r = \frac{d}{4} = \frac{8}{4} = 2$.

Substituting value of r in (132),

$$c_f = .0050. — Ans.$$

Cal. 3d.—By Table 16, from Fanning's series of coefficients,

$$c_f = .0026. — Ans.$$

Weisbach states that his formula for the coefficient of resistance (z) "is founded upon the assumption that the resistance of friction increases at the same time with the square and with the square root of the cube of the velocity." He further says "that the values from newer experiments show that the coefficient of resistance (z) for the friction of water in tubes decreases not only as the velocity (v) increases, but also, although more slowly, as the diameter of the pipe becomes greater." He omits, however, to amend his formula so as to embrace this element.

The coefficient of resistance (c_f in our notation) as deduced from Darcy's formula for velocity, decreases as the diameter of the pipe increases.

An inspection of the results obtained by Darcy's formula for Examples 64 and 65 would show that this diminution practically ceases, when the diameter exceeds 4 feet. Thus, for a pipe 4 feet diameter, the coefficient found is .0051, and for a pipe 8 feet diameter, it is .0050. The results for large pipes, by Darcy's formula, are not in conformity with those obtained by later experiments.

By Table 16, from Fanning's series, the coefficients under the imposed conditions, as seen, are .0037 for a 4-foot pipe, and .0026 for an 8-foot pipe.

It is to be noticed that, in general, the results of later experiments with respect to the velocity of water in large pipes closely approximate those tabulated by Mr. Fanning in terms of the coefficient of resistance. Thus F. P. Stearns, M. Am. Soc., C. E., in a paper read before the American Society of Civil Engineers, October 1, 1884, states that three experiments made with the "Sudbury Conduit," a cast iron pipe 4 feet

diameter and 1747 in length, coated with a coal tar preparation, and in good condition, resulted as follows:

Mean velocity, 4.966 feet.
Mean coefficient of velocity, 142.11 feet.
Mean value of ri , 0.001221 feet.

Substituting the values of the mean velocity here given, $v = 4.966$ feet, and the value of $ri = rs = 0.001221$, in equation (130) and resolving with respect to the coefficient of resistance,

$$c_f = 0.003188.$$

Referring to Table 16, we find the coefficient of resistance corresponding to a velocity of 5 feet (nearest approximate to 4.966 feet) in a pipe 4 feet diameter,

$$c_f = 0.0037.$$

Substituting the value of $c_f = 0.0037$ in Eq. (130), and resolving with respect to the coefficient of velocity, c , as employed by Mr. Stearns, there results: $c = 131.9$, as compared with 142.11.

Mr. Stearns further states, in the paper referred to, as follows:

"The experiments of Hamilton Smith, Jr., M. Am. Soc., C. E. (transactions for April, 1883), give curves of coefficients for pipes up to 30 inches diameter. Extending these curves would give for a 48-inch pipe, with velocity of 5 feet per second, a coefficient of 128, as compared with 142.1 above."

"The experiments of S. N. Tubbs, M. Am. Soc., C. E., on pipes of 2 and 3 feet diameter, would give by extending the curves a coefficient about the same as that in the average above."

"The experiments of Dr. Lampe, at Danzig, give results somewhat higher than those of Mr. Hamilton Smith, Jr."

The formulas applied to Example 3, to find the values of the coefficient of resistance for a 3-inch pipe, give by

Weisbach, $c_f = 0.0079$.
And by Darcy, $c_f = 0.0066$.
The value by Fanning is $c_f = 0.0074$.

We thus perceive concerning the values of this coefficient for small pipes, that Fanning differs less than 7 per cent from Weisbach, whose experiments were confined, as hitherto shown, to this class of pipes, while Darcy differs nearly 20 per cent from him. It must not be understood, however, that these differences obtain to the same extent in estimating the velocity. Reference to Eq. (130) shows that the coefficient of velocity depends not upon the direct value of the coefficient of resistance, but upon the square root of it. So that in estimating the velocity or quantity of flow, the real difference, in the case cited, between the results of Weisbach and Fanning would amount to only about $\frac{1}{3}$ per cent.

INTERPOLATION IN TABLE 16.

The general formula of Darcy furnishes a simple means of interpolation with respect to the coefficients of resistance, when the difference between the extremes is not large. Thus the general formula is:

$$c_f = m + \frac{n}{r}, \quad (133)$$

In which r represents the mean hydraulic radius m and n auxilliary numbers whose values are determined by substituting the tabulated values of r and c_f in (133) between which latter intermediate values are sought corresponding to different values of r' . The values thus found for m and n are employed as constants in the determination of these intermediate values of c_f .

For example, the velocity of flow being 3 feet per second, let it be required to determine the values of c_f due the diameters 30, 36, 42 and 44 inches, between 24 and 48 inches.

The hydraulic mean radii of 24 inches and 48 inches, are respectively $\frac{3}{4} = \frac{3}{4}$ and $\frac{4}{4} = 1$. By Table 16, the value of c_f due a pipe 24 inches diameter is .0048, and that due a pipe 48 inches diameter is .0038. Substituting these values of r and c_f in Eq. (133), there results:

$$m + 2n = .0048, \quad (134)$$

$$\text{and } m + n = .0038. \quad (135)$$

Subtracting (135) from (134),

$$n = .0010. \quad (136)$$

Substituting value of n of (136) in (134),

$$m = .0028. \quad (137)$$

The hydraulic mean radii corresponding to the given intermediate diameters, are respectively $\frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{8}$ and $1\frac{1}{2}$.

Substituting the values of $m = .0028$, $n = .0010$, and $r = \frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{8}$ and $1\frac{1}{2}$ in (133), there results for the given diameters:

$$30", c_f = .0028 + \frac{.0010}{\frac{5}{8}} (.0010) = .0044, \quad (138)$$

$$36", c_f = .0028 + \frac{.0010}{\frac{3}{4}} (.0010) = .0041, \quad (139)$$

$$42", c_f = .0028 + \frac{.0010}{\frac{7}{8}} (.0010) = .0039, \quad (160)$$

$$44", c_f = .0028 + \frac{.0010}{1\frac{1}{2}} (.0010) = .0039, \quad (141)$$

to be interpolated as required.

*This series of articles will shortly be published in book form by Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS, 252 Market St., S. F. Subscriptions for the book will be filled in the order in which they are received.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COMBINED WARDROBE AND TRUNK.—C. Lempert, Jacksonville, Oregon. No. 333,238. Dated Dec. 29, 1885. This combined trunk and wardrobe consists in various details of construction by which the trunk is adapted to be readily converted into a wardrobe, and the wardrobe reconverted into a trunk as desired.

FARE BOX.—F. O. Landgrane and Milton E. Willis, S. F. No. 333,233. Dated Dec. 29, 1885. This is an improvement in fare-boxes such as are employed upon street cars, and it consists in a means for preventing the abstraction of money or fares after they have been placed in the box. This box is so arranged that no straps with adhesive substance can be used to abstract fares, nor can the money be removed by reversing the box.

STANDARD FOR MAPS AND CHARTS.—John S. Fox, Oakland, assignor of one-half to J. P. Garlick, No. 333,211. Dated Dec. 29, 1885. The device is intended for conveniently supporting and exhibiting maps, charts, or similar articles. It consists of a vertically-extensible standard, with a clamping device, an arm pivoted at the top, so that it may be made to stand either vertically or transversely, with a means for retaining it in position, and adjustable clamp-supports or hangers, by which the map or chart is suspended from the bar.

MEANS FOR THE PROPULSION OF VEHICLES OR CARS.—F. O. Landgrane, Marx P. Schetzel and M. E. Willis, S. F. No. 333,234. Dated Dec. 29, 1885. This consists of an endless traveling platform-belt, which is so constructed that a horse or other animal may travel upon said platform, and this is carried by the car or vehicle to be propelled, having a means of communicating power from it to the traction wheels, means for increasing or decreasing the power, according to the grade or road, and also a means for increasing or decreasing the angle at which the platform is supported, together with certain details of construction.

INCANDESCENT ELECTRIC LAMP.—August Harding, Oakland. No. 333,219. Dated Dec. 29, 1885. This is of that class of electric lamps in which a continuous carbon-conductor is heated in a vacuum to incandescence. In this there is a peculiar air-tight joint between the globe and base of the lamp. In lamps of this description it is usually the case that when the carbon-conductor is destroyed by use or accident the lamp is useless. Then, again, in order to exhaust, the lamp glass tubes in some cases are attached to the globe, and finally, a perfect vacuum is not obtainable by reason of the failure to expel all occluded gases. The object of Mr. Harding's invention is to overcome these difficulties by constructing a lamp, the globe of which can be readily separated from the base, and the carbon-conductor replaced without injury to any of the parts of the lamp, and further, by so making the lamp as to adapt it to become subject to the peculiar means employed to expel the occluded gases and to fit its parts together within an exhausted chamber, whereby it is itself thoroughly exhausted.

CODLIN MOTH TRAP AND TREE PROTECTOR.—George W. Thissell. Winters, Yolo county. No. 333,265. Dated, Dec. 29, 1885. The tree protector is so constructed as to encircle the tree, and is provided with apertures through which the insect in its larval state passes, and, when developed, cannot return. A perforated chamber surrounds the tree; and layers of fabric are wound around the trunk inside the chamber. There is also a seal of wax in the bottom and top of the chamber. Several patents have been granted to this inventor, and this one covers an improvement on the trap previously patented. The operation of the trap is as follows: The larva, seeking hiding places to escape from the ravages of birds and insects, enter through the perforation of the casing or chamber. They prefer to get as near the bark as possible and finding the folds of fabric around the trunk secrete themselves in it and spin their cocoons, in due course of time passing through the chrysalis state and developing into moths. As larvae they do not wish to leave the trap; but as moths they cannot escape because the holes through which they enter as larvae are too small to permit their egress as moths. They soon perish without laying eggs as they only lay them in the fruit. Cotton and old rags were formerly used around the tree inside the trap, but Mr. Thissell finds cotton is not good for this purpose, nor is the indiscriminate use of old rags; but he finds that the wrapping of the tree with the fabric such as gunny sacks are made of, is a much better inducement for them. The chamber is made now of a double conical shape, with holes all over the surface, entrapping those that come from above or below. The trap is placed at any point above the ground without touching it, as is usually done when cylinders of wire gauze are used. This gives a bottom for the trap and allows the larva to come in contact with the tree before reaching the trap, which they are more likely to enter after being on the tree. The wax seal prevents them getting out at these parts. This trap is more easily arranged and more effective than those previously patented by this inventor.

USEFUL INFORMATION.

TREATMENT OF OLD ZINC.—According to the *Revue Industrielle*, a new method has been introduced by M. Piallat for dealing with the clippings, shavings, turnings, and other forms of waste zinc resulting from various manufactures. The value of these forms of old zinc is very much lower than that of new zinc, because there is always an amount of solder present, which spoils the zinc for rolling and for most other direct uses. The difference in value is so considerable that M. Piallat considered the subject of treating this zinc debris to be well worth study and experiment. It is stated that he has fully succeeded in making a very profitable success of his labors. He places the zinc cuttings, etc., in a sort of basket, in which they can be subjected to heat and to centrifugal force at the same time. The actual basket-like container is surrounded by an outer envelope. Superheated steam or heated air can be used, and the temperature regulated as desired. Under the influence of the heat and the centrifugal action, the solder is melted, detached from the zinc, and driven to the exterior of the container, where it collects and is drawn off. The solder thus collected is remelted and cast into bars. It is stated that the value of it alone will pay all the costs of the operation. The zinc remaining after this operation is further purified by fusion. It is then very suitable for use in making small castings, and can be sold at lower prices than the brands of zinc that are now specially in use for this purpose. This branch of trade is stated to be of considerable importance, great quantities of zinc being used in Paris alone for casting figures and for clock-making. M. Piallat estimates that one of his machines, working ten hours a day, can extract the solder from three tons of old zinc. This amount of purified zinc will be too great to be all disposed of for casting purposes, and so the remainder is to be rendered pure and soft enough for rolling into sheets. It is stated that M. Piallat has also found a method of purification far superior to any in ordinary use, and producing a better quality of metal than any on the market; but this method is kept a secret at present.

PERCENTAGE.—The reckoning of percentages, like the minus sign in algebra, is a constant stumbling block to the novice. Even experienced newspaper writers often become muddled when they attempt to speak of it. The ascending scale is easy enough. Five added to 20 is a gain of 25 per cent; given any sum of figures the doubling of it is an advance 100 per cent. But this moment he change is a decreasing calculation the inexperienced mathematician betrays himself, and even the expert is apt to stumble or go astray. An advance from 20 to 25 is an increase of 25 per cent; but the reverse of this, that is, a decline from 25 to 20, is a decrease of only 20 per cent. There are many persons, otherwise intelligent, who cannot see why the reduction of 150 is not a decrease of 100 per cent, if an advance from 50 to 100 is an increase of 100 per cent. The other day an article which had been purchased for 10 cents a pound was resold at 30 cents—a profit of 200 per cent; thereupon, a writer in chronicling the sale said that at the beginning of the recent depression several invoices of the same class of goods, which had cost over 30 cents per pound, had been finally sold at ten cents per pound—a loss of over 100 per cent. Of course, there cannot be a decrease or loss of over 100 per cent, because that loss wipes out the whole of the investment. An advance from 10 to 30 is a gain of 200 per cent; but a decline from 30 to 10 is a loss of only 66 2/3 per cent. The *New York Sun*, says the journal from which we quote, prides itself on the exactness and purity of its style, and indulges in frequent criticisms of its contemporaries; but in its description of the recent great orchid sale, it affirms that "some of the higher-priced plants brought 150 per cent less than had been paid for them." Of course, if nothing was realized from them the loss would only be 100 per cent less than they cost.

METHOD OF DEADENING SOUNDS IN BUILDINGS.—General M. C. Meigs writes to the *Sanitary Engineer* as follows in reference to an article on deadening the sounds, which appeared in a late issue: "I have found it impossible to make myself heard by a person on the other side of a large window, double glazed, interval between panes seven-eighths of an inch. Glass is very elastic, and should, I suppose, therefore, be a good sound-conductor. But the voice cannot be heard through two sheets of ordinary French window-glass separated by seven-eighths of an inch of air. In this, I think, may be found a hint for shutting off sound."

ANCIENT LEAD PIPE.—The Romans appear to have been acquainted with the use of leaden pipe, although they had not the appliances for falsifying any of large dimensions, or sufficiently strong to withstand pressure from the fountain head. In the museum at Cherchel is a piece of lead piping made by rolling a sheet of metal, turning the edges over, and then running molten lead along the joints.

ELECTRIFIED PAPER.—A sheet of ordinary paper warmed in front of a fire, will in a dark place, give a very decided electric spark upon the application of the knuckle, with a crackling

sound. Place a sheet of gold leaf between two sheets of paper thus electrified, and pass a pencil point over them in a zigzag course, and a luminous flash, quite strong, will appear.

THE EFFECT OF AGE ON THE QUALITY OF CEMENT.—It is quite generally understood that hydraulic cements are more or less deteriorated by age, unless they are kept in an especially dry atmosphere. The *Manufacturer and Builder* refers to this matter as follows: It has been ascertained from practical experience with hydraulic cements (of which we may take Portland and Rosendale as typical examples) that they gradually deteriorate in setting and hardening qualities by age, even when kept in dry situations. The material gradually absorbs moisture (even from the driest atmosphere) and carbonic acid, and chemical changes take place in it analogous to those which take place when it is made into mortar for use. The longer the cement is kept the greater will be the extent of these changes and, consequently, the greater the extent of the deterioration. Ultimately a cement may become quite useless from these causes. As was lately pointed out in one of our contemporaries, however, a certain amount of air slaking is beneficial to certain qualities of Portland cement, as will appear from the following extract: "Portland cement, especially when underburnt, very frequently contains an excess of free caustic lime, which, when the cement is used immediately after its manufacture, causes it to swell very considerably, and sometimes destroys the masonry in which it is used. To avoid this very common danger, the English architects and engineers usually open at once the bags of Portland cement sent from the manufactory to the work, and empty the contents on the floor of a room, leaving them there exposed to the air, and perhaps turning them occasionally, for about a month before use. The dry cement, if fresh, swells under this treatment, from evaporation of the particles of caustic lime. When it has become so far air-slaked that a little of it, made into a stiff paste with water and put into a bottle, will not expand enough to burst the bottle, it is considered to be in proper condition for making mortar. If the air-slaking is carried beyond this point, the cement powder gradually loses its power of setting, and at last becomes as inert as so much fine sand."

HARNES BLACKING.—Somebody has found in an "old scrap book" the following receipt, which, it is said, will give a beautiful polish: Two ounces white wax and three ozs. of turpentine are to be dissolved together over a slow fire; then add one oz ivory-black and one drachm indigo, to be well pulverized and mixed together. When the wax and turpentine are dissolved, add the ivory black and the indigo, and stir till cold. Apply very thin and brush afterwards.

PREFERENCE IN COLORS.—Many kindergarten teachers agree that the first choice among colors of all children under seven years is yellow. This admits of few exceptions.

WEIGHT OF PATTERNS TO IRON USED.—In making patterns for iron castings, the iron in pounds is equal to the same weight of pine in ounces.

GOOD HEALTH.

Gaslight and Ventilation.

The subject of the ventilation of rooms in which common gas is ordinarily used, says *Popular Science*, is beginning to attract attention. It is stated upon scientific authority that a jet of common gas, equivalent to 12 sperm candles, consumes 5.45 cubic feet of oxygen per hour, producing 3.21 feet of carbonic acid gas, vitiating, according to Dr. Tidy's "Hand-book of Chemistry," 348.25 cubic feet of air. In every five cubic feet of pure air in a room there is one cubic foot of oxygen and four of nitrogen. Without oxygen human life, as well as light, would become extinct. It is asserted that one common gas jet consumes as much oxygen as five persons.

Carbonic acid gas is the element which in deep mines and vaults causes almost insensibility and suffocation to persons subjected to its influences, and instantly extinguishes the flame of any light lowered into it. The normal quantity of this gas contained in the air we breathe is .04; one per cent of it causes distress in breathing; two per cent is dangerous; four per cent extinguishes life, and four per cent of it is contained in air expelled from the lungs. According to Dr. Tidy's table, each ordinary jet of common gas contributes to the air of a room 16 by 10 feet on the sides, and nine feet high, containing 1440 cubic feet of air, 22 per cent of carbonic acid gas, which continued for 20 hours without ventilation, would reach the fatal four per cent.

In addition to the consumption of oxygen and production of carbonic acid by the use of common gas, the gas itself, owing to defectiveness of the burner, is projected into the air. Now, considering the deleterious nature of all illuminating gases, the reasons for perfect ventilation of rooms in which natural gas is used for heating and culinary purposes are self-evident, not alone as a protection against explosions, but for the health of the occupants of the house, remembering that a larger supply

of oxygen is said to be necessary for the perfect combustion of natural than of common gas.

Carbonic oxide, formed by the consumption of carbon, with an insufficient supply of air, is the fatal poison of the charcoal furnace, not infrequently resorted to, in close rooms, as a means of suicide. The less sufficient the air toward perfect combustion, the smaller the quantity of carbonic acid, and the greater the amount of carbonic oxide. That is to say, at the time of ignition the chief product of combustion is carbonic oxide, and, unless sufficient air be added to convert the oxide to carbonic acid, a decidedly dangerous product is given off into the room. Yet, by means of a flue to carry off the poisonous gases from burning jets, the combustion of gas, creating a current, is made an aid to ventilation. Unfortunately, this important fact, if commonly known, is not much heeded by heads of families or builders of houses.

WHITE OF EGG IN OBSTINATE DIARRHŒA.—From a German paper we learn that Celli has recently called attention to the curative properties of the albumen of hens' eggs in severe diarrhœal affections. In a discussion before a medical society at Rome he advocated its use, and related two cases of chronic enteritis and diarrhœa which, having resisted all treatment, speedily made complete recoveries under the use of egg albumen. The same diet is strongly recommended in the diarrhœa accompanying febrile cachexia, and in that of phthisis. In two cases of diarrhœa dependent upon tertiary syphilis, it was found of no avail. On post mortem examination diffuse amyloid degeneration of the arterioles of the villi was found in these cases. The whites of 8 or 10 eggs are beaten up and made into an emulsion with a pint of water. This is to be taken in divided quantities during the day. More may be given if desired. The insipid taste can be improved with lemon, sause or sugar. In case of colic, a few drops of tincture of opium may be added.

TREATMENT OF A FELON.—We give the following for what it is worth, from a correspondent of the *Michigan Farmer*: "I wish to tell those who may suffer from that terrible scourge, felons, of a painless remedy that will effect a perfect cure in 24 hours, as I have had occasion to prove within the last three days. A lady came here, who had been suffering over two weeks, with a felon on the end of her middle finger. I saturated a piece of wild turnip, the size of a bean, with spirits of turpentine and applied it to the affected part. It relieved the pain at once. In 12 hours there was a hole to the bone, and the felon was destroyed. I removed the turnip and applied healing salve, and the finger is well." If there is any virtue in the above, we presume any other convenient carrier for the turpentine will answer as well as wild turnip.

EFFECTS OF LIGHTNING ON THE HUMAN BODY.—A person struck by lightning does not know it—the fluid being much quicker than thought. The nerves which convey pain are rather slow in their power to convey information. Stick a pin in the tail of an elephant and quite a perceptible interval occurs before the noble animal gives his opinion of the man or boy at the end of the nervous system on trial. Lightning does its work before the victim knows anything. Two men were struck while taking refuge under a tree. Both were carried into the house and laid out for dead. One of the men revived, and after weeks of suffering and infirmity, has got out again and is still living. He said that he knew no more about having been struck by lightning than he was conscious of having lived before the flood. It was all news to him when told of the fact.

VACCINATION.—Here is an item to which the attention of Mr. Bergh and those who act with him in opposing vaccination is invited. It comes from Montreal, Canada, in the form of a telegram, dated December 26th: Yesterday, for the first time since smallpox became epidemic, there were no new cases of the disease reported. It is a remarkable fact that, although there have been over 300 persons employed by the health department as sanitary police, isolated police, hospital nurses, and in other capacities, not one of them contracted the disease. As a matter of course, they were all vaccinated.

HOW TO USE MILK AS FOOD.—Milk when swallowed rapidly by the glassful is very unwholesome. A quantity entering the stomach at once is changed from a fluid, by the acid juices of that organ, into a hard, cheesy curd, through which the gastric juices cannot pass; it is turned over and over, and as its surface only can be reached, it digests very slowly. It is sometimes fatal to a weak stomach. It should be taken slowly, eaten with something else, or sipped by the spoonful.

TO RELIEVE TOOTHACHE.—Dr. J. R. Irwin says that one of the best and most pleasant things that can be used to relieve toothache is chewing cinnamon bark. It destroys the sensibility of the nerves and suspends the pain immediately, if the bark is of good quality.

STOPPING HICCOUGH.—A Brazilian physician, Dr. Ramos (Gen. Therap), states that refrigeration of the lobe of the ear will stop hiccough, whatever its cause may be. Very slight refrigeration will answer, the application of cold water, or even saliva, being sufficient.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

WORK STARTED.—Amador Ledge, 9: Work was started on the Green Aden or New London claim, near Plymouth, last Monday. The fine hoisting machinery on the abandoned claim, near Enterprise, is to be removed to the recent purchase as speedily as possible. H. C. Farnham has also been awarded a contract for the supply of timbers and lumber. Everything indicates a vigorous development of the mine. Work at the San Joaquin, commonly known as the Tellurian, near Pine Grove, has been temporarily suspended until pumping machinery can be erected. The shaft has been put in good condition to the depth of 200 feet, to which depth it is drained by a tunnel. Beyond this work cannot proceed until facilities for controlling the water are provided. The pump is expected to be in running order inside of a month. The big tunnel at Middle Bar is now in a distance of 2800 feet; the header is advancing at the rate of about five feet per day, and is still in hard country rock, with small stringers of quartz occasionally met with. Nine hands are employed. The Mammoth mill, which has been running on half time for some months past, is again running day and night. The discovery of a fresh ore body in the upper tunnel has led to this gratifying change. The mine and mill give employment to 15 men. At the Moore everything continues to look favorable. An elevated track is being constructed for the purpose of running the ore to the mill, and the mill is otherwise being put in readiness for starting. There is a large quantity of ore on the dump ready for crushing, all apparently of good average grade and showing considerable free gold. Stations are being opened at the 300-foot level, and when this work is completed it is probable that the shaft will sink another hundred feet. From the dimensions of the ledge and the live character of the ore, it is the universal opinion that inside of a year the Moore will have a 40-stamp mill in successful operation, and be giving employment to 100 men. At the Kennedy the water-power hoisting works are receiving the finishing touches, and will no doubt get fairly started in a few days. It is thought that it will take until April to free the mine of water.

Calaveras.

MILL.—*Mr. Echo*, Jan. 9: The new mill now in course of construction on the Tozer mine, will be completed and ready for crushing ore in three or four weeks. A rich strike has been made in the Jackrabbit mine at Dogtown. Paving gravel has been struck in the Bully Bully mine in Dogtown. It is the intention of the owners of the Stickle mine to have their new twenty-stamper completed in a few weeks. Then look out for big results.

El Dorado.

SPRINGFIELD MINE.—*Placerville Observer*, Jan. 9: The new shaft on the Springfield mine, which is intended to intersect the ledge at a depth of 1500 feet, is now being rapidly sunk toward the 1200 foot level. The permanence and immense richness of the lode has long since been established. Other mines in that vicinity are being developed, which promise to equal the Springfield in stability, and prove that mining district to be the richest in the State. Esperanza mine, after having been shut down for a number of years, was started up last week. N. D. Burlingham some time since commenced work of re-opening, and by persistent, indefatigable labor, put the mine into such a state of development that enabled him to bond it to San Francisco capitalists. He has now taken a contract to sink 200 feet. The mine looks and prospects well, and promises large returns in the near future. A force of six men are at work in the Buckeye mine, Texas Hill, on shares, and are highly elated over the prospects for a fine cleanup. Mr. Stevens, owner of the mine, furnishes everything, including the working of the gravel, and divides equally with the men who do the work. The main tunnel at this mine is in over 600 feet, and has paid from the first. We have it from good authority that the Bright Hope mine, owned by H. W. Hulbert, editor of the Georgetown Gazette, and A. D. Gibbs, is in a fair way to develop into one of the best and most permanent mines in the county. Mr. Hulbert has devoted two-thirds of his time to working and developing the mine, while his good wife assisted in publishing the paper. Parties who are now negotiating for the purchase of this mine, we learn, made an offer of \$10,000. However this may be, there certainly is enough ore in sight to amply compensate Mr. Hulbert for his patience, toil and expense.

THE SLATE MOUNTAIN MINE.—*Placerville Observer*: In El Dorado county there is at the present time great mining activity, and especially is this true of the Georgetown divide, where quartz interests are brightening very materially, and many mines are being worked successfully. The one that is attracting the attention of mining men and the people generally is the Slate Mountain mine, owned by Benjamin & Zombro. This mine is located on Slate mountain, and is in a locality that was prospected to a considerable extent at one time; but as new discoveries were made in other districts, just so fast were the diggings deserted to a degree, and for a time but little work was done there. During the past year the locality has again come into prominence, and great interest is manifested in the development of the Slate Mountain mine, and the richness of the ore taken therefrom. The mine is running at full blast, employing in all about 20 men. They have just completed sinking a shaft, and are now running levels and stoping. At the 200-foot level the ore body is four feet wide, and is far richer than any previously taken out. In fact, the ore is of the specimen quality, many of which are now on exhibition at Georgetown. The adjoining mines on the south—the southern extensions—owned by the Grover brothers, are prospecting well, and as much is expected from these as has been derived from their neighbor.

Inyo.

THE POLETA.—*Register*, Jan. 9: Supt. George Storey has this week been putting additional men at work in the Poleta mine, which action means something encouraging.

MINE SOLD.—*Independent*, Jan. 9: The Chulula

mine, at Beveridge, has been sold to San Francisco parties, Mr. Preston was the buyer, Hario Arambula the seller.

Nevada.

AMONG THE MINES.—*Foothill Tidings*, Jan. 7: After a very careful search among the mine owners, that is those of them we could find, we give the following items as the result of our travels: The Gold Point mine, located southeast of the Idaho, has recently purchased the Halphen ground, joining the property, from Weissbein Bros. The shaft on the Gold Point has reached a depth of 130 feet, with a drift 250 feet north. In this drift there is a good ledge of gold bearing ore. The ledge averages two feet in thickness, encased in smooth walls, and can be easily worked. The company are now making preparations for putting up a 10-stamp mill early in the summer, and water power will be easily obtained for running purposes. The style of wheel to be used in the mill has not yet been decided upon. The Empire mill is kept running day and night upon ore from the 8, 10, 11 and 15 hundred foot levels. The rock is first-class for milling and the sulphurets are rich. The Empire has what is considered to be a model quartz mill, and the 20-stamps now running will soon be reinforced by 20 more. The carpenters and millwrights, under the direction of Mr. Wm. Body, are rushing the work with all possible diligence in order to get the ground under cover during this fair weather so that there will be no delay in placing the batteries. The Empire is the oldest worked mine in the district. The North Star mine has now on hand 4000 tons of good ore ready for the mill. The shaft is still being sunk, and is 150 feet below the 13 level. The 14 level will soon be opened up. The general appearance of the mine is entirely encouraging. At the last crushing of ore from the North Star the rock yielded \$60 per load in gold, without sulphurets, the latter being worth \$60 per ton after concentration. The Magenta company is still sinking the shaft and it is now down to a depth of 400 feet. There is very little trouble in handling the water in the Magenta mine, as a 6-inch pump does that work very readily. The Magenta joins the Empire mine, and from its ledge some of the richest ore ever seen in this district has been extracted. The mine has scarcely begun to be prospected.

THE BADGER.—The Idaho company has let a contract for running a ditch to convey water to the Badger Mining Company's property. Men are already at work upon the ditch. Work will be begun upon the Badger as soon as the new by-laws can be adopted. There are any number of demands for stock in this claim. A prominent and wealthy mining man of Grass Valley, several days since, told the owner of the Badger that he would take 5000 shares in the new company, and several days ago that same man authorized the manager to put him down for 10,000. Mr. Peter Johnston is constantly receiving letters inquiring about the possibility of obtaining stock in the Badger. The Phoenix Co. is running the north and south drifts ahead as fast as possible. The ledge in the drifts is 10 inches in thickness, and gold can be plainly seen in much of the quartz, while sulphurets of a high grade are plentiful in all of the ore. Stoping will be commenced in a few days, and soon a crushing will be taken out. The Phoenix is working 16 men. The New York Hill Co. is diligently driving the drift north in the 1300-foot level. There is a very rich ledge in the No. 10 drift south, but the ledge is small.

THE IDAHO.—This famous mine, "the world beater," as it is sometimes called, is looking well in the lower levels, and the 1700-foot level will be reached at no distant day. The Idaho has already paid over \$3,000,000 in dividends, besides giving constant employment to a large number of men. On Monday last the company declared their 195th dividend, the amount being \$3 per share on the capital stock.

The Crown Point is still working, and has been bonded for \$35,000, the entire amount to be paid in 100 days. The mine has been very rich from the beginning, all the ore being of good milling quality, with an occasional \$1000 or \$2000 worth of specimen ore taken out at a single blast. North Banner is still at work on the bottom drift, which is now in about 900 feet, showing a 4-inch ledge, rock from which is now being taken out for the purpose of being tested. Mr. John Skewes is superintending this mine, and four men are working in it on tribute. The Horse Shoe Company is now in a good ledge at the bottom of the shaft, and has let a contract for sinking the shaft 50 feet deeper. A tank is being placed in the shaft to catch the surface water. It is expected that the contract will be completed in about six weeks. Lone Tree shaft is down 12 feet below tunnel level, with a 2½ foot ledge in the bottom. Timber is already on the ground for the purpose of building a whim. As yet the company have had no water to bother them, and have taken out about 12 loads of ore, which will soon be crushed. J. G. Cohoe, a miner of experience and ability who has lately been operating in Nevada State, is now the superintendent of the Lone Tree, and he is pushing work ahead in good shape.

Plumas.

INDIAN VALLEY MINE.—*Greenville Bulletin*, Jan. 9: The "clean up" at this mine the first of the week was very satisfactory—better than expected. The drift from the bottom of the shaft east is now in 50 feet on the ledge, which maintains its width and good quality of ore. The pumps have been lowered for the sinking of the shaft. The Burleigh drills will be started this week, one in the shaft, one in the level going east, and another in the drift running toward the old Union mine.

San Bernardino.

GOLD EXCITEMENT.—*Cor. Calico Print*, Jan. 10: Your occasional correspondent visited a few days ago the New Eldorado. I can give no adequate idea of the extent of the new discoveries of gold in ledges. Gold has been found for eight miles in the south end of Providence mountain from what is known as Voshay Pass, the principal find being about three miles north of Granite Pass. I send a specimen from one of the small ledges to Mr. Van Briesen of your town who will no doubt show it to any person desiring to see it. There is one immense ledge running through the camp for about two miles, there being eight locations on it. The width of the ledge varies from 20 to 100 feet and is the best defined ledge that your correspondent ever laid eyes on. It is so far as ascertained marvelously rich. I have seen a number of assays ranging from \$50 to \$650 and as it looks

now it bids fair to be the largest gold mining proposition on the coast. There is a large quantity of small veins very rich, several good practical miners are chloriding with splendid results so far as can be ascertained by assays. The Mexicans who first discovered the mines are now shipping to tons of ore to Kingman and I understand some others will ship ore shortly. The Mexicans have picked from their shipping ore some two or three sacks of specimens which they would not take \$2000 for. I saw one of them horn out of two pounds of rock three ounces of gold. The new district was formed on the 9th of December, and is called the Arrow Mining District. I presume because it is only five miles from Arrowhead Springs. Mr. Sam King was elected recorder. The mines are situated about 16 miles south of Providence, and are only about 20 miles from the Atlantic & Pacific R. R.

Shasta.

WHISKEYTOWN.—*Shasta Courier*, Jan. 9: J. S. Strode has been crushing good ore for the past few weeks. He is now awaiting the arrival of some machinery when he will again set his mill in motion. Jackson Ferguson is developing some fine mining property on Mad Ox. He has a large ledge and plenty of good ore in sight. Foster, Heft & Co. have completed their contract for L. C. Graupner & Co. on their quartz mine on Whiskey creek. They have now a permanent ledge and a good prospect. O. P. Woodward has again turned his attention to quartz. He has a good prospect and if it holds out a fine bonanza will be uncovered.

IGO.—Jutton & Co. have finished crushing the Chicago ore at the mill, the returns from which have proved quite satisfactory, considering the price of silver. The concentrator has been shipped to Tuolumne Co., where it is to be used in a gold quartz mill. F. Shirland & Co. are preparing to run some surface silver ore through at the Chicago mill. Robinson & Co. have their Frue concentrator in place, and expect to get to running this week. They have out quite a pile of ore. S. P. Wright's last run of ore yielded handsomely, and he has more of the same kind in sight. J. B. Strong is running a tunnel to strike one of his ledges. Abbott, Hubbard & Co. are sinking on one of their numerous ledges, and taking out good ore. E. L. Bilou's arista is running on J. Hallister's ore. J. Woodfield & Son are sinking on their ledge. Assessment work and prospecting is in progress on several claims.

BULLION.—*Shasta Democrat*, Jan. 8: Tom Green was in town Monday and shipped another good sized chunk of bullion. Another carload of heavy machinery for Iron Mountain arrived at Middle creek a few days ago. We are told that placer miners about Buckeye are doing well this season, most of them making from \$4 to \$15 a day. Hart, Day & Co., purchasers of the Fleming mine in Old Diggins distric, have all their machinery on the ground. Andy File is re-arranging the mill at Lower Springs and will soon have it running in tip top shape. He intends to mill custom rock. A new strike was made in Clark & Co.'s mine at Quartz Hill last Monday. Tom Harrison uncovered it while pipping some surface ground. It is a strong vein of quartz and carries gold. We are told that the Iron Mountain Mining Company figures on expending nearly \$900,000 on the Lost Confidence before a dollar is expected in return, and altogether the machinery will require 100 cars to transport it to Middle Creek. The Sunny Hill and Bullychoop districts are just now attracting renewed attention, and we are told that quite a number of prospectors are operating in the belt between those two points and four or five fine prospects were struck lately. Bullychoop especially will be a lively camp next summer.

Sierra.

LAST MONTH'S CLEANUP.—*Sierra Tribune*, Jan. 8: The Young America turned out nearly \$26,000 for the December run. The December cleanup of the Butte mine is reported to have been \$49,000. A cleanup was made at the Cleveland mill last week after a run of thirteen days. The result was \$4600. The mill has but eight stamps running, and the owners of the mine are jubilant over the result. Considerable gold was lost in consequence of a defective plate, hence short run. Hereafter regular monthly runs will be made, and as the ledge improves with each stroke of the pick, the output promises to be something handsome.

BULLION.—*Mr. Messenger*, Jan. 9: There was a treasure shipment one day this week of \$70,000. The cleanup at the Young America quartz mine, for December, was \$25,000. The Cleveland quartz mine, after a run of 13 days with eight stamps, cleaned up \$3800. This is the first run made at this mine. Gravel at the Ruby, from the bench on the left side of the channel toward Rock Creek, yields \$4 a ear load.

Trinity.

NEW RIVER.—*Humboldt Standard*, Jan. 9: Harry Smith, who returned last week from New River, says the Mountain Boomer, Hardtaek, Uncle Sam and Grover Cleveland mines are running, and that 60 or 70 men are now at the camp. He says there is no snow between here and there and none at New River City, but at the Mary Blaine mine there are from six to eight feet. He tells us that Mr. Williams has been constructing an arastra at Battle creek, which probably is nearly finished now. All the miners that have cleaned up report good turnouts, and confidence in New River, Mr. Smith tells us, is unimpaired. Wm. Levasseur, who returned from New River Friday evening, speaks encouragingly of times there. He says there are about sixty men in the camp; that there is no snow between here and there, and that the trail is good. At the Mary Blaine mine the snow is half way up to the roofs of the houses and from six to eight feet deep, but there is none at New River. The mines are all running, he tells us, and at their last cleanup the Mountain Boomer assayed from \$70 to \$75 per ton, the Hardtaek from \$50 to \$60 and the Toughnut the one in which Mr. Levasseur has an interest, from \$10 to \$50. He informs us that the new mines are being opened up all the time. Nothing is being done at the Mary Elaine mine, but he tells us there is a feeling among miners that there is money in the claim and that only capital and energy are necessary to make it pay. Mr. Levasseur thinks the prospects of New River are bright, and with an abundance of money to develop the mines, they will be made to pay. Four arastras are there now.

DEADWOOD.—*Cor. Trinity Journal*, Jan. 9: Will this new year that looks so brilliant for Deadwood prove as successful as the one just passed? I, for

one, see no reason why the new year, 1886, should not be the most prosperous she has ever seen. Look back as far as 1875-76, when gold in quartz was first discovered, when nothing could be seen but the tall cedar trees through which the wild beast roamed undisturbed. All the old mines have proven extensive and valuable, and with numerous other prospects and discoveries yet to undergo development by the hands of over 250 men finds Deadwood more brilliant than ever in the year of 1886. Bullychoop will be a lively camp this summer. Much prospecting will be done in the district, and the developed mines, which show up flatteringly, will, without doubt, yield handsomely. Freezing weather during the past week has materially shortened the supply of water for hydraulic mining purposes. More storm is hoped for when a thaw comes.

RICH ROCK.—We learn that the quartz recently crushed at the Brown Bear mill on Deadwood, for Van Matre Bros. paid an average of \$115 per ton.

NEVADA.

Washoe District.

CHOLLAR.—*Enterprise*, Jan. 9: Nothing being done in the mine itself, operations being concentrated in the sinking of the Combination shaft deeper for the 3200 level. This work is getting along well, having obtained a depth of nearly 70 feet below the 3100 station or level. Some delay has been experienced in cutting out a tank station and in repairing a leaky section of one of the pump columns, but this is all right now, and the work going ahead as usual.

HALE AND NORCROSS.—Owing to the concentration of work and hoisting facilities in sinking the Combination shaft deeper, very little exploration work is going on in this mine. A bulkhead is being put into the 2500 level to shut off a heavy flow of water which has been coming from that quarter. This, if effectual, will shut off thousands of gallons of water from the big hydraulic pump and help matters in that respect considerably.

OPHIR.—On the 400 level, west crosscut No. 3 from the main south drift continues progressing toward the west wall in vein porphyry with streaks of low-grade ore. On the 700 level the repairs to the station at the main shaft, being made jointly with the Mexican and Union Consolidated Companies, are concluded, and the drift to the northwest for exploration purposes getting along well in favorable working ground.

MEXICAN.—The face of the lateral drift north from the east crosscut on the 500 level is in fine looking vein material—soft porphyry, clay and quartz; total length, 302 feet. The joint drift started on the 700 level from the Ophir shaft for the use of this, the Union Consolidated Mining Companies, is now in about 60 feet. Formation favorable.

CON. CALIFORNIA AND VIRGINIA.—Nearly 2000 tons were extracted from this mine during last week, including the 1750 level and the Jones lease section. That from the 1750 assayed \$23, and from the Jones lease \$19 per ton. On the 1650 level the northwest drift was extended 29 feet, making a total length of 402 feet.

YELLOW JACKET.—The old upper levels continue their liberal yield of low grade ore—some of it too low grade for profit. The Brunswick mill is kept supplied and a considerable amount of dead work is being done in the old stopes and workings, exploring for better ore and more of it.

GOULD AND CURRY.—Work is suspended on the 1000 level and concentrated upon the re-opening of the 600 level. The station at the Bonner shaft on this level has been repaired, and the drift west and southwest has been cleaned out and retimbered for a distance of 110 feet; total, 230 feet.

UNION CONSOLIDATED.—On the 700 level a drift has been started, running from the Ophir shaft northwest, for the use and at the joint expense of this and the Mexican companies. The usual progress is made in the explorations on the 500 level, with no new features to relate.

BEST AND BELCHER.—All work is now confined to the 600 level conjointly with the Gould and Curry, the 1000 level being abandoned. The drift west and northwest from the 600 station of the Bonner shaft has been cleaned out and retimbered 167 feet; total, 250 feet.

COMET.—During the week some extra good ore has been taken from this old mine on the west side of American Ravine by parties residing in Silver City. The ore shows well in free gold.

SIERRA NEVADA.—The main north lateral drift on the 520 level has been extended 53 feet, making a total of 1463 feet in length. The front, or face, is in a vein porphyry formation, dry and hard.

CROWN POINT.—Daily yield, 400 tons from this mine and the Belcher. Ore extraction from the 1700 and 1750 levels has been suspended during the week in Crown Point, but is resumed again.

ALTA.—On the 700 level the lateral drift north toward the Benton ground is making steady progress, and showing good streaks and bunches of low grade ore.

KEYES.—The Keyes mine in Six-mile canyon will be re-opened for active ore extraction shortly, all litigation being nearly at an end.

KENTUCK.—The Douglass and Rock Point mills are kept running on ore from the old upper workings of this mine.

MONTE CRISTO.—The old mine continues yielding ore enough to keep the mill running.

BELLE ISLE.—East crosscut from the end of the north drift 450-foot level has been extended 14 feet.

Bernice District.

MEN.—*Silver State*, Jan. 9: There are thirty-three men employed at mining and milling in Bernice district. The mill, which has been shut down for some time, will start up next week.

Columbus District.

HOLMES.—*Candelaria True Fissure*, Jan. 9: The Cramer has improved very much during the past week. The ore in the eastern end of this slope has widened to 6 feet, and the ore is high grade. In the first intermediate shaft level drift, to cut the Creer, we are making fair progress. In the Cross development we have 4 feet of good ore. Sixty feet west of Cross development we have a good prospect, from which we are taking some good ore. The Creer looks well in the slope. It is fully 14 feet wide and the ore

is high grade. We melted 15 bars of bullion to-day that will be assayed and shipped to you to-morrow. The south crosscut from the west drift from this winze is in 27 feet. We have started a drift on the ore cut by this crosscut, and have 12 inches of \$50 ore. The east and west drift from winze below the east drift on the 4th level both show a little high grade. The east drift from the north crosscut on the fourth level is in 57 feet, and the face shows some low grade ore. A small amount of ore is being stowed from the intermediate drift connecting the No. 6 and No. 7 winzes. We have started stoping some low-grade ore from the intermediate between the first and second levels west of the shaft.

GENERAL GRANT.—The owners of this property are preparing the ground to set up a winze. It is the intention to follow the ledge down 200 feet before crosscutting.

CLIMAX.—Kent & Co. are pushing the face of the tunnel as fast as possible. They expect to cut the ledge shortly. The face is still in extremely hard rock.

Esmeralda District.

AURORA.—Cor. Bodie *Free Press*, Jan. 9: Yesterday an order was issued by the Con. Esmeralda Co., for a force of eight men to go to work on the New Esmeralda Con., in consequence of which provisions, mining tools, material and men were to-day en route for the diggings, when the order was countermanded. The cause of such an immediate change in the program with reference to that particular property is not known, but the supposition is that it is proposed to defer developments thereon until the issue of patents is made certain. If the current report on our streets is true, that mechanics, carpenters and laborers have been engaged to execute the plans prepared for the hoisting works on the Humboldt Con., and that the necessary material has already been ordered, it shall not be long before the steam whistles shall make answer to those whose greetings are daily wafted in from the neighboring town of Bodie. During the past week strange and familiar faces of both laboring and business classes of people have appeared among us, the object of each evidently being to better its condition. Up to the present time not a pick has been struck for the London company. However flattering the prospects of Aurora may appear, perhaps it may be well for those living at a great distance whose finances are limited and who intend seeking employment here, to consider this cold fact, and await more substantial evidences of prosperity.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, Jan. 9: During the 10 days ending yesterday, ore shipments were made from the mines of the district to the two reduction works in town as follows. To the Richmond works—California mine, 27 tons; Continental, 1½; Hamburg, 6; Silver Lick, 49; Bowman, 5; Paul Fry, 9; Silver Connor, 80; Oriental and Belmont, 4; Prospect Mountain tunnel, 5; May, 15, and Independence, 10. To the Eureka Con. works—Hamburg mine, 31 tons; Alexandria, 5½; Dunderberg, 32½, and Bowman, 4.

Lewis District.

GOLD.—Battle Mountain *News*, Jan. 9: T. G. Morgan shipped last week one bar of gold bullion valued at \$2100, the result of one week's run at the Pittsburg gold mill. J. A. Blossom has purchased of Mr. Morgan a seven-twelfth interest in the mine and the entire interest in the Pittsburg gold mill, store, assay office and boarding house. The dispute between the Pittsburg and Dahlgren Mining Companies over their boundaries has been amicably settled, much to the disgust of the lawyers, who anticipated litigation.

Temple District.

STERLING.—*Pioche Record*, Jan. 6: A couple of weeks ago Hill Gear went over to Temple district to get samples from the ore-body in the Sterling (old Inca) mine, and the samples were assayed and shows as follows in silver: No. 1, \$37.70; sample consid; ered no good, \$631.49; picked sample, \$565.51; waste dump, \$40.83. The sample considered of no value, it is seen, nearly \$100 higher in silver than the picked sample. Two samples from the Standard mine, an adjoining claim, went \$120.93 and \$31.42 in silver.

ARIZONA.

CAVE.—*Clifton Clarion*, Jan. 7: Mr. Isaac Hann, in his claim four miles north of the Metcalf mine, came across a cave about 50 feet long, 20 feet high and 15 feet wide. Stalactites bearing rich copper hang from the roof and equally valuable stalagmites rise from the floor, presenting a sight at once novel and interesting. The interior has not been fully explored, but the probabilities are that Mr. Hann has a very rich find in store for him.

GOLD ROCK.—*Prescott Courier*, Jan. 8: The talk is that about 35 tons of gold rock from the Bullwhacker mine milled about \$75 a ton. Anyway, Messrs. Lester Jackson and John Curtin, who had the ore worked at the Sterling company's mill wear golden countenances. On Groom creek, Messrs. Cartmell and Hughes have just made a successful run on silver ore belonging to Messrs. Bones & Spencer and Charley Wallace. Their works consist of five stamps, two pans, concentrators and vats. W. C. Dawes, having finished working Peck tailings, is now pumping water out of the mine, and will shortly start a tunnel to strike the ore far below the surface. We believe he has done well working tailings. The Sterling mine is doing well by its owners, who are well satisfied of their ability to work it at a profit. Gen. Withers thinks of putting up a good sized mill in Cherry Creek district, to work gold rock. The Del Pasco mill is running; water is, however, scarce. Its owners have plenty of rich gold rock at their command.

THE LOST BASIN MILL STARTS UP.—*Mohave Miner*, Jan. 9: Stevens, Osgood & Co. have completed their new gold mill in the Lost Basin district, and had everything in readiness to start up last Monday morning. Beecher & Co.'s big team has arrived and is now hauling ore from the Ida mine to the mill, a distance of about five miles. On this mine Stevens & Co. now have fourteen men employed, which with those at work in and around the mill makes a total of about thirty on their payroll. There are now about fifty men at work in this district, which promises soon to become one of the most important in the county.

SOLD.—*Silver Bell*, Jan. 9: We are reliably informed that the Woodpecker mine, in Mineral Hill

district has been sold and part of the purchase money has been paid. The sale is an important one in the mine bids fair to become the mine of Arizona. It shows valuable ore throughout the entire claim.

COLORADO.

PAY ROCK MINE.—*Colorado Miner*, Jan. 9: 60 men are working on the Pay Rock mine. Each of the three main levels are being pushed ahead. The lowest level, viz. that from the ninety foot shaft, is producing more money in one month than it has in the last seven years. The last mill-run from this level gave returns of 1154 ounces in silver per ton. The ore in this level was always of very low grade, but has changed to that of the very highest grade, proving that depth is what the Pay Rock wants for larger and more permanent ore bodies than have existed in the upper levels.

DEMOCRAT MOUNTAIN.—*Pat's McNulty* is pushing work on the Bonanza tunnel, and is now on crevice matter, no count. The Fred Rogers vein, McVeaty & Welch are still pushing ahead on the east ridge, on a solid vein from four to twelve inches wide. The Lucky Hesperus is still furnishing its usual quantity of ore. McFadden & Co. have fine prospects on the West Rogers. The Dolly Varden and Whittier mines, Griffith mountain, will be developed to paying properties if energy and money will accomplish it. Reports from the Astor are to the effect that all the different workings of the mine present a good showing. Several new leases have been recently taken. We are informed that work will be resumed upon the Flagstaff group of mines in the spring. A tunnel was run to within about 100 feet of the Flagstaff when work ceased last fall.

IDAHO.

SMELTER NOTES.—*Ketchum Keystone*, Jan. 9: The North Star mine is daily shipping ore. The West Fork mine gives every promise of renewing its old reputation of taking out rich ore. Vice-President and Treasurer Wright of the Pacific M. & S. Co. arrived from Philadelphia. He finds the outlook more favorable than since the organization of the company. The Irvin mine, leased to Mike Carey, is in nearly three feet of ore, and shipping daily to the smelters.

FROM ATLANTA.—E. H. Pierson came over from Atlanta, arriving in Ketchum on Monday evening. He was on the road two days, coming over on snowshoes. About a dozen men were at work in the different mines about Atlanta when our informant left, but it was expected to put on about 12 more men in the Last Chance yesterday, which makes the total number of men at work at Atlanta about twenty-five.

THE FISHER MINE.—P. J. McDougal, who has been at the Fisher mine as foreman, came in on snowshoes Sunday. He says no work is now being done at the mill on account of the water supply giving out. He informs us that Superintendent Eugene Antz has solved the problem of saving the gold, and has made good returns from all ore crushed while the water supply lasted.

MONTANA.

ORE.—*Butte Inter-Mountain*, Jan. 7: For years the dump of the Anaconda mine has been accumulating till acres of the side hill below the mine are covered and piled up with thousands of tons of ore awaiting shipment to the smelter at Anaconda. As the railroad by which the ore is taken away runs above this vast accumulation it was no small problem as to the best method by which this pile could most economically be raised from the dump into the cars for transportation. But the ingenuity of Mr. Daly, the manager, was fully equal to the emergency. Knowing the expense of erecting and conducting a hoist on the side hill he determined to let the ore back into the mine and rehoist it in the same manner as that recently mined, and carry it to the ore house, when it can be shipped without inconvenience. To do this a level was run from the main shaft directly beneath the old ore dump and an ore chute established down to the level in such a manner that the ore can be loaded into cars and raised to the surface with the greatest ease. A new crosscut has recently been made at the 800-foot level opening up a 95-foot vein of rich copper ore, some of which is over 70 per cent copper. At Clark's Colusa the shaft is being timbered for a distance of 200 feet, (from the top to the 300 foot level) as the pressure on its old timbers was more than they could support. The formation is soft and the surface appears to be settling around the hoisting works, extending up to the Lickwater, just to the north. The new timbers now going in have the appearance of being able to stand no end of pressure and will without doubt remain in position safely for years. At the Lickwater a small force of men was put on at the beginning of the year, and as soon as the old ore dump is used up, which the Lickwater smelter is daily diminishing, a full force will be put on and the work pushed vigorously. At the Parrot the shaft has recently been sunk another hundred feet, making its depth now 400 feet, at the bottom of which a station has been established. The shaft here is about 20 feet from the main vein, and it is estimated that when a depth of 500 feet is reached, or 100 feet farther, it will encounter the hanging wall, which will facilitate somewhat the removal of the ore. The Lexington mill started up in full blast again to-day. Thirty of its 60 stamps have been idle for the past three weeks while repairs were being made.

PHILLIPSBURG.—*Cor. New Northwest*, Jan. 9: The Hope Mining Company have struck ore in the new shaft. It is of excellent quality and abundant in quantity. I will write full particulars about the lode in my next. Supt. Babcock will start the mill up on the 15th for a long and assured successful run. The Granite mine still continues to improve with development. The mill is running steadily on second-class ore. The bullion shipment for December, 1885, was over 100,000 ounces. The Buckeye Belle syndicate have suspended operations on the Fraction and Belle lodes. James Patten, of the Poor Man mine, says the vein never looked better—has a thousand tons of 40 oz. rock in sight. The crosscut to the level south in the Frisbee shaft has been completed. I hear that Eli Harland, Patten and Hynes have struck it rich in the 'Frisco,

NEW MEXICO.

BALD MT.—*Silver City Enterprise*, Jan. 8: Messrs. Porter and Smith have commenced work upon their claims at Bald mountain, and are taking out a grade of ore that pays them handsomely. Bell & Stevens are preparing to start up the Place and Johnson mill at Pinos Altos. They have about 350 tons of low-grade ore already out, which they will run through. J. W. Fleming has gone to Dos Cabezas to look after his Galena Chief mine, which is reported as looking well and producing enough high-grade ore to keep the mill steadily running. The old gold district of Pinos Altos bids fair to yet become one of the best producers in Grant county. It has been discovered that the iron pyrites are richer in gold than the free-milling ores. Los Cerillos remains the sluggish camp, albeit no district ever had more advertising. Unless the miners up there show some results before long, the people's opinion of that camp will be about the same as that held by the ancient Jews concerning a little suburb called Nazareth. The Conductor claim at Gold Hill, owned by Messrs. Norton and Cullom, is reported as being an unusually fine prospect. Recent work upon it shows a well-defined lead of high-grade ore, which will pay to ship. Owing to the Indian troubles it has been almost impossible to do any work upon the claims in this camp. We learn from O. J. Case, who has just completed the assessment work on a number of claims at Gold Hill, that the properties in that camp are looking better than ever. An average sample taken from the Mammoth and Big Boy claims owned by Mr. Case run \$157 in gold, and the lead is an immense one. Many tons of ore could daily be furnished a custom mill from this mine.

WATER CANYON.—*Sorocco Bulletin*, Jan. 9: C. B. Ott is running the concentrator with marked success. Wm. Smythe has located a fine chicken ranch in Copper canyon. Martin Joyce, A. Radcliff, Mike Wallace and A. Robinson paid Sorocco a visit this week to celebrate. Chas. B. Ott is now cross-cutting to the west in the Jane Bowman, at a depth of 60 feet, and is raising fine pay gold mineral. Maher and Nelson have a splendid showing in their Wide Awake mine, and are now making a road to ship ore to the Haase, Ott & Co. concentrator. The Graphic company have taken off their men from the Georgia Bell and the Iron Lead, but will resume work when the company has reorganized. Martin Joyce will next week commence work on the Steward and Joe Marks. This claim lies parallel with the Jane Bowman. Arthur Radcliff, one of the owners of the Little Nellie in North Fork, and the Jane Bowman, keep the Haase, Ott & Co. concentrator busy, running to its full capacity. The concentrates are shipped to this city for treatment. On the first of the year M. McLeish relocated for himself and Judge W. G. Lane of New Orleans, the famous Magnetic Iron lode, situated in Water canyon district. The ore from this claim is well known all over New Mexico, and specimens from it are sought for by those having mineral cabinets, owing to its magnetic polarity. In addition to the excellent iron which it affords, this mineral yields both gold and silver.

OREGON.

QUARTZ AND PLACER.—*Jacksonville Times*, Jan. 8: Less frosty weather and more rain is earnestly hoped for by placer miners. Prospecting continues unabated and several promising discoveries are reported. There is still considerable excitement on Wagner creek, where much prospecting is being done. Walsh & Bragdon have had 26 tons of tailings from their ledges on Wagner creek shipped to Medford for reduction. Oliver Boyd was over from Blackwell, and reports that district full of prospectors, some of whom report promising discoveries. Considerable snow lies on the higher hills surrounding the county, which will be quite acceptable to the miners later in the season. Most of the miners now use reservoirs, and with good effect. Much mining is done in this manner, that would otherwise be impossible. It is said that the machinery necessary to make the Medford quartz mill a ten-stamp one has been shipped from San Francisco, and will soon arrive. W. A. Cook was up from Foot's creek this week, from whom we learned that more mining is going on in that district than for several years past, and with good prospects. A partial cleanup was made at William Bybee's diggings, near Waldo, formerly in dispute with Wm. Newman, and about \$500 realized. Good reports are expected from these mines this season. A portion of the quartz mill for this place was hauled to town since our last report and the balance is expected here at once. The machinery will be put in position as soon as possible, and it will not be many weeks before quartz will be crushed. Our town is to be congratulated thereon. The company spoken of in the last issue of the *Times* as intending to prospect the old Bowden ledge on Jackson creek has been organized, and will commence operations at once. The company will be fully organized soon, and proposes to thoroughly prospect the above ledge, which was a paying one in early days.

PINE CREEK.—From a private letter from S. K. Senor to an acquaintance in Tuscarora, Nev., over date of Cornucopia, Oregon, December 22d, the *Times-Review* makes the following extracts regarding that section: Times are very hard here, no money in the camp, and but very little work being done. We have had no cold weather as yet, and although the snow is about two feet deep in town, six miles from us, down the creek, the ground is bare. There are not more than 150 men in the camp up to this time, but there will probably be an increase in the spring. There are 48 cabins and houses in the place with roofs on them, and 43 in Allen town, with some four or five between the two places. The Louisville company have located and surveyed a mill site in this place, at the junction of Elk and Pine creeks, and have erected an office upon the ground and have just completed a boarding and lodging house at the mine, and have commenced sinking on the Whiteman location.

UTAH.

SANDSTONE.—*Southern Utah Tribune*, Jan. 6: The outlook for the camp on the 1st of January appears more promising than at any time since horn silver was discovered on Tecumseh Hill. This flattering prospect has been brought about not alone by what the deep workings have been showing up, but

by dozens of the surface properties which were looked upon as mere prospects a few months ago and which are now looming up paying mines. The manner in which the California, Maggie, Buckeye, Savage and Last Chance have been panning out and the fine ore bodies encountered in the lower workings gives us every reason to expect that our mines are permanent, and that the sandstone ledges carry ore to a far greater depth than was asserted by a number of book-learned geologists and expert mineralogists who visited the silver-bearing reefs when the white metal was first discovered here. The ledges which they claimed carried ore simply near their outcrops are now being successfully worked on the four, five and six hundred levels, while in the Savage and Buckeye the main working shaft is at present down nearly 700 feet and the seventh level will soon be started on the ledge. The immense body of rich ore discovered and opened up in the Stormy King since last summer, and which lies but a few hundred feet south of the town of Silver Reef, is another most favorable sign of our coming events. The big showing that has been made within a few weeks past in the Butte, and in the Vanderbilt, Bavaria, Lamb & Steele, Crompton, Bonanza and other mines on the East Reefs, and the stacks of pay-rock piled on the dumps and appearing in the slopes of the Leeds, Honest Miner, Bonanza, Silver Gate, Little Chief and other mines on the White Reef is a most healthy indication of our future prosperity. The old theory that the ore in the sandstone ledges would change to sulphurets and be too base to pay as soon as water would be encountered, has been entirely exploded. The ore, 400 and 500 feet below where water has been found, continues to retain a chloride form and is as free as it was on the surface. The new leaching works which has just been completed here at a cost of several thousand dollars, is one of the most complete mining plants of the kind on the coast. If the managers are able to treat lowgrade ores as successfully as they have promised, the works will pay big and give a strong impetus to our mining interests. Capitalists, desiring mining investments, have been taking considerable interest in these matters of late, and unless silver drops way down below bed rock prices, we may expect a boom here before spring. The Stormont mill lost three days last week, by a freshet on the Virgin river breaking the dam, while the roads were rendered very bad by late storms, in consequence of which but an average of twenty-six tons of ore per day was crushed during the week. The ore, in the slopes of the Buckeye & Savage, has not been of as high a grade or as strong in the slopes as it was last month. The main working shaft is being sunk below the 600-foot level, and the ledge is showing some good indications of ore. The Christy mill, during the past week, averaged forty tons of ore per day. The mines are looking well and the ore produced is first-class.

REVIEW.—*Salt Lake Tribune*, Jan. 8: The first week of the new year has given us some snow, and the first real winter weather of the season. But in the valleys the cold has been by no means severe, though some deep downward excursions of the thermometer are reported from the hills, one of upwards of thirty degrees below zero. The receipts of the metals in this city for the week ending January 6th, inclusive, were: Of bullion, \$39,522.11, being the smallest for a long time, but as the banks adopted the Saturday holiday, there were really but three business days in the week; of ore, \$10,900; total, \$50,422.11. The Ontario makes no report this week, the mill, we understand, being stopped for some needed repairs and renovation after a long run. The Horn Silver product for 1885 is given by Mr. Doody (for three months) at 4,905,932 lbs. of refined lead and 123,062 ounces of silver. There is nothing new to report locally, except that the development work is going forward steadily, and there are hints from time to time of the nearness of the new workings to the expected ore bodies. The product of the Hanauer smelter for the week was four cars of bullion, \$12,550; of the Germania, six cars, \$17,499.11. Ores received were McKay & Revolution, \$2400; miscellaneous, \$16,300; Queen of the Hills, Idaho, \$1200.

THE NEW MARSAC.—*Park Record*, Jan. 9: It was reported some time ago that the Marsac mill would start up about the 20th of January, but they will not be able to commence till about the first of next month. The 20 old stamps have been fitted up and to more added, so that the Ontario has only 10 more than it. One hundred and twenty men are now at work, and shoving things along to a rapid completion. The cooling floor is finished, and everything about the room has a uniform appearance, and is not chopped and broken up like some. There will be no salt stamps, but the Cornish rollers will be used in their stead. Many improvements have been made, on the manner in which the work is done at the Ontario mill, and the new one will be better and handier. It will take about 70 men to operate it, and when finished will be one of the best and most complete mills ever built in the Territory.

WASHINGTON TERRITORY.

STRIKE.—*Colfax Gazette*, Jan. 9: A private letter received in this city brings intelligence of another richonike in the old Dominion mine, in the Colville reg. The new find is seventy-five feet north of the upper shaft and proves to be a continuation of the main ledge, materially enhancing the value of the property. The last discovery is what is known as grey horn silver, and is very rich.

SILVER.—*Spokane Falls Chronicle*, Jan. 9: From six assays taken from the west vein on the 'Young America,' the average was \$81. The main vein shows eight feet of solid metal, which assays from \$50 to \$119 silver to the ton. The silver is quite evenly distributed through the mineral and it requires very little sorting. Richard Chilsom estimates the dump to contain 1000 tons of good ore. A fine body has been found on the face of the cliff 600 feet to the south. There are eight men at work for the company now and more will be added shortly.

GOLD.—*Skagit News*, Jan. 9: James McCauly, another of the Ruby creek miners, is spending a few days in town. Mr. McCauly exhibits some very fine nuggets of gold weighing from \$3 to \$6. He confirms the report of Giddings as published last week, McCauly and his two partners have taken out 140 ounces of gold this season, rating over \$17 an ounce, and amounting to over \$2380 for the season's work. McCauly has been in the mines since 1879, and had not seen a white woman for three years. Last winter he spent in the mines alone, and for months saw no human being.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize its poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.**No. 2 is superior to any powder of that grade.**

PATENTED IN THE UNITED STATES PATENT OFFICE.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

Newspaper Agents Wanted.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference.—DEWEY & Co., Publishers, No. 252 Market St., S. F.

Lost Papers.

If any subscriber fails to receive this paper promptly after making due inquiries at the Postoffice, he is urgently requested to notify this office by letter, that we may send the missing papers, and, if possible, ward against further irregularities.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examination ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent. Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes necessary, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

ASSESSMENT NOTICE.

Pine Tree Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Summit Mining District, Kern County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 22d day of December, 1885, an Assessment (No. 1) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 4 (second floor), 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 27th day of January, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 16th day of February, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUNNINGTON, Secy.

GOLD MINES

AND

Mining in California.

The new book with above title is one in which all gold miners will be interested. It describes the Quartz, Hydraulic, Drift and Placer Mining Methods, and progress and improvements made in the Business or Gold Mining.

California is a grand field for the profitable investment of capital. THE AUERERUS REEONS are described, each County being separately treated, and the mines producing bullion or in course of development are referred to. The appliances in use are described. Those who wish to know how and where gold mining is carried on in California, want this book.

Price, \$1.50, sent by mail, postage paid, on receipt of price.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street,

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\\$550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

**THE
"TRIUMPH" ORE CONCENTRATOR.**

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$199.15, or \$8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed hood is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company. In a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, flamed by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchases against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St.,

RANKIN, BRAYTON & CO.,
BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 1/2 St Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH of the YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE THAN ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000 pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

SEND FOR CIRCULAR.

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.
BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.
E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

MINING REVIEW EDITION--TWENTY-FOUR PAGES.

BY DEWEY & CO.,
Publishers.

SAN FRANCISCO, SATURDAY, JANUARY 23, 1886.

VOLUME LII
Number 4.

Prehistoric Printing.

There are several places in the State of Nevada where there are "pictured rocks," the work of the aborigines. One of these places is near Buckland's ranch, on the Carson river. There are also several such rocks a mile north-east of Verdi. We give an engraving of one of the group of rocks found eight miles from Buckland's ranch. The drawing was made by Miss Mary Marsh, and the engraving was made from her drawing for the *Reno Gazette*. It is a basaltic rock about four feet high and four feet wide. The largest one is within a couple rods of the river. It is eight feet long, five and a half across, and fully five feet thick. It is of a dark reddish or dirty brown color and very heavy. It is of lava formation, probably, and has been worn smooth by water. All around lie similar rocks, together with large and small boulders of pure granite. The rock spoken of has a oblong hole about two inches by four, and sixteen inches deep at the left end, which has been chipped out before the lines were drawn, as it seems to be the starting point for the whole scheme of the artist. The rock lies with a broad, smooth top face, at an angle towards the south, and its top and the sides are covered with lines and marks that convey to the present generation no intelligence whatever. A line half an inch wide starts at the hole on the left, and hending downward, forms a sort of border for the letter until it reaches midway of the rock, when it suddenly turns up and mingles with the hieroglyphics above. Two or three similar marks cross on the top of the stone, and one runs across the north side losing itself inside a coating of hard, dry moss that seems as old as the stone itself. From the line at the bottom hangs a few scallopy looking marks that may be part of the picture, or may be a fringe or orna mental.

The figures are not those of any animal, bird or reptile, but seem to be made up of all known forms and are connected by wavy snake-like lines. Something that might be taken for a dog with a round and characterless head at each end looking towards you occupies a prominent place near the lower line. The features are all plain enough. A deer's head is joined to a mixed up patchwork that has something that may be meant for four legs beneath it. Bird claws show up in two or three places but no bird is near them. Snaky figures run promiscuously through the whole thing. A circle at the right end has spokes joining at the center and running out and losing themselves in the maze outside.

Similar marks cover a whole side of the creek's bank, where the north fork of the American has washed a smooth ledge bare for many feet in height and length, at Soda Springs, 11 miles from the Summit, C. P. R. R. Near the big Verdi rock are two less than half the size, which have been used as canvas by the ancient artists. The larger of these two has less than half as much as the one described, and the least has less than half what the other has. In fact one scroll, a foot across, is all it bears. A small hole in the upper right hand corner furnishes its start also, and all its lines are run at tangents and angles, making a double-ended kind of an arrangement of many-headed arrows, pointing three ways. A snake like scroll lies

between the two arms, but does not touch them. Below are blotches, as if the artist tried his tools. This region has been roamed over by the Washoes from a remote period, but none of them know anything of the works. One who

It is estimated that since the gold mines of Gilpin county, Colorado were discovered in 1859, they have produced \$60,000,000. During the year 1885 the stamp mills treated 158,528 tons of ore of the value of \$1,017,281, and the

FURNACE FOR ROASTING ORES.

has gray hair and as many wrinkles as hairs, who is bent with age, toothless and almost blind, and who is said to be 100 years old, was led to the spot, and said he saw them a heap

mills saved 17,339 tons of tailings or concentrates of ore crushed of the value of \$355,752. There were sold 16,673 tons of smelting ore for \$1,251,817. The placer claims produced \$14,

INDIAN RECORDS ON THE ROCKS IN NEVADA.

long time ago, when he was only a few summers old and they looked just as they do now.

THE Bonanza King Company's mine, in San Bernardino county, is looking fine. The old mill site is being cleared off for a new mill. The miners say that the miners are all looking as well now as any time during the past two years.

318, making the total product of Gilpin county for 1885, \$2,639,168.

THE possibilities of quartz mining that can be realized in California may be understood by the statement that ore being taken out now from the Sierra Buttes that yields only \$5.50 per ton pays a good profit, as the mining and milling of the same costs but \$3.09 per ton.

Ore Roasting Kilns.

For roasting ore in kilns various types of furnaces are given in the works on metallurgy, their general character being of masonry with both bosh and shaft. The kiln which seems to meet with most general favor for roasting iron ores is known as the Gjers calcining furnace, in the Cleveland district, England. These have a bosh and shell of sheet iron supported from a mantel resting on columns or brackets and are lined with brick. A cone of masonry covered with iron plates is placed at the bottom, and the furnaces are often provided with iron hoods or chimneys. One of the American modifications of this furnace was described by John Birkinhine, of Philadelphia, before the American Institute of Mining Engineers, and is shown in elevation and section in the accompanying engraving, supported on columns, and arranged to be filled directly from railway cars, which pass over the top. These roasters have perforations in the shell and lining which serve as poke-holes. At the Colebridge furnaces, Lebanon, Pa., there are 16 roasters arranged in this manner. These kilns are 17 feet diameter at bosh, and 15 feet, 17 feet, and 18½ feet high.

The ore roaster is covered with a hood of wrought iron, and also has a wrought iron draught stack controlled by a damper. The base is of solid masonry, circular or octagonal, covered with cast iron plates. Cast iron plates surround the base of the kiln to facilitate shoveling the ore. The hoiler iron for shell cone and draught stack for ore roaster weighs about 16,000 pounds. Some of these roasters are made without any hood or cover above the charging level. In many cases the poke-holes are simply circular openings cut in the shell and extended through the lining.

Our Mining Review.

We devote a large part of the space of the double edition of the MINING AND SCIENTIFIC PRESS this week to our annual review of the mining industry for the past year. It was necessary to defer this until the latter part of January, in order to get the statistics of different sections, without which such a review as we care to give would be incomplete. The reader of the PRESS this week will have before him a condensed account of the doings in all of the prominent districts and camps of the coast, with the result of their past year's work, and the prospects for this year. In order to give suitable space to this review, we have given only one page, instead of two, of our usual summary of current mining news.

The PRESS is in a position to keep track of the events connected with the mining industry, and this review should be read by all interested in mining development. It shows what all the mining communities are doing, and how one compares with another. Our own State of California still maintains the position it has held for some years, but other regions are gaining rapidly in product and our capitalists should observe what the efforts of others have done in making fortunes in other places. The PRESS of this week is worthy of preservation for reference, containing as it does so many facts and figures, and so much general information concerning the precious metal mines of the United States.

Formation of Mineral and Metalliferous Veins.

The New Hypothesis vs. the Old.

EDITORS PRESS:—Seeing that Mr. Blackburn, of Idaho, has written you an article on this subject—published in the PRESS of Dec. 5th, 1885—though he does not refer directly to our article in the issue of Sept. 19th, 1885, yet we apprehend his aim was to confute the new hypothesis by a rehearsal of the old. It is human nature to meet each new discovery with opposing forces, nevertheless truth will prevail.

With regard to the new hypothesis, while we do not claim it as a scientific fact, yet we esteem it worthy of careful consideration, and so plainly demonstrated by the plate, on a small scale, as to set aside any doubts regarding its possibility.

So far as I am aware, all writers on this subject allow that the metals existed in the globe from its inception; then, they presume they were formed into veins afterward. Certainly if the law of affinity holds good on a large scale as it does on a small one, as is so beautifully shown on the plate, it would be contrary to the laws of nature for metals to take any other than their present form in the beginning; and no subsequent eruption of the earth's crust would be necessary to receive them from the percolating waters.

If the old hypothesis were true we would expect to find vein matter alike from each wall towards the center, or else a stratified deposit from the bottom upward. We would also expect to find that the mineral waters had overflowed the crevice, especially in uneven ground, and formed an incrustation of ore on the bed-rock, and even on pebbles or boulders near the vein. Such deposits have never come under our observation. We would likewise expect to find the walls matched, as a protuberance on one wall where a cavity existed on the opposite one, yet in our experience the contrary is the rule; a bunch of ore or even a chute of considerable length forms a cavity in each wall.

We do not understand why any author should attempt to cite the geysers of the Yellowstone National Park, or other existing hot springs, in favor of the old hypothesis; since they serve more definitely to prove the contrary. Who has ever learned of a hot spring filling a crevice or crater with precious metals? If such were the case, miners would have sluice boxes or arastras on every hot spring in the mountains.

The fact that metals exist mostly in mountainous regions is undoubtedly due to the natural tendencies of electric currents to follow the course of metalliferous districts passing from belt to belt, as from one cloud to another, and producing those wonderful mountain upheavals in their path.

One of the greatest obstacles in the way of the new hypothesis, and one which for a time seemed insurmountable, namely,

Contact Veins.

Can probably be accounted for in a very reasonable way. In Vipond's Mining District, ten miles from Glendale, M. T., is a perfect "blanket ledge," the Lilly, situated on the west side of Sheep Mountain. The ledge is from six to eighteen inches in thickness, carries good shipping ore, is on a lime foot-wall, but has no other covering than from two to four feet of slide rock that has broken off and slid down from the top of the mountain. Now the question is, where is the hanging-wall of this vein? We would venture to presume that during an eruption of the ground by earthquake the hanging wall either sunk or else separated so far from the vein as to form the high, steep mountain on the opposite side of Blue-bell gulch. But, to say the least, some terrible eruption has denuded the vein of its west wall. Now suppose such an action had taken place in some of the older formations, say in granite, then at a later period a lime formation was deposited on top and takes the place of the missing wall, here then would be a perfect contact vein.

The value of a true theory on this subject is certainly momentous, as the amount of capital and labor annually expended without realizing any returns might be counted by millions; and if metalliferous veins are merely "filled waterways," the filling of fissures that occurred promiscuously, then we may look for no natural guide to the deposits of wealth in the earth's crust, and must trust to blind Fortune to lead us to the coveted treasure.

But on the other hand, if "Nature does nothing in vain," she must have left us an index to her stores, which, by learning to read her language correctly, the student of her laws may seek and find mineral deposits just as accurately as the astronomer discovers a new planet by its influence on those under his observation. And though it may require years of study and close observation to reduce this new hypothesis to a science, yet we believe the task will be no more difficult and much more beneficial than that of botany, astronomy, or other natural sciences.

It seems to us unreasonable to conceive of boiling water rushing up from the bowels of the earth charged with heavy metals in solution, and depositing the richest stores, in many cases, near the surface, while the lighter matter, har-

ren of the precious metals should remain at the bottom. Again, in cases where a vein changes, gradually blending with the "country rock," until at a depth of but six or eight feet below the surface, it is completely lost. From whence came the "hot waters and pressure," to deposit this mere foundation of a vein on the surface?

If fissures in the rocks were filled by metalliferous matter from percolating waters, or to use an original phrase, if the metals were sweated out of the country rocks, why did not this sweating process take place on the surface? For instance, on hillsides just as well as on crevices immediately at the surface? If such were the case we would find mountain sides in every mining locality beset with quartz and ore.

Now, one word more with reference to our "tin-type" plate (sent the editor with our first letter, and referred to at the time), and we are done. As the affinity of metals is shown to draw them into veins, under favorable conditions, so we think a continuation of those conditions would draw it into bunches. The spurs we believe to be "feeders" to the main vein, consequently a large bunch or "pocket" is formed where a spur comes in, and as the force or affinity is thus increased in proportion to its size, therefore a subsequent effect of a large bunch would be to absorb all adjoining minor deposits from its main vein, thus leaving a barren gangue to fill the crevice between the pockets or chutes; hence, "spotted mines."

Now, Mr. Editor, we draw our communication to a close, leaving our new hypothesis to the careful consideration of your conscientious readers, cautioning them to ever hear in mind the profound words of the philosopher: "Great men's names are too frequently used as a stronghold for error." HENRY W. BROWN.
Glendale, Montana.

Montana Mines.

The Anaconda Mine and Smelters.

[By Our Traveling Correspondent, R. G. HUSTON.]

Anaconda is located 22 miles southwest of Butte, and contains, at the present writing, a population (estimated) of nearly 4500. The smoke arising from the smelters enables a person to locate the town from a long distance. It is the terminus of a branch of the Utah Northern, and there is no doubt that it contributes largely to the prosperity of that road. The growth of the town is certainly phenomenal, as it is only two years old. The future outlook for the town is surely a bright one, for the smelting works that brought the town into existence and gave it the name it bears, are of the most extensive in the world, and while the company have one of the largest and best developed mines in Butte, they also propose to treat custom ore that may be brought to them. Having ample means and facilities for this, it will give miners who have properties in the vicinity a chance to develop their mines and get their cash as they progress.

The Anaconda Mine

Is located on the top of the mountain east of Butte, half a mile from the center of the town, and was purchased four years ago by Messrs. Haggin & Tevis, of San Francisco. Since that time they have invested over \$2,000,000 in improvements on the mines and works to reduce the ores, and it is now one of the most valuable copper mines in the world.

The shaft is now 1000 feet deep and is divided into three compartments, two for hoisting cages and one for the pump and air pipes. Crosscuts have been made in the vein from east to west at every 100 feet below the surface and stations put in, and every contingency has been provided for systematically working the mine, both for speed and safety, as the ore body is of great width and uniform richness, especially in the lower levels.

Down to the 200 foot level the percentage of silver was very small but below that point it increases and is now found to the amount of from 10 to 30 ounces per ton. It is this fact that enables the Anaconda Company to sell their copper at the same rate as Eastern copper, which is produced at so much less expense. The St. Lawrence shaft penetrates the vein at another point and has also a complete steam hoist and it is connected underground with the main shaft. The large air compressor at the main shaft supplies both mines with compressed air for drills and fresh air for the miners. Each of these shafts have large ore chutes and the Utah Northern Railroad have a switch laid and run their cars under these chutes, and although each car has a capacity of 20 tons, it does not take three men over one minute to load a car. These cars are also provided with a patent dumping apparatus and one man can dump it easily in one minute's time, the cars being run up to a grade, to a height of 75 feet above the main track and then weighed and dumped.

The Reduction Works.

The rock breakers are fed automatically from these chutes and dropped in bins. From thence it is drawn into small cars and again weighed and dumped into a chute which carries it to the rolls. These reduce it to a fine sand and it is sieved and the course is returned to the rolls for further reduction. It is then passed in the jigs some 300 in number. The water in these being kept constantly agitated, the valuable portion of the product sinks to the bottom and the top is carried off as waste.

The ore passes from the bottom of the jigs to receiving troughs and from these is shoveled into cars and conveyed to the draining floor and thence to the reverberatory calcining furnaces where it is desulphurized and dropped to be taken by the matting furnaces where it is separated from the slag by skimming. It is then drawn from the furnaces and run into bars and then taken to the matte house and run through a rock breaker and crushed in small pieces and sacked in sacks of 100 lbs. each and shipped to Swansea for further reduction. It seems as if so large a firm as this one, could put in machinery and make a clean separation of the different precious metals at a profit to themselves. The immense production that they handle would certainly be a very large object in building works of that kind but as I am well satisfied that they understand copper mining and reduction of copper ores better than I do, I will withdraw my suggestion. Their electric light and a portion of their machinery is run by water power derived from a ditch from Warm Spring creek which is brought around and runs two turbine wheels 30 inches in diameter. The fact that they have 70 feet fall will give some idea of the power they get from these two wheels, that, in connection with an immense engine, run all the machinery in these works. The present capacity of

The Concentrating Works

Is six hundred tons daily, but when the new building three-quarters of a mile below, so as to admit of taking up their water-power and using it a second time, is completed and equipped with the requisite machinery, their capacity will be doubled twelve hundred tons per day: a small mountain in itself. When one thinks of this amount being handled every twenty-four hours and the full seven days for a week, and continued right along, it runs into immensity. Some figures showing the size of

Some of These Buildings

Would probably be interesting. The old Concentrator building is 175x220 feet. The new one below is a duplicate of this. The smelter building is 175x490 feet. It required thirty-six tons of iron roofing to cover this one alone. The ore house is 80x220 feet. The new smelter is 131x396 feet. The new building for calcining furnaces is 68x296 feet. There are, all told, thirty-six calcining furnaces, twenty-six matting furnaces and one Bruckner cylinder. Millions of common brick were used in the construction of these, and many hundred thousand of fine brick, all of which, until lately, were imported, making them very expensive; but a quarry has been discovered near Dillon which has all that is requisite for the making of fine brick there, which will be a large saving to the smelting company.

There is a rumor here that the Northern Pacific is intending to build a branch into Butte, and thus connect directly with their line, and I believe preliminary surveys have been made with that intention. If such a thing should be done it would no doubt be a profitable enterprise for them, and a portion of the traffic would be diverted in that way to the profit of the North Pacific Co., and St. Paul merchants and business men also.

I almost think sometimes that our California business men have woefully

Neglected Their Opportunities

In this Territory, as many of the lines that we should be the main supply of have scarcely a representative. It is a well known fact that Chicago commercial men literally run this Territory in almost every line. Probably there may be a discrimination in freights that will account for a portion of it, and I should be glad if it is so, for then there would be a valid reason for it.

Anaconda is well supplied with business houses of all kinds. Hotels and boarding houses are here in profusion, as are saloons, general merchandise, hardware, variety and dry goods stores, bakeries and restaurants. Messrs. Hoge, Browner & Co., of Butte, have a branch bank here to care for the financial interests, and Messrs. Wingard and Thomas supply the Anacondans with fine horses and buggies to take their airings in the valley below. The press is ably represented by the Leonard Bros., proprietors of the *Anaconda Weekly Review*, and are very pleasant gentlemen, on whom I made a number of calls and found them very enthusiastic concerning the future of their town. The town is thus far very healthy and there is no apparent reason why it should not continue so for all future time, as there is enough wind stirring all the time to carry away the fumes from the smelters, and consequently they do not have to suffer with that as most towns do where the smelting interest is represented. The altitude is less than Butte, and vegetables of all kinds can be raised here—in fact it was a farming community before they concluded to build the Anaconda smelter.

Barriers for Debris.

A Suggestion as to their Construction.

EDITORS PRESS:—In the PRESS of Dec. 12, 1885, page 386, there is correspondence on the debris question from the pen of Mr. N. Cadwallader, of San Jose, Cal.

The positions of Mr. Cadwallader as to the benefits to be derived to the people of the State from the starting up of mining afresh, to the labor to be employed, to the materials and sup-

plies to be furnished and consumed, to the vigor that will be infused into other industries from the increased output of gold, are not controverted and will not be denied. The prosperity of one portion of the State is the prosperity of the whole, and a portion cannot be injured without injuring all. Mr. Cadwallader may well hold that if this State was owned by one person, or by one company, mining would not be discontinued from any damage that would be done.

In this correspondence Mr. Cadwallader mentions a plan in which there is an erection of a dam at a suitable place where solid bottom could be obtained. It is submitted that the word dam as used in this connection for restraining mining detritus, is a misnomer and is misleading. As usually understood a dam means some kind of a construction or obstruction to confine or restrain water, or to obstruct or to restrain its flow. We hear and know of dams to confine and restrain water from early youth; hear and know of their breaking away and of great damage being done; and when most men hear or read of dams they associate with them the idea that they are liable to destruction, and to cause the loss of life and property. This is especially so when judges of the great learning and ability of Sawyer and Dady stumble, and make a hotch of their discussion of dams to hold detritus, as shown in their opinions in the Woodruff case.

The above was suggested by an editorial in the *Sacramento Record-Union* of December 29, 1885, headed "A Dam Project," written evidently by one who speaks as by authority, in at least by saying what shall not be done.

But opinions sometimes change with circumstances. Allow me to give another plan which, possibly, the editor, as above, may not characterize as another "Dam Project." Selecting a place on the Yuba, where one bank at least is a bluff from 500 to 800 feet in height, at 300 feet above the bed, channel out the rock horizontally for a distance of 1000 to 1200 feet by 300 feet back, leaving the side of the mountain standing on pillars on a slope of 20 deg. descending toward the stream. Then properly place in round numbers 1,000,000 lbs. of powder at the back of the cutting and in the pillars and explodes all at one instant by electricity. The mountain side could be slid and thrown into the river and the gorge filled. With the advantages that could be taken, 1,000,000 lbs. of powder should easily handle 10,000,000 tons of rock. This, considering the voids or empty spaces, would equal 150,000,000 cubic feet, and would fill a space of 400 feet in breadth by 250 feet in height by 1500 in length—more than a quarter of a mile. The bluffs on the river are to be found in more places than one. The land on the banks of the river to be flowed is of no present or prospective value. The power of thousands of horses runs in ditches near by; labor in great abundance is seeking employment; powder (30 odd carloads) can be brought and a barrier of this kind which for years will act as a strainer can be put in at a cost that would be small compared with the loss of this mines.

Mr. Cadwallader suggests one way; the above is another. It is quite probable that neither is the easiest, cheapest or best. To me it would seem that the true solution of restraining mining and other detritus lies along the line of the suggestions and advice of the late General Alexander, of Colonel Mendell, Captain Eids, and other engineers of deservedly high reputation, who advised the barriers of brush that were placed in the Yuba and the Bear. It was unfortunate that these barriers of brush did not have the advantage of a longer time in their construction, combined with the thoroughness of work by day's pay.

But there are more ways than one even of putting in barriers of brush. The Park Commissioners of the San Francisco peninsula restrain moving sands by vegetation. On the lower reaches of the Yuba where the overflow reaches a width of three or four miles, it would be possible and easy to make the stream level the sands; to plant and to make grow trees, shrubs and brush, notably the alders and willows. Then in October of each year to clip the growth back to a foot or two to wind the clippings among the stumps, and when the winter and spring floods came they would bring down the sands and slums lodging and burying them under the next summer the growth would spring up literally as thick as the hair on the back of a dog. This growth could be carried in a sweeping curve of a half mile wide or more down and from highland to highland. The highest water ever known on the Yuba would not cross a barrier of this kind one foot in depth. At ordinary stages, water could only be seen above and below. This growth would increase in height and strength from year to year, and in time the farmers below would consider themselves safe—much safer than they are now or have been heretofore. If once the farmers could see and know this there is no doubt but that arrangements could be made so that hydraulic mining could be resumed.

French Corral, Cal.

N. C. MILLER.

COSTLY WOOD.—It is said that \$15,000 were once paid by Messrs. Broadwood—the famous English piano makers—for three logs of mahogany from the same tree, each fifteen feet long and three feet and two inches square; that is something over \$33 per cubic foot. The attraction was the unusual beauty of the "hurl," which made it valuable for veneers.

MECHANICAL PROGRESS.

Rotary Engines.

Speaking of rotary engines, the London Engineer of recent date supplies some interesting matter, from which we collate the following:

Watt and his pupil Murdoch produced a number of practical methods, and, though none of their productions were capable of pushing aside the original pattern, each of these able mechanical engineers seemed to think that some kind of rotary engine would eventually be introduced and universally adopted. Hundreds of inventors since their time have devised and patented hundreds of engines, and among those who could not resist the attractiveness of the subject, but have not pursued it as far as the Patent Office, are some of our present foremost engineers. With such a vast number of rotary engines there is a great variety in the shapes and dispositions of the parts of which they are composed. Some of them have rectangular pistons, others have that part which corresponds to the piston in the shape of an eccentric cylinder. Circular pistons depending for their steam-tightness upon centrifugal force, pistons in the form of a sphere, sections of a sphere, inclined planes, have all been adapted. The chamber in which the piston works is shaped to correspond with the particular kind of piston used, and is further complicated by having to be formed so as to provide for the necessary steam and exhaust passages. In the most recent types of these peculiar engines no step toward lessened complication seems to have been made.

In the majority of cases this great fertility has not been attended with any useful result. Practical engineers were naturally curious to know what could be the reason that so much ingenuity and zeal should be so constantly foisted in the endeavor to solve a problem at the first sight of such easy solution. Many writers, taking experience for their guide, denounced the undertaking as impracticable, their chief point being that it was uniformly attended with too much complication of internal parts, which rendered it impossible to make a secure and durable joint.

In this spirit Bourne, in writing of rotary engines, speaks lightly of their originators, and alludes to their notions of the "imaginary imperfections of the direct acting engine." Another eminent writer denounces the engines as "useless machines that have been the means of wasting much capital and thought," and puts aside their designers gently, but firmly, as "would-be inventors that have been warned again and again." Such discouragement, coming from philosophers and engineers, is sufficient to cause any man of inventive ability to hesitate and leave the field of such invention. And such would have been the case had not a new want or quality appeared in connection with the rotary engine, and a new demand for that special attribute. This class of engine seems to have the property of running at great speeds at moderately small powers; and this action is exactly that required for generating electricity for lighting purposes. With this fresh object inventors have returned to the old problem with greater eagerness and hope than ever, and the result has been the production of wonderful specimens of ingenuity, among which are a number of engines of practical use for driving dynamos.

It is the general opinion that in a rotary engine, as the object desired is a more direct application of the steam in turning the shaft, they must therefore necessarily be of a simple construction. The ordinary reciprocating engine is looked upon as a circuitous way of arriving at the desired end, and although in rotary engines there is always a difficulty of keeping the many internal rubbing surfaces steam tight, it is supposed that this mere practical side of the question will be met when metallurgy gives us an unwearable material and engineering a perfect joint.

It is, however, an entire mistake to suppose that any engine worked by a pressed fluid, such as steam or compressed air, can be made, which can possibly work without a reciprocating movement; or that any reduction in the number of working parts takes place below that used in the simple cylinder engine without destroying its efficiency. Some time has elapsed since these facts were foreshadowed by engineers, and definitely enunciated by R.uleaux, and yet we find persons who are either unacquainted with them or disposed to disagree with them.

The chairman, at one of the meetings of the British Society of Arts, said it was a standing disgrace to mechanical science that it had to have recourse to a reciprocating movement when it wished to end with a rotary one. This opinion must have been hastily offered, for if the eminent speaker had considered closely any of the vast number of engines professing to produce rotary motion direct, and that which had been written upon this point, he would have seen that no fluid pressure engine exists which has not a reciprocating movement, either relative or absolute, and which has not, if complete, the same number of working parts in its composition as the much-despised ordinary cylinder engine. Even the inventors of rotary engines seem disposed in many cases to think they have done away with the reciprocating movement, and, however plainly the action occurs in their combination, they tacitly ignore it, as though it were something to be ashamed of.

Metallic Railroad Ties.

The railroads of this country pay \$6,000,000 a year for cross ties. The timber used is oak, chestnut and hemlock in the East, and oak, cherry, locust, maple and ash in the South and West. More than 225,000 acres of forest are needed to supply these ties every year, and consequently the necessities of railroads in this respect alone form a considerable item in the destruction of our forests.

Railroad ties need replacing every three years. In building a new road the estimate is 2700 ties for each mile. It is safe to say that it will require 300 ties per mile per year to keep a road in repair. From 12,000,000 to 15,000,000 new ties are required by the railroads of the United States every year. The annual clearing off of a million acres of timber to supply railroads with ties alone is something that should direct the attention of those who are interested in the important question of protection to forests to the finding of some practical substitute for wooden ties. Fame and fortune await the inventor who will discover such a substitute.

The only practical solution of this question is a resort to metallic ties. The value of steel railway ties under the different climates of the world and the diverging services required is not likely to long remain a mooted question or the sport of theory. They are being extensively put down in India. France is trying them, as is also England; a series of comprehensive tests to be made in New York, and the Dutch railways have just ordered some 70,000 sleepers for trial in that country. After the questions of durability and economy are determined will arise that of the best form for the tie, and scope will be given for a good deal of scientific invention. Concomitant with these will be the establishment of a new industry, the magnitude of which impresses itself upon the mind when the number of railroad ties in use and which are to be replaced is thought of, to say nothing of future expansions of the railway systems of the world. Such an industry would not only consume the surplus iron product, but would stimulate it. It would at the same time relieve the enormous drain on the world's timber resources and prove immensely advantageous in many incidental ways.

At a recent meeting in Paris of the French Society of Civil Engineers, a paper by M. Post, of Holland, upon metallic railroad ties was read. According to the author, the principal advantages inherent in the new system, advantages based on an actual trial of about twelve years in Germany, etc., were: 1. The average durability of the ties remaining in the track after twelve years' use is much greater with metallic ties of good design, than with the best wooden ties. 2. Safety is better guaranteed, as the gauge is better preserved. 3. The expense of maintenance is decreased after the second year of service, while with wooden ties this item increases with the age of the ties. 4. The system is rapidly perfecting, so that the fastenings are made absolutely certain, and less expensive for repair and maintenance than fastenings used with wooden ties. 5. The value of the metallic tie when worn out in service is much greater than the value of an old wooden tie. In summing up these advantages, and combining them with the actual cost of purchase, redemption, and interest, M. Post concludes that no country can exclusively use wood for this purpose with true economy; and he cites Holland as a proof of his assertion, where wood is still easily obtained, and iron is not too plentiful. He says all the Holland companies have adopted the metallic tie.

THE AXE is essentially an American tool. It was always a very clumsy affair, until the skill and accessories of the American hack-woodsmen called for an improvement of the old European tool which was first introduced on this continent. Its form and construction has been made a most careful study, both in theory and practice. There is perhaps no hand-tool in use which has been more improved than the axe. In its study the laws of inertia, of falling bodies and the force of gravitation have all been carefully considered. Experience has proven that the length of handle and weight of iron must be duly proportioned to the stature of the man who is to wield it. Any variations from the proper proportions of man and axe involve a most important result in the amount of work which can be done in a given time. The inventor is not yet done with this useful implement. It is claimed that an axe which can be easier driven and more quickly withdrawn than those of the ordinary construction has recently been patented by W. C. Kelly, of Louisville, Ky. The blade is practically of uniform thickness at that point usually consumed by wear and in grinding. From a central point in the line of juncture between blade and head a bevel or taper extends toward the back and front edges of the blade. The line of taper radiates from its starting point outwardly on both sides and meets the edges at the point of juncture with the cutting edge of the blade. In addition to its increased usefulness the axe is claimed to present a keen and desirable appearance.

FORGING BRASS.—A correspondent of the Scientific American asks: "Can brass be worked in a drop at all? That is, can it be drop-forged the same as iron can?" The journal mentioned replies that soft brass can be worked very well in a deep press, but not to the same extent as hot iron or steel.

SCIENTIFIC PROGRESS.

The Theory of Acids.

All those substances which impress the organs of taste with a sharp, sour and cooling sensation, are in common language denominated acid. Both nature and art present us with many of these bodies, a few of which possess this characteristic in so faint a degree as to be scarcely perceptible, while others are so strongly corrosive as to require large dilution with water, before they can be safely applied to the living animal organs. From the power which acids have of combining with and dissolving almost all bodies, they are of first rate importance and very extensive application to various processes in the arts and sciences; hence they very early engaged the attention of chemists, and have to the present time been the subjects of more experiments than perhaps any other substances.

Acids, according to the corpuscular theory, which explained all chemical phenomena by the mechanical action of the ultimate particles of bodies, were considered as a genus of salts composed of minute and sharp spicula, which readily penetrated into the minute pores of the substances exposed to their action, and thus separated their component parts from each other, while at the same time the acid became neutralized by having its points sheathed in the pores of the body with which it was mixed. This weakness, however, of this theory was demonstrated by Boyle, and by Stahl in his work on salts; and the solvent power of acids was reduced by Macquer, and his contemporaries to the general laws of chemical affinity.

A striking fault of the ancient chemists was their disposition to systematize and draw general conclusions from a few and incorrect experiments; hence they supposed that all combustible bodies were indebted for their common properties to the presence of a combustible element, called by them phlogiston or sulphur. In all the species of metals they recognized a common metallic principle, under the name of unscrupulous earth; so also they imagined there existed a universal saline element or principle of acidity common to all acids. Becher affirmed this acid principle to be composed of water and earth, and therefore not entitled to rank as an element. Stahl was induced to believe that the sulphuric acid was the original one, of which all the rest were only modifications.

The discovery of oxygen gas in 1774, by Dr. Priestly, offered a new and most important substance to chemical investigation, which at length led to an entire change in the theory of the formation of acids. The illustrious Lavoisier, in 1778, presented to the Royal Academy of Sciences at Paris, a memoir on the acid of sugar, in which, after describing the method of preparing this acid from sugar and nitric acid, he concludes that the conversion of the nitric acid into nitrous gas is occasioned by the loss of a portion of oxygen, abstracted from it by the superior affinity of the sugar, which last, in consequence of its combination with oxygen, acquires the characteristics of an acid. The same able chemist discovered soon after, that phosphorus, sulphur and charcoal when inflamed in oxygen gas, combine with the base of this air, acquire an additional weight, equal to that of the gas which disappears, and are severally converted into the phosphoric, sulphuric and carbonic acids. Induced by these facts, he proceeded to generalize the inferences drawn from them, and maintained that the base of oxygen gas was the universal acidifying principle, which by combining with simple or compound combustibles, produced the various species of acids. This explanation has been generally acquiesced in though some objections to it have been brought forward, founded upon the analysis of prussic acid, which appears to consist solely of hydrogen, carbon and azote. The claim, however, of this substance to the character of an acid is very equivocal, as it neither tastes sour, nor alters vegetable colors. With equal or even superior propriety might sulphuretted hydrogen be placed in the list.

Although every combustible body is capable of uniting with oxygen, it is not necessarily an acidifiable base. It is supposed that some bases may be acidified in their several degrees, preserving in each distinct specific characters; hence results an important arrangement of these bodies as they are acidified in the first, second or third degree. The reformed chemical nomenclature has ingeniously distinguished these states by the terminations *ous* and *ic*, and the prefix *oxy* (for oxygenated). Thus, sulphur, at the lowest state of oxygenation at which it acquires acid properties, is called sulphurous acid; when still further oxygenated, it becomes sulphuric acid.—Exchange.

NEW PRODUCT FOR PETROLEUM.—An entirely new product, obtained by the distillation of petroleum, has been perfected by Dr. F. Salathe, of Titusville, which he calls the Oriental potato bog powder. It is non-poisonous, harmless to men or animals, but the most destructive agent to insect life ever discovered.

A VALUABLE MINERAL.—It is recorded that dechenite, or vanadate of lead and zinc, has been discovered in a mine at Helena, M. T. This metal is said to be worth \$22 per gram, or about \$10,000 a pound. A sample has been sent to San Francisco for analysis.

Astronomical.

The heavens just at this time are adorned with three unusually bright stars—Jupiter, Venus and Saturn. The former is the morning star, and those who rise up just before the breaking of dawn will find him a most superb object in the morning sky. He is still approaching the earth, and astronomers are again studying with great earnestness the famous red spot, which, it was reported a short time since, was probably fading out, and would soon disappear. Such is not the case. It is now much more distinctly seen than it was six months ago, though not so dark as the equatorial belt, nor nearly so conspicuous as it was five or six years ago. It is now quite distinctly outlined. This marking has now been observed for seven years, and its present aspect seems to foretell that its existence will be indefinitely prolonged. It may therefore be regarded as a feature of singular permanency. The prospect is that during the coming opposition the red spot will attract general observation. Astronomers have always the excitement that something unexpected may reward their patient work. It is not impossible that during the present year light may dawn upon the meaning of the mysterious red spot, so long an unsolved problem. Amateur observers sometimes find prizes where scientists fail; astronomical triumphs are gained by those who have not yet won their laurels.

Saturn also holds a prominent place in the heavens, and is almost bright enough to dispute the starry sovereignty with his rival, Venus, who holds her court low in the west. Saturn is still in a favorable position for the examination of his rings.

THE RED SKIES are yet, at times, quite prominent in the west. Mr. I. P. Noyes, of Washington, D. C., furnishes a theory concerning the mysterious pink and rose-colored skies, which is by far the most satisfactory of any yet introduced. He declares that these red tints proceed from certain conditions of the atmosphere, and may be just as readily foretold by arbitrary signs as a local storm or a tornado. According to his views, they are simply caused by the combination of a south "high" (barometer) and a north "low." At "high" we have the minimum of moisture, the delicate suspended vapor, which, in conjunction with the necessary amount of heat furnished by a north "low," will always produce the beautiful phenomenon of red or pink skies. Mr. Noyes suggests that anyone who wishes to test the value of this explanation can easily do so by consulting the weather map and familiarizing themselves with the exact atmospheric conditions under which these effects are almost always produced. The cause of their occasional absence under these circumstances is simply due to the fact that the sky is not always clear, even with a "high." The theory is certainly preferable to any offered heretofore, and is probably a correct elucidation of the beautiful rose-colored mystery.

A THEORY OF THUNDERSTORMS.—C. Lieben.—Observations which the author has made by means of small balloons of a very small power of ascending, make it appear probable that thunderstorms are occasioned by ascending, atmospheric currents. Such a mass of air saturated with moisture expands on ascending, and is simultaneously refrigerated. A portion of its watery vapor is therefore condensed, and the latent heat thus set at liberty accelerates the upward movement. The precipitated drops of water are at first very small, and present therefore in their totality a large surface. They are therefore, in the first place, carried along by the particles of air impinging on their lower surfaces. On further condensation they increase in bulk, and fall down through the ascending currents of air towards the earth. Thus, as in Armstrong's steam-electric machine, a powerful friction is set up between the watery vapor of the ascending air and the falling drops. Hence the watery vapor becomes positively electrified, whilst the drops take a negative charge. The author explains the almost invariably positive condition of the atmosphere by the continued friction of the water dissolved in the air against the moist surface of the earth, the surface of the sea, and especially the drops of rain.

BEAUXITE is a valuable mineral for the beds of furnaces and for the manufacture of aluminum; the best comes from Beaux, in the south of France; another variety is found near Belfast, and is largely used in the north of England. Cryolite is used as a flux for the beauxite in the manufacture of aluminum. At one time the cryolite itself was used as the source of that metal. Beaumite consists chiefly of alumina and iron, with a little tartaric acid; the white variety contains 21 per cent of silica. Sometimes beauxite contains enough iron to be regarded as an iron ore. Cryolite, which means "ice stone," is plentiful in Greenland. Its composition is: aluminum, 13; soda, 32.8; fluorine, 54.2. It is fusible in the flame of a candle, giving off some of its fluorine, which is at once transformed into hydrofluoric acid by the moisture in the air.

COAL PRODUCT.—One fifth of all the coal produced in the United States is found in four counties, of which Pittsburgh is the business center. Nearly one-third of the product is converted into coke. There are 100 coke makers, 12,000 ovens, and \$13,000,000 invested. Six thousand men are employed.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Amador Ledger, Jan. 16: Operations at the Mahoney mine have been somewhat delayed on account of the necessity of having two new skips made. They were commenced over a week ago, and will be completed some time next week. They will be 2½ feet across, 10 feet deep, with a capacity of 500 gallons. As soon as the 500-foot level is reached the pumps can be connected, and with pumps and buckets combined the water can be very rapidly taken out. If no serious mishaps occur it is expected to have the mine drained inside of a month after reaching the 500-foot level. It has been decided not to crush any more surface rock, as the ore is so soft that it is difficult to manage in such a heavy mill. A clean-up was made at the Lincoln mill last week, and Mr. Stewart is paying off this week, putting considerable coin in circulation. At the Eureka tunneling in the direction of the old works is to be commenced right away. It is the intention, I believe, to keep a drill hole some distance ahead of the tunnel as the operations approach the old works, which, of course, are full of water. This is a necessary precautionary measure to guard against accident. Messrs. Valentine, Harrington and G. W. Horn took a trip to the head of Lincoln ditch this week. It was found that for lack of attention the capacity of the ditch has been impaired to such an extent that it will have to be enlarged before a sufficient supply of water can be had to run the pumps and mill.

KENNEDY.—Amador Sentinel, Jan. 16: Water is now being raised out of the Kennedy mine in earnest, a bucket holding 530 gallons being constantly on the jump, run by one of Knight's water wheels.

Calaveras.

WEST POINT.—Cor. Calaveras Chronicle, Jan. 16: After diligent inquiry we managed to ascertain that the Keltz mine, situated about 2½ miles in an easterly course from West Point, on the south side of the north fork of the Mokelumne river is now under process of development, under the able management of a gentleman named Peasley. The mine has, in former years, turned out considerable gold, and it only remains to be determined whether the supply has been exhausted or not. Mr. Richardson, of the Star of the West, will resume operations at an early day. We believe parties are now making preparations to commence work on the Water Lily, a mine that has been idle for some time, and formerly known as the French Lead, and is now the property of Mr. J. Gouldson, a young gentleman of some official distinction. The Russell reduction works remain in statu quo. The Valentine mine, on Valentine hill, about one mile east of West Point, has been working for a few days, and Mr. Charles George feels very much elated over the present prospects of the mine, the vein in the bottom of the shaft being quite large and containing gold in the proportion of \$75 to the ton, if not more. Geo. Simpson & Co.'s reduction works, we understand, have collapsed; cause, no dividends; effect, shut down. Whether operations will ever be again resumed, we are unable to say. The Wood House, one of the most promising mines in Sandy Gulch district, and in the same mineral belt as the West Point district, promises fair to become a very valuable property. Negotiations on the Lone Star seem to have dropped through, or at least there is nothing more said about it. All the other stars of this mineral constellation are now idle, and their respective owners are merely "waiting for the turn of the tide."

Inyo.

LEAD CANYON ORE.—Independent, Jan. 16: Last Monday return was had from the recent experimental shipment of ore from Lead canyon, and the result exceeded expectations. There were three different lots of the ore. The first lot or 4726 pounds went 82.35 ounces of silver per ton, and 58 per cent lead. Total value per ton \$117.81. Second lot, 5293 pounds, silver, 72.58 ounces and 58½ per cent lead. Total value \$109.27 per ton. Third lot, 651 pounds, silver, 49.97 ounces and lead 64½ per cent. Total value \$93.06 per ton. This result is so satisfactory that work on the mines will soon be extended and pushed vigorously. A new road across the Inyo mountains, across the Mazurka canyon will be one of the first jobs undertaken. There is every indication of a big camp at Lead canyon.

Nevada.

RELOCATED.—Foothill Tidings, Jan. 14: The Old Kentucky Ridge mine, which had some work done upon it some years ago, has recently been relocated by parties of Grass Valley, and they intend soon to begin work upon the property. All of the surrounding gulches in the vicinity of the Kentucky Ridge have been very rich in coarse gold, and those gulches or ravines must have been fed from some quartz vein. The relocators think they know where the vein is.

IT IS A SALE.—Pioche Record, Jan. 12: We learn from a very reliable source, that the Monitor Mining Company of Taylor has been sold to an English Company, and the price to be paid is in the neighborhood of \$100,000. This amount is to be paid in coin in full—no stock. The property has not changed hands yet, owing to a flaw existing to the title of some of the property. As soon as this is remedied the property will be turned over to its new owners.

Mariposa.

PLACER MINING.—Mariposa Gazette, Jan. 16: We learn from our traveling agent, Joseph Lind, who has just made a run over on Whitlocks, Sherlocks and Colorado and Mono that there are quite a number of placer miners who have taken advantage of the late rains and are washing out gold in greater or lesser quantities, and that all, so far as he could see, were doing well. As an indication of their prosperity, he says, they were all in fine spirits and several of them took special pains to show him the gold in the bottoms of their sluices, sufficient to incite the miner to contribute liberally his strength applied to the pick and shovel with a buoyant hope and a feeling of certainly being rewarded for their

toil and most arduous labor, for some of their claims are among the rocks and boulders which require the use of derricks to remove, underneath of which is usually found the dry dirt containing the precious metal. Among them he saw John C. Felger, commonly known as Dutch John, and Leonard Heinold, who have a claim and are mining on Sherlocks creek just below the falls. They have a string of sluices and a derrick, and, as Dutch John says, they are just making Rome howl when they have water. Charlie Frank, who has a family and a ranch, is mining in his field. The O'Gorman mine and mill on Saxton's creek, known as the "Buena Vista mine," now belonging to Dr. Turner, of Mariposa, is undergoing repairs and being renovated generally. There are six or seven men employed in and about the mill, the main shaft of the mine having been cleaned out and ready for use. Bess Cochran is running an arrastra, grinding quartz on Sherlocks. He has a small vein of quartz which he says yields \$30 a ton. Sam'l Huston and C. V. Dingley have a good placer claim over on Mono. They have at present a good sluice stream of water.

Mono.

BENTON COR.—Inyo Register, January 16th: The Little Emily M. & M. Co.'s mill at Montgomery has shut down, owing to the heavy frost, after a steady run of eight months. W. H. Russell, Superintendent, shipped two large bars of bullion on the 7th. The mill will start up again as soon as the weather is favorable, with plenty of ore on hand.

A number of the miners on Blind Springs Hill have been taking out small lots of ore lately, and prospects are looking very well for 1886.

Shasta.

PLACER AND QUARTZ.—Shasta Democrat, Jan. 13: More machinery arrived from Iron Mountain the past week. Several of the railroad boys have caught the Squaw creek mining fever. Clark & Co.'s mill will be running again next Monday under the superintendency of Mr. J. O. Stewart. Deputy U. S. Mineral Surveyor Graves is up on Squaw creek surveying mining claims for Jack Conant and others. A New River miner struck a fine prospect on the river opposite Middle creek last week. The vein is about four feet wide and shows "noodles" of free gold. Andy Fife has put the Lower Springs mill in operation and it is doing splendid work. John Finley is taking out some fine rock on the Weiser place, which he will have crushed in this mill. Lou Gross and Ned Dix have discovered an old abandoned "pocket" claim in Star gulch which exhibits evidence of worth, and they intend to "see what's in it." In the pitmy days placers were not half worked, and perhaps this was similarly treated, and may still continue a little "snuglet." The engine and boiler for Stocks, Whitton & Co.'s mill on Squaw creek will be shipped the latter part of this week and the rest of the machinery in about ten days. The company has a full force of men at work getting out timbers and excavating ground for the milling machinery, and if fair weather prevails the mill will be crushing rock within 60 days. Simonds & Barnes last week made three more locations on the limestone belt on Squaw creek, from which fair prospects are obtained. This makes seven claims in a bunch, the ore of which, according to the opinion of miners familiar with that class of rock, is identically the same as that of Iron Mountain and the Balaklalla. At any rate, assays from these claims run from \$5 in gold up to \$165, which is indeed very encouraging surface prospects.

NEVADA.

Washoe District.

GOULD AND CURRY.—Virginia Enterprise, Jan. 16: All exploration in this mine and its adjoining coadjutors on both the 1000 and 600 levels heretofore being conducted are discontinued for the present, and work concentrated on the opening of the Osbiston shaft for deeper explorations in both mines, to be conducted to a depth corresponding with the 3200 level of the Combination shaft and the Savage, Hale and Norcross and Chollar on the south. The machinery at the Osbiston shaft will be started into operation to-morrow after a rest of over a year. The shaft has then to be put in good order and repair, when the pumps will be started up to take out the 700 feet of water in the shaft and drain the lower levels, after which sinking deeper will be in order, having to go less than 1200 feet in order to attain the required depth. The Bonner shaft of the Gould and Curry Co. is 1500 feet deep, with an incline from it 200 feet deeper, carrying it to the level of the Sutor tunnel, with which it connects by drift. Air pipes have been put down through the Bonner shaft and carried through in continuous line to the Osbiston shaft on the Sutor tunnel level to supply the necessary air at that depth, until other arrangements can be made at the Osbiston shaft for a more direct air supply.

HALE AND NORCROSS.—The bulkhead on the 2800 level, to stop the strong flow of water from that point will be completed in a day or two. This will shut off some 15 inches of water, or about 250,000 gallons per day, which the hydraulic pump in the Combination shaft heretofore had to handle. The deep winze from the 3000 level is being sunk deeper, and was, last evening, 37 feet below the 3100 level. Its bottom or face is in dry vein matter, carrying good streaks and bunches of ore showing that there is no miscalculation as to the ore body extending below the 3100 level. All indications go to show that the ore makes to the north and the east and will be found concentrated near or north of the Savage south line. This point will, however, be soon developed by the sinking of the shaft and drifts therefrom.

CHOLLAR.—All work now being concentrated in the sinking of the Combination shaft, nothing is being done in the mine. The progress of sinking has been somewhat delayed during the past week, owing to cutting out a station for and putting in a tank just below the 3100 level, to catch up the drainage from that level and above, thus obviating the necessity of pumping it from a lower depth. The Cornish pump will be lowered the coming week to take the water from that point. The water supply driving the big hydraulic pump has been somewhat deficient, owing to heavy freezing weather in the mountains, leakage of flumes, etc., but this difficulty is obviated and the pump operating with full force and effect as before.

OPHIR.—The explorations on the 400 level of the Mexican shaft show no new features of interest to mention, and the same may be said of the new work on the 700 level, consisting of a joint drift, being run

to the northwest from the Ophir shaft, together with the Mexican and Union Companies, which is now 117 feet in length, in vein matter all the way. On the 300 level is a station, being cut out in the Mexican shaft, is nearly or quite completed for a drift west in Ophir ground. This is intended to cut the good ore body known to exist at that level instead of upraising from the 400 level, as heretofore proposed.

CON. CALIFORNIA AND VIRGINIA.—About 300 tons per day is the average product of this mine at present, principally from the 1750 level and the Jones contract section above. The average assays from the Morgan and Eureka mill batteries during the past week were about \$16 per ton. The drift being run to the northwest on the 1650 level is now in 455 feet, and in about three weeks longer will reach the old ore stopes in that direction. On the 1400 level, at the C. and C. shaft, a station is being opened and a drift started north for the same purpose. Bullion valued at \$29,000 was shipped last week.

SIERRA NEVADA.—The joint Mexican and Union drift on the 700 level running northwest is now in 117 feet and making good progress toward the ore section known to exist in that direction. On the 500 level the east crosscut has been advanced to the distance of about 500 feet, and its face should be near the eastern boundary of the lode. The material encountered is still vein porphyry, with occasional streaks of decomposed porphyry and clay.

YELLOW JACKET.—Owing to the cold snap prevailing, freezing the motive power of the Brunswick mill and reducing the ore-crushing capacity, the production from the mine fell off somewhat. The old stopes and breasts in the mine, however, are looking as well as usual, and capable of giving the mill all it can or will take.

MEXICAN.—On the 700 level the joint Mexican and Union drift running northwest was extended 42 feet, making a total length of 117 feet. On the 500 level the north lateral drift from the east crosscut is now in 332 feet, with its face in vein porphyry carrying streaks of quartz and clay.

KENTUCK.—The usual amount of ore continues to come from the old upper levels. As stated in yesterday's Enterprise, Hon. C. Stevenson has resigned from the superintending management of this mine, and nothing definite is stated as to who will be his successor.

CROWN POINT.—There has been something of a falling off in the ore production, owing to the motive power of the mills on Carson river freezing up. Meanwhile exploration and development work goes steadily ahead as usual.

UNION CONSOLIDATED.—On the 520 level the main north lateral drift has been extended 42 feet, making a total length of 1505 feet. The face shows no change in material being a hard, dry vein porphyry formation.

ALTA.—The lateral drift north on the 700 level is progressing steadily ahead, as usual, in good working ground.

Bernice District.

ORE SHIPMENTS.—Sentinel, Jan. 16: During the past week ore shipments were made from the mines of the district to the two reduction works in town as follows: To the Richmond works—Scorpion mine, 3 tons; Wide West, 3; Silver Nugget, 6; Albion, 18, and Continental, 1. To the Eureka Con. works—Dunderberg mine, 32 tons; Reveille, 2½; Morey, 5½.

Esmeralda District.

AT WORK AT AURORA.—Cor. Bodie Free Press, Jan. 16: Answering the prayers of all, and especially gratifying the aspirations of those of the laboring class, who were previously promised employment by the Con. Esmeralda Co., the mandate went forth on the 8th inst., to be on with the boom. Accordingly a few men were set to work in different localities, under the management of mechanical engineer C. E. Ryan and foreman Harry Newton. Since then the number has been steadily increased until it now approximates forty. It was observable to-day that in so short a time a marked change had taken place in the aspect of affairs. At the Humboldt Con., a blacksmith shop and a temporary structure for sheltering windlass men, have been erected, and the hoisting engine and boiler used by the Real Del Monte mining company have been uprooted from the old foundations and removed to the perpendicular shaft, 100 feet in depth and being made a double compartment, near which new foundations have been outlined and their construction begun. A blacksmith shop also has been built at the middle hill tunnel in which a car track is being so rapidly laid that within two weeks it is safe to say it shall have been cleared of the gathered debris and miners will be working in its face about 700 feet from its entrance. General repairs are being made at the Humboldt mill, which is being slightly remodeled for the initiation of a milling process somewhat similar to the one employed by the Noonday Company, in Bodie.

Sacramento District.

NAMING MINES.—Silver State, Jan. 16: There is considerable prospecting carried on in Sacramento District, southeast from Rye Patch, and new leads are being discovered and abandoned claims relocated. One of the new leads has been named "Senator Beck," in honor of the great Kentucky champion, while another lead has been called "Senator Evans."

Pennsylvania District.

THE MILL.—Pioche Record, Jan. 12: There are now fifteen men to work on the mill being erected in this district by G. R. Barton. The last load of the machinery was expected to be unloaded there the last of this week. A two-story boarding house has been erected, with a roof so steep that it looks like a church, and on entering it the men doff their hats, bow low their heads and wear a very humble appearance, and when administered, before meals, a dose of medicine for the purpose of driving away the chills, they praise Him from whom all blessings flow. The mines of the district continue looking well. Everything gives promise of the enterprise yielding substantial benefit to its projectors.

ARIZONA.

LEASED.—Prescott Courier, Jan. 16: We are glad to learn that a lease of the old Senator mine has been taken by Ex-Gov. Tittle and Mr. Frink. The workings are full of water, and many of the drifts have caved in. It has been under consideration to run a 1500-foot drift from the bottom of the hill to

cut the vein at about 700 feet depth. This, though extensive, would drain the mine, and develop a larger ore body than the shaft now reaches. Col. Bigelow and his associates are at work on the Davis mine on Slate creek. They have a considerable amount of ore on the dump, which will go to the Sterling mill for treatment. A large lead of gold-bearing quartz has recently been discovered, two miles west of Walnut Grove. The average is about six dollars per ton. The "110" mine, near Wolf creek, on which a hundred foot shaft and drift was sunk and run by E. M. Clark in 1884, and then abandoned, is now in the hands of lessees who have recently struck a fine body of ore. They are now arranging for having it hauled and worked at the Sterling mill. The extension of the "110" has been taken up by Mr. Hughes, who is engaged with Mr. Cartnell in working the tailings of the old Aztlan mill. The mill has been put in good working order by Mr. Cartnell, who has made a very successful run of the tailings. The stamps will shortly be put to work on rock from Mr. Hughes' recent acquisition. The Messrs. Mahoney are putting up a 30-foot water wheel on their drain, 10 miles down the great canyon of the Hassayampa. They have two valuable gold properties there, one a large ledge of low-grade ore, the other comparatively small, but running high. They propose working ore from the latter in arrastras driven by the wheel, for which they have a good fall and plenty of water. Mr. William Morgan, who owns in the Pine Spring, Victoria and other mines in Turkey creek district, is in Prescott. He gave us to understand that work on the Pine Spring and a great many more claims is progressing favorably. Billy Gavin is sacking very rich silver ore. The Sterling mill will start on another run this morning. Groom creek district, six miles south of Prescott has a good metallic future before it. Its ledges of gold and silver have been pretty thoroughly tested, and some of them are now being worked in good shape.

COLORADO.

HYDRAULICKING.—Grass Valley Union, Jan. 16: W. J. Madden, who was in town yesterday, informed us that about the first of February he will leave San Francisco for the San Juan country, in Colorado, where he goes to take charge of a hydraulic mining property belonging to a Salt Lake company. He goes under engagement for one year and under a liberal salary. Under instructions of the company he has purchased \$1000 worth of hydraulic mining machinery at Marysville, which is to be immediately forwarded to Colorado. The company owns 800 acres of gold-bearing gravel land from 30 to 50 feet in depth, and are now constructing a canal to bring water upon it. Mr. Madden expects to get to work with monitors about the first of April. The company could have made no better selection of a superintendent, as Mr. Madden has had long and valuable experience in hydraulic mining. He has also mining interests of his own in Colorado, from which he expects to realize handsomely.

IDAHO.

ORE.—Ketchum Keystone, Jan. 16: G. McPeters is hauling ore regularly from the Elkhorn to the smelters. The old Elkhorn isn't quite played out yet. The present shipment consists of 100 tons of second-class ore. Wm. Schultz was down from his Boulder mines the first of the week. He has struck rich ore in the Belcher mine. A ten-inch vein with a six-inch ore body of high grade has been found, which grows larger as opened up. Mr. Schultz is much elated over his "find" and predicts developing the Belcher into a second Ophir. Wm. Schultz and Harry Murdock are the lucky owners of the Belcher.

NEW MEXICO.

MILL.—Albuquerque Journal, Jan. 14: Scorro mountain miners can no longer say that they cannot afford to work their properties for want of reduction works to treat the output. The Merritt mill is in full and successful operation, and is prepared to reduce all ore that may be forwarded to the works.

OREGON.

BUSY.—Jacksonville Times, Jan. 16: Miners are busy again, and most of them have considerable water, notwithstanding the late cold weather interfered with the supply. The change in the weather is appreciated by the miner more than anyone else, as the cold snap interfered with mining operations for several days. As much mining has already been done this season as last, and winter has not more than begun; we consequently predict that the miners will do well this time. A portion of the timber for the quartz mill in this place have been sawed out by Parks & Son of the Sterling and hauled here. The machinery will be put in position before long. The mining interests of Wagner creek are developing so rapidly that the O. & C. R. Co. talks seriously of putting in a switch at Talent to facilitate the shipment of ore. Many prospectors are in that region.

UTAH.

STRIKES AT STAR.—Cor. Salt Lake Tribune, Jan. 16: A rich strike occurred last Saturday in the Midas mine in one of the leased shafts. The lucky men are P. T. Cook, Remington and Matherson. The ore body is over two feet wide and assays way up in the hundreds. All the claims in North Star are looking well and lots of ore are being extracted. The new incorporators are putting in shape their sampling mill here to buy ores. This will be a big help to the miners hereabouts. A body of fine quartz has been struck in the New Hope mine in the foothills of Star district, that assays 12 per cent lead, \$33.16 in gold, and 12 ounces of silver per ton. It is one of the best defined ledges in Star district, and has one shaft down 145 feet. It is owned by Judge Boreman and B. A. Spear. From this mine a belt of quartz carries gold in spots as high as \$1000 per ton, i. e., in the Cortez and Esmeralda. Also in the Day Dawn and the Onida Guard. The half of Star district is not known, for every day some new development opens the eyes of the old miners here, and prompts them to exert themselves anew, and in new places on their several claims. The outlook for Star, Lincoln, Beaver Lake and Bradshaw districts is very encouraging.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in Dewey & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING JANUARY 5, 1886.

- 333,713.—ELEVATOR—H. Albert, Crescent City.
 333,754.—GAS REGULATOR—M. J. Amick, Portland, Or.
 333,715.—FRUIT JAR—D. E. Ashby, S. F.
 333,716.—FRUIT JAR—D. E. Ashby, S. F.
 333,717.—FRUIT JAR—D. E. Ashby, S. F.
 333,611.—ORCHARD GUARD—J. B. Daveggio, Paicines, Cal.
 333,507.—COMPOUND ENGINE—W. H. Donaldson, S. F.
 333,625.—DISTANCE INSTRUMENT—Hansard & Tribbey, Oroville, Cal.
 333,755.—MOLDING CONCRETE TUBES FOR CABLE RAILROADS—J. D. Isaacs, Oakland, Cal.
 333,761.—KNIFE CLEANER—L. Lawson, Butte, M. T.
 333,642.—NECKTIE FASTENER—L. Lemos, S. F.
 333,674.—CAR BRAKE—W. H. Masterman, Newark, Cal.
 333,533.—HARVESTER—D. C. Mattison, Stockton, Cal.
 333,773.—DEVICE FOR ROLLING LEATHER—Geo. Middlemas, S. F.
 333,660.—BALING PRESS—T. C. Naramore, Los Angeles, Cal.
 333,883.—COMPOUND FOR PREVENTING RUST—J. F. Nolan, S. F.
 333,958.—LIFTING JACK—E. Nordyke, Heppner, Or.
 333,682.—SQUARE HOLE AUGER—W. Patterson, S. F.
 333,675.—ENGINE OR PUMP—W. C. Salmon, Portland, Or.
 333,676.—FLY TRAP—Benj. Sanford, Smartsville, Cal.
 333,552.—BOMB LANCE—A. Schneider, S. F.
 333,679.—CLASP—A. Schurch, S. F.
 333,555.—ALTITUDE INSTRUMENT—B. B. Sharp, S. F.
 333,562.—SAW TABLE GAUGE—D. W. Standford, Oakland, Cal.
 333,792.—STOP WATCH—John Tixier, S. F.
 333,904.—MACHINE FOR MAKING SCREW THREADS ON PIPE JOINTS—F. F. Voigt, Walla Walla, W. T.
 FOR WEEK ENDING JANUARY 12, 1886.

- 334,211.—PUMP—H. M. Baboon, S. F.
 344,108.—STEAM ACTUATED VALVE—W. M. Cary, S. F.
 334,110.—SPRAY NOZZLE—E. J. Delaney, San Jose, Cal.
 334,384.—AUTOMATIC BRAKE—J. T. Honeycutt, Vancouver, W. T.
 334,120.—ICE MACHINE—A. R. Kenney, S. F.
 334,024.—THRASHER FEED REGULATOR—A. W. Lockhart, Stockton, Cal.
 334,125.—PAVEMENT JOINT MARKER—M. McDonald, Oakland, Cal.
 334,270.—REFLECTOR—J. E. McLaughlin, Portland, Or.
 334,130.—APPLE PARSER, ETC.—W. W. McMillan, Hurlon, Cal.
 334,131.—CALF WEANER—H. W. McNeal, Ferndale, Cal.
 334,028.—SALVE—A. Meyer, Empire City, Nev.
 333,393.—SAW TEETH—Swank & Dages, Big Trees, Cal.

 NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT JAR.—D. E. Ashby, S. F., No. 333,715. Dated Jan. 5, 1886. This invention has for its object the hermetically sealing of canned fruits and vegetables, and it consists of a combination of devices.

CLASP.—Albert Schurch, S. F., assignor of one-half to S. Stemmer. No. 333,679. Dated Jan. 5, 1886. This invention relates to an improved fastening for gloves, shoes or garments, and it consists of a two-part clasp, one portion of which is secured to the meeting sides or edges, and the other to the opposite side, the meeting ends of these parts being so controlled as to interlock when brought together.

STOP WATCH.—J. Tixier, S. F., No. 333,792. Dated Jan. 5, 1886. The invention relates to certain improvements in stop watches; and it consists of a mechanism by which an independent band may be started or stopped at any point in its circuit and returned to the original starting point, this mechanism being so constructed and arranged that the inventor is enabled to dispense with a number of the wheels and springs, which are ordinarily used in this class of mechanism.

APPARATUS FOR ROLLING LEATHER.—George Middlemas, S. F., No. 333,773. Dated January 5, 1886. The device is for rolling leather or packing it closely for storage or transportation. It consists of a roller around which the leather is to be turned, guides in which pins or trunnions at the ends of the roller traverse, and an adjustable weighted or spring mechanism in connection with these guides which allows the roller and its spindles to adjust themselves to the increasing diameter of the roll. It also

consists of belts or bands and the means for operating them whereby the roll is advanced, and in harvesters details of construction.

HARVESTER.—Don C. Matteson, Stockton. No. 333,533. Dated Jan. 5, 1886. The invention relates to certain improvements in harvesters, and to this class in which the heading, threshing and separating and cleaning mechanism are united together by a frame or frames, so that they may be propelled about the field to cut, thresh and clean the grain as they go; and it consists of a header frame adjustably connected with a secondary frame, which in turn is hinged to this side of the threshing, and in certain improvements of the mechanism for raising and lowering the header, and in certain details of construction.

COMPOSITION FOR PREVENTING AND REMOVING RUST.—John F. Nolan, S. F., No. 333,883. Dated January 5, 1886. This is a peculiar composition for preventing the rusting of metal surfaces. It is specially adapted for cutlery and firearms. In using shotguns where there is dampness, as on the marshes, it is very difficult to keep them from rusting. When they get heated, in use, they rust rapidly. To prevent this, the metallic surfaces is first dried and then rubbed with this composition, which is applied by means of a soft cloth. On a surface which has no rust, it will prevent oxidation taking place; and on a surface which has a slight coating of rust, it will remove it.

FRUIT JAR.—Delmar E. Ashby, S. F., No. 333,717. Dated Jan. 5, 1886. This patent differs from the former one allowed to the same inventor July 17, 1885, from the fact that in the former case the rubber packing extended down the side of the jar into the grooves or channel around the upper part of the jar; but in the present invention a ledge with an interior groove is formed upon the top of the jar, upon which the rubber ring is placed, and is compressed upon this upper edge without extending downward along the side of the jar. The center of the cap may have the usual opening and supplemental cap for the introduction of the fruit, and this may be removed or replaced without in any way interfering with the exterior flanged cap and joint.

FRUIT JAR.—Delmar E. Ashby, S. F., No. 333,716. Dated Jan. 5, 1886. This invention has for its object the hermetical sealing of canned fruits, vegetables and other goods. The jar has a groove upon its side and a lip projecting upwardly around the inner periphery of the top, so as to form an exterior ledge in combination with a rubber or elastic ring fitting said ledge; a ring surrounding the upper edge of the jar, having its lower edge turned into the groove or channel, and a cap so formed as to press the rubber upon the ledge and having a downwardly-projecting rim or flange engaging by a folded point a corresponding flange in the annular ring, whereby the two are united and secured.

ELEVATOR.—Henry Albert, Crescent City, Del Norte Co., Cal. No. 333,713. Dated January 5, 1885. The invention relates to the class of elevators and to those appliances or connections by which the cage is caught and held in case the rope breaks. The invention consists in peculiar racks in the elevator shafts, anti-friction guide wheels in the cage, sliding bolts on said wheels, and mechanism dependent upon and operated by the central spring-actuated spindle, to which the lifting strain is applied for projecting and retracting the bolts to cause them to engage with or be disengaged from the racks. It consists, further, in various details of construction and in a peculiar buffer at the bottom of the cage for the purpose of breaking its fall if for any cause it should reach the bottom of the shaft.

FLY-TRAP.—Benjamin Sanford, Smartsville, Yuba Co. No. 336,676. Dated Jan. 6, 1886. This invention relates to that class of fly-traps in which an opaque vessel carrying an external casing of wire gauze is lowered into a pan in which the flies are feeding; and it consists in certain new and useful improvements relating to the lining of the pan with soft dark cloth, a small slide door connecting the exterior or light chamber with the interior or dark chamber, whereby the dead flies are removed; a self-regulating valve or gate in the top of the dark chamber through which the flies pass to the light chamber, and a netting in the dark chamber adapted to be vibrated for the purpose of accelerating the movements of the flies therefrom.

KNIFE-CLEANER.—Ishmael Lawson, Butte, M. T., No. 333,761. Dated Jan. 5, 1886. The object of this invention is to provide a simple device by which knives may be readily and rapidly cleaned. It consists, in a knife-cleaner, of a combination of oppositely rotating parallel rollers upon which the cleaning composition or substance is placed, and adapted to receive and rub the knife blade between them, a traveling carriage moving to and fro between the rollers, and operated thereby in a direction opposite to their direction of revolution, and a clamp for the knife handle to feed the blade between the rollers, said clamp being hinged upon the carriage, whereby it is adapted to be adjusted through a vertical arc to guide the blade to the rollers. Various details of construction and operation are covered by the patent.

THE estimated gold production of Colorado in 1885, exceeded that of 1884 by \$750,000. The production of silver declined \$300,000,

Utah's Metal Product for 1885.

Total Export Value.	\$7,611,829.62

Computing the Gold and Silver at its mint valuation and other metals at their value at the seaboard, it would increase the value of the product to \$16,078,305.65.

Comparative Statement, showing the quantity of the Silver and Gold contained in base bullion produced in Utah:

YEAR.	Total Ounces of Silver Produced.	Total Ounces of Gold Produced.	Ounces of Silver in Ores and Base Bullion.	Ounces of Gold in Ores and Base Bullion.	Per Cent of Total Silver Product.	Per Cent of Total Gold Product.
1877	4,359,703	17,325	2,102,098	11,085	48.2-10	63-4-10
1878	4,357,328	15,040	2,108,339	10,165	48.3-10	67.5-10
1879	3,835,947	15,932	1,797,589	5,603	46.8-10	35.7-10
1880	3,783,566	8,020	1,403,819	2,878	37.1-10	35.8-10
1881	5,400,191	7,055	2,643,899	2,622	48.9-10	32.0-10
1882	5,435,444	6,030	2,581,789	5,016	47.3-10	55.5-10
1883	4,531,763	6,091	2,351,190	5,597	51.8-10	80.
1884	5,069,488	5,553	3,253,984	3,896	57.4-10	68.8-10
1885	5,972,089	8,903	3,189,576	7,289	53.4-10	81.8-10

Comparative Statement of the value of lead bullion, including silver and gold necessarily produced in its manufacture west of the Missouri River, compiled from the annual reports issued by John J. Valentine, Vice-President and General Manager, Wells, Fargo & Co., San Francisco.

YEAR.	Total Value of Precious Metals, including Lead.	Total Value of Lead Bullion, including Gold and Silver Contents.	Per Cent of Entire Product.
1878	\$81,154,622	\$14,740,581	18.1-10
1879	75,349,501	19,234,304	25.5-10
1880	80,167,930	28,114,561	35
1881	84,504,417	30,253,430	35.8-10
1882	92,411,835	35,798,750	38.7-10
1883	90,313,612	34,510,022	38.5-10
1884	84,975,954	31,101,250	36.7-10

The above statement shows a marked annual increase in the percentage of precious metals produced in the manufacture of base bullion. It demonstrates conclusively that the process of smelting is in the ascendant for the reduction of ores, and that any cruises tending to decrease or discourage the production of lead, will produce a corresponding decrease in the gold and silver production west of the Missouri River.

Sierra County Mines.

The drift and quartz mines of Sierra county have yielded well during the past year, and promise to do much better for the new. The Bald Mountain Extension Co., at Forest City, employ about 100 men, and are now working three shifts, eight hours each, in the breasts. More gravel is actually taken out than under the old ten-hour rule. During the last two months of the closing year, \$12,000 in dividends were pocketed by the lucky stockholders, and the prospect is that there will be at least hereafter a regular monthly dividend of \$6000 or ten cents a share on the capital stock. The gold ledge, 260 feet wide, is being followed northeast up the ridge and is believed to extend for miles through a comparatively undeveloped country. Thus far considerably more than a quarter million of dollars has been the gross yield of the channel, whilst the total assessments were only \$57,390. The Bald Mountain, the adjoining drift claim, whose gross yield to date is about \$4,000,000, is still being profitably worked. The Ruby drift mine is yielding good returns, employing quite a number of men. The Alaska Company, Pike City, employ over 100 men, and have a rich and extensive claim. The Sierra Buttes and Young America quartz ledges, at Sierra City, are very rich—especially the latter, recently discovered, with a gross yield of about \$80,000 per month. The numerous adjoining locations promise well for the future. Most of the other mines throughout the county are paying well on an average. This is a desirable field for judicious investment of capital, as under these lava-capped mountains are wide and extensive gold ledges and channels.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Grass Valley Notes.

At Grass Valley they are building a ditch from the Idaho mine to a point on the south side of Wolf creek, just above the Crown Point, for the purpose of conveying water to the Crown Point and Badger mines, and when completed the Badger mine will probably resume work—capacity of ditch 400 inches, length of ditch one and a fourth miles. The work on the ditch has been let at contract for \$825. Mr. Connelly has the contract. The ditch is to be completed about the 20th of February. Chas. E. Uren, C. E., has supervision of the work.

The general prospects of Grass Valley are still improving. A good ledge is now being opened on what is claimed to be the southeastern extension of the Crown Point, a rich looking ledge being intersected by a tunnel 150 feet long, run into the south side of Wolf creek, about 300 yards to the southeast of the Crown Point mill. The ore shows a large percentage of good looking galena and sulphurets, which promise a good mine.

HEINE BOILERS.—The contract for building the four large new boilers for the Lake Merced Pumping Works of the Spring Valley Water Company, to replace those rendered useless by the recent explosion, has been given to the Risdon Iron Works. There was a good deal of competition for this contract. The Risdon Works will furnish the Heine boilers, a type for which they have the agency, and which has given great satisfaction where used. The boilers will be made in the city by the Risdon Works.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

THE CALIFORNIA HOMOEOPATH, with its issue for the current month, enters upon Vol. IV. The handsome editorial pages inform us that Hahnemann College of this city, "the one institution of the coast devoted to the teaching of homoeopathy," is in a thriving condition, and that the physicians of this school in San Francisco have formed a club, whose meetings prove highly enjoyable. Among the contents are three original articles, besides selections of practical bearing.

PRACTICAL HYDRAULICS.

NUMBER 14. COPYRIGHTED.

PRINCIPLES OF HYDRAULICS.

[Written for MINING AND SCIENTIFIC PRESS by P. M. RANDALL.]

Thus, by interpolation, may Table 16 be completed with the approximate values of the coefficient (c_f) of resistance.

TO FIND THE VELOCITY OF WATER FLOWING THROUGH SHORT PIPES.

Rule 33.—Extract the square root of 64.4 times the given head (total head) in feet, divided by 1.505, increased by the product of the length of the pipe in feet, and the coefficient of resistance—coefficient found in and computed from Table 16—due the given diameter, divided by the hydraulic mean radius.

Rule 33 corresponds with Eq. (128).

EXAMPLES AND CALCULATIONS WITH RESPECT TO THE FLOW OF WATER THROUGH SHORT PIPES.

Ex. 66.—A pipe being 1 foot in diameter, 10 feet long, and the head of water being one hundred feet, what will be the velocity of flow per second?

Cal.—As the pipe is very short, it is evident that a large portion of the head will be expended in generating the velocity. Let it be assumed that not less than one-half the total head will be so expended. In which case the velocity will exceed 50 feet per second. Turning to Table 16, we perceive that the coefficient of resistance due a velocity of 16 feet in a pipe 1 foot diameter is .0049, and that the decrease of the preceding coefficients in the 1 foot diameter column, corresponding to the increase of velocity, is very small. Let, then, the least coefficient in column be taken, $c_f=.0049$.

Hydraulic mean radius $r=\frac{1}{4}$.

Substituting these values of $c_f=.0049$, $r=\frac{1}{4}$; also, the values of $2g=64.4$, $h=100$ feet, and $l=10$ feet in Eq. (128); or, in other words, apply Rule 33:

$$v=\left\{\frac{64.4 \times 100}{1.505+.0049 \times 10 \div \frac{1}{4}}\right\}^{\frac{1}{2}}$$

Whence, $v=61.53$ feet.—Ans.

It will be remembered that equation (128), or Rule 33, is to be employed in finding the velocity when the given length of the pipe is less than one thousand times its diameter.

Ex. 67.—The head being 10 feet, what will be the velocity of water flowing through a pipe 2 feet in diameter and 1000 feet long?

Cal.—Assume by way of trial that the velocity will be 9 feet per second.

By Table 16, the coefficient of resistance due 9 feet velocity in a 2-foot pipe is $c_f=.0045$.

Hydraulic mean radius $r=\frac{2}{4}=\frac{1}{2}$.

Substituting the values of $c_f=.0045$, $r=\frac{1}{2}$, $h=10$, $l=1000$, and $2g=64.4$, in equation (128); or applying Rule 33:

$$v=\left\{\frac{64.4 \times 10}{1.505+.0045 \times 1000 \div \frac{1}{2}}\right\}^{\frac{1}{2}}$$

Whence, $v=7.83$ feet, trial result.

Turning again to Table 16, we find that, corresponding to 8 feet velocity nearest approximate to our trial, result 7.83 feet, the coefficient of resistance is $c_f=.0045$, the same as employed in our calculation.

Therefore we have:

$$v=7.83 \text{ feet.} \text{---Ans.}$$

Had the tabulated coefficient of resistance corresponding to the velocity found by trial, not have been equal to, or closely approximate to, that employed in our calculation, it would have been necessary to repeat the operation, using this new coefficient.

Ex. 68.—The head being 20 feet, the pipe 4 feet diameter, and 4,000 feet long, what is the velocity of flow per second?

Cal. 1st.—Assume the velocity for the purpose of trial 9 feet. Then:

By Table 16, $c_f=0.035$.

Hydraulic mean radius $r=\frac{4}{4}=1$.

Substituting the values of $c_f=.0036$, $r=1$, $h=20$ feet, $l=4,000$ feet, and $2g=64.4$ in Eq. (128); or applying Rule 33:

$$v=\left\{\frac{64.4 \times 20}{1.505+.0036 \times 4000 \div 1}\right\}^{\frac{1}{2}}$$

Whence, $v=8.999$ feet.—Ans.

Cal. 2.—Employing formula (130), which is for a long pipe, there results:

$$v=\left\{\frac{64.4 \times 20}{.0036 \times 4000 \div 1}\right\}^{\frac{1}{2}}$$

Whence, $v=9.428$ feet.—Ans.

Comparing these results, the difference is seen to be .429 feet velocity per second. It appears quite evident, then, that 1.505, the first term in the denominator of the right hand member of Eq. (128)—an equation for velocity of water in short pipes—cannot be omitted, where accuracy is required, even if the length of the pipe, as in the given example, is 1,000 times the diameter.

Ex. 69.—The head being 12 feet, the pipe 15 inches diameter, 1,200 feet long, let it be required to find:

- The velocity of flow per second;
- The discharge in cubic feet per second;
- The loss of head due velocity;
- The loss of head due resistance of entry;
- The head expended in overcoming the resistances within the pipe;
- The sine of slope;
- The fall per mile due resistances in pipe;
- And the total fall per mile.

Cal.—Assume by way of trial the velocity of flow=6 feet per second.

By Table 16, the coefficients of flow due a velocity of 6 feet in a 12-inch pipe, are $c_f=.0053$; and in a 24-inch pipe, $c_f=.0046$.

The hydraulic mean radii are as follows:

$$\text{For } 12", r=\frac{1}{4};$$
$$\text{And for } 24", r=\frac{3}{4}=\frac{1}{2}.$$

Substituting the values of $c_f=.0053$, and of $r=\frac{1}{4}$, in Eq. (133); also, the values of $c_f=.0046$, and of $r=\frac{1}{2}$ in the same equation, there results:

$$m+4n=.0053. \quad (a)$$

$$m+2n=.0046. \quad (b)$$

$$\text{Whence, } n=.00035. \quad (c)$$

Substituting value of (n) in Eq. (a),

$$m=.0039. \quad (d)$$

Substituting the values of m of (d), and of n of (c) in Eq. (133),

$$c_f=.0039+\frac{.00035}{r}. \quad (e)$$

The hydraulic mean radius due 15", $r=\frac{5}{16}$.

Substituting this value of $r=\frac{5}{16}$ in Eq. (e),

$$c_f=.0039+.00035 \div \frac{5}{16}=.0050. \quad (f)$$

Substituting the values of $c_f=.0050$, $r=\frac{5}{16}$, $h=12$ feet, $l=1,200$ feet, and $2g=64.4$, in Eq. (128), or applying Rule 33,

$$v=\left\{\frac{64.4 \times 12}{1.505+.0050 \times 1200 \div \frac{5}{16}}\right\}^{\frac{1}{2}}$$

Whence, $v=6.11$ feet.—Ans. (h)

The value of v of Eq. (h) is so near the assumed value, 6 feet, it will be unnecessary to repeat the operation for finding a nearer approximate to the true value.

Area of cross-section of given pipe,

$$a=(\frac{1}{16})^2 \times .7854=1.227 \text{ square feet.} \quad (i)$$

Quantity of flow is equal to the product of the area of cross-section and the velocity; hence,

$$Q=av=1.227 \times 6.11=7.5 \text{ cubic feet.} \text{---Ans.} \quad (j)$$

To find the loss of head due velocity, substitute the value of v of Eq. (h), and the value of $2g=64.4$, in Eq. (110),

$$h_v=(\frac{v}{2g})^2=.58 \text{ feet.} \text{---Ans.} \quad (k)$$

To find the loss of head due the resistance of entry, substitute the value of $c_e=.505$, of Eq. (127), and the value of $h_v=.58$, of Eq. (k), in (116),

$$h_e=.58 \times .505=.29 \text{ feet.} \text{---Ans.} \quad (l)$$

To find the head expended in overcoming the resistances within the pipe, substitute the values of $h_v=.58$ of Eq. (k), of $h_e=.29$ of Eq. (l), and of $h=12$ feet, the total or given head in Eq. (108), and transposing:

$$h_f=12-.58-.29=11.13 \text{ feet.} \text{---Ans.} \quad (m)$$

To find the sine of slope, divide the head, h_f , expended in overcoming the resistances in the pipe by the length of the pipe. Thus, the sine of the angle of slope, C E D, Fig. 19, is in the given example:

$$s=\frac{h_f}{l}=\frac{11.13}{1200}=.009275. \text{---Ans.} \quad (n)$$

To find the fall per mile:

$$\text{Let } F=\text{fall in feet per mile:}$$
$$1 \text{ mile}=5280 \text{ feet.} \quad (o)$$

$$\text{Then } 1:.009275::5280:F. \quad (p)$$

Whence, $F=48.972$ feet.—Ans. (g)

When 1.505, the leading term in the denominator

of Eq. (128), or, in other words, when Eq. (130) is employed instead of Eq. (128), it is assuming that in Fig. 19, A E is the slope or hydraulic gradient instead of C E, which is erroneous.

But when the pipe is very long in comparison with its diameter, the error is insignificant.

Let F_m =the entire fall per mile.

Substitute the values of $h_v=.58$ of Eq. (k), and $h_e=.29$ of Eq. (l) in Eq. (109),

$$h_i=.58+.29=.87. \quad (r)$$

$$\text{Then } F_m=F+h_i=48.972+.87=49.842 \text{ feet.} \text{---Ans.}$$

FLOW OF WATER IN LONG PIPES.

For a given or determined velocity, the inlet head (h_i), remains constant, regardless of the length of the pipe.

In general, if (F) denote the fall per mile—fall requisite to overcome the resistances within the pipe—(n) the number of miles, length of the pipe, and F_i the total fall, then will

$$F_i=nF+h_i=h_f+h_i. \quad (a')$$

In the computation of the following table for the velocity and quantity of flow in long pipes, Eq. (130), in which the value of $s=\frac{h_f}{l}$ is given, has been employed. The inlet head, (h_i), if required, will be determined from the velocity.

TABLE 17.

Velocities and Quantities of Flow in Clean Iron Pipes due given Slopes and Diameters.

Fall per Mile.	Sine of Slope $s=\frac{h_f}{l}$	DIAMETERS.							
		1 1/2"=.03125 feet.		2"=.04167 ft.		3"=.0625 ft.		4"=.1067 ft.	
		Veloc'y Ft. per Sec.	Cubic Feet per Sec.	Veloc'y Ft. per Sec.	Cubic Feet per Sec.	Veloc'y Ft. per Sec.	Cubic Feet per Sec.	Veloc'y Ft. per Sec.	Cubic Feet per Sec.
21.12	.004
26.40	.005
31.68	.006
36.96	.007
42.24	.008	1.04	.0057

ENGINEERING NOTES.

The Panama Canal.

The difficulties connected with the construction of the Panama canal, appear to be fast culminating. Evidence accumulates which appears to show that the engineering difficulties in the way of maintaining the existence of the canal after it is finished are quite as great, if not greater than in the way of its construction.

It appears that the average annual rainfall on the line of the canal is over 12 feet, and all of this deluge falls during a period of about six or seven months. At times six inches of rain falls in six hours, causing the Chagres river to rise from a stream of two feet to a torrent of 40 feet deep, its width increasing from 80 to 500 yards. During these floods 10,000,000 cubic feet of water pass a given point every minute.

The sea level canal would of necessity be the receptacle of all this water, together with the water from all other neighboring streams, large and small, and it behooves count De Lesseps to carefully consider what he will do with it. Now bear in mind that this flood carries with it huge trees, "villages of houses," "rocks" and "masses of vegetation."

In view of the accumulation of present and anticipated difficulties, it was recently reported that the French Government will, at the request of the Panama Canal Company, send Rousseau to inspect and report on the conditions and prospects of the canal. If the report is favorable a loan will be granted so as to push the work to completion. If it is adverse the enterprise will be allowed to collapse and the Government will assume the responsibility.

A still later report is to the effect that De Lesseps himself will go to the isthmus in company with a Government deputation of engineers. He also invites the presence there of engineers from other countries—particularly England and the United States, to consider upon what is best to do under the circumstances with which the project is surrounded.

ENGINEERING BY THE ANCIENTS.—At the meeting of the British Association, the president of the section on mechanical science, B. Baker, civil engineer, recalled certain engineering feats of the ancients: "I have no doubt that as able and enterprising engineers existed prior to the age of steam and steel as exist now, and their work was as beneficial to mankind, though different in direction. In the important matter of water supply to towns, indeed, I doubt whether, having reference to facility of execution, even greater works were not done 2000 years ago than now. Herodotus speaks of a tunnel, eight feet square and nearly a mile long, driven through a mountain in order to supply the city of Samos with water, and his statement, though long doubted, was verified in 1882 through the abbot of a neighboring cloister accidentally unearthing some stone slabs. The German Archaeological Society sent out Ernst Fabricius to make a complete survey of the work, and the record reads like that of a modern engineering undertaking. Thus, from a covered reservoir in the hills, proceeded an arched conduit about 1000 yards long, partly driven as a tunnel and partly executed on the 'cut and cover' system adopted on the London underground railway. The tunnel proper, more than 1100 yards in length, was hewn by hammer and chisel through the solid limestone rock. It was driven from the two ends like the great Alpine tunnels, without intermediate shafts, and the engineers of 2400 years ago might well be congratulated for getting only some dozen feet out of level and little more out of line. From the lower end of the tunnel branches were constructed to supply the city mains and fountains, and the explorers found ventilating shafts and side entrances, earthenware socket pipes, with cement joints, and other interesting details connected with the water supply of towns."

FROM LONDON TO BOMBAY.—The vast scheme of a railway route from London to Bombay is being discussed by eminent French and British engineers. According to statements made the whole of the journey will be accomplished by train, save the passage of the Channel and the crossing of the Straits of Gibraltar. From Tangier the railway would run across Morocco and make a junction with the Algerian lines, afterward continuing by Tunis and Tripoli to Cairo; thence the line would continue along the Euphrates Valley and the shores of the Persian Gulf to Kurrachee, the extreme westerly point of the Indian railway system. Quick trains would, it is stated, cover the distance between London and Bombay in nine days.

EADS SHIP RAILWAY.—The proposed subsidy to the Eads Ship Railway Company amounts to a guarantee of two-thirds of its estimated revenue for fifteen years, Mexico having already guaranteed the other third. If money should be advanced under this guarantee the company is required to pay it. The cost to the Government, if all should go well, would be nothing; but if the project should be an engineering failure, or if the company should fail to earn anything or repay any of the advances, the United States might be called upon for \$2,500,000 per annum for fifteen years, or \$45,000,000 in all. This is the extreme limit of liability, to be lessened by two-thirds of the net earnings, whatever they may be.

USEFUL INFORMATION.

GLASS PASTE OF THE ANCIENTS.—The ancients found or attempted to find, whatever the difficulty of the undertaker, all things that could afford either beauty or variety to man's eye. They discovered glass, and they carried the art of making it to a perfection which their posterity are very far from ever having attained. The most useful of these works of the ancients was certainly the glass paste with which they so exactly imitated the most precious engraved gems, either in cameo or intaglio. Nor was it only in small pastes that the ancients exercised this talent and their ingenuity; for from the fragments of uncommon dimensions which have been found we can see what expertness the ancients had acquired even in large works of this kind. As an instance—the large cameo in the Bibliotheca Vaticana, described by Winklemann; on it, in a not much raised basso-relievo, are represented several white figures, Bacchus and Ariadne with two satyrs, on a very lively deep azure ground. This specimen is, in its oblong shape, more than a Roman foot long, and two-thirds of a foot wide. Another basso-relievo, a foot longer, in three compartments, in which are the little statue of Apollo and those of two Muses, is mentioned by Passeri, and Olivieri deems it the work of a most eminent artist. It is, moreover, certain that these cameo or glass pastes were affixed on the walls of temples and houses. This is the more likely, says Reiffenstein, as whole pavements of rooms have been found entirely worked in these glass pastes, and they may be considered to have been frequently used in mosaics; for the artists, particularly if they had to represent leaves or flowers, borrowed from the glass pastes the beautiful colors they could not find among the stones of which they made use.

FINE WORK WITH SAND.—We should infer from what we have seen and heard that every workman should have a few grains of sand mixed with a little grindstone dust in fitting up the parts of machinery. Gear wheels are ground on their shafts when the bore of the wheel has been left tapering by the wearing away of the boring tool and left with such a close fit that the key could not be driven till the wheel worked loose, and it is just the stuff to grind out a loose pulley where it is not loose enough on its shaft to rattle. The hardest metal can be cut without drawing the temper by using this mixture on a saw made of soft iron. Not only this but the mixture comes in handy in setting up the machine where the parts are fitted. All there is to be done when a piece of iron is to be marked in order to drill a hole, is to chalk over the surface where the hole is to be drilled, place the casting over it and sprinkle down the hole of the casting a little of the granular mixture, while a worn-out tool is rattled about in the bore to knock the grains into every portion of the aperture. This dusted surface on a ground work of chalk stands out in bold relief, and the most timid workman would not hesitate to mark with the prick-punch for the exact center of the hole that is to be bored on the drilling machine.

IS WATER FATTENING?—It has been observed that water is fattening, that those who drink large quantities of water have a tendency to fullness and rotundity. That there is considerable truth in this observation the *Medical and Surgical Reporter* fully substantiates. That excessive imbibition of very cold (iced) water (especially when one is very warm) is not to be recommended, yet we have reason to believe that the unlimited use of pure spring water, at its natural temperature, is not only very conducive to health, but has an actual tendency to favor a fullness and roundness of body. Whether this is the result of a better action on the part of the digestive, assimilative, and depurative functions, owing to the internal cleanliness or flushing of the human sewers produced by large quantities of water, or whether water has some specific action in producing this fullness, we do not know, neither does it signify, since observation confirms as a fact that the free use of water does have this effect.

METHODS OF RESTORING OLD LACE GOODS TO THEIR ORIGINAL COLOR.—The following singular method of treating old and valuable lace goods so as to restore them to their original shade of color and condition is said to have been one of the secret processes used by Parisian dyers, but now made public in the *Farber Zeitung*. The lace is lightly ironed to smooth it, then folded with care and sewn up in a linen bag, which is then suspended in pure olive oil for 24 hours; the oil drained off without disturbing the lace, and then at length her placed for 15 minutes in hot soap and water, then in warm water, and lastly in cold water containing a little boiled starch, and again drained. The lace is now taken out of the linen bag and dried in a stretched state upon frames provided with needles.

CRUSHING RESISTANCE OF BRICK.—Walls laid up of good, hard-burned bricks, in mortar composed of good lime and sharp sand, will resist a pressure of 1500 pounds per square inch, or 216,000 pounds per square foot, at which figures it would require 1600 feet high of 12 inch wall to crush the bottom courses, allowing 135 pounds as the weight of each cubic foot. Walls laid up in same quality of brick and mortar, with one-third Portland

cement added, will resist 2500 pounds per square inch, or 360,000 pounds per square foot, which would require a height of wall 2700 feet to crush the bottom bricks.

THE CAMERA IN A NEW ROLE.—Practical reformers, who have been trying to abolish low concert saloons, and other vicious resorts in New York City, have met with opposition from the very people who are presumably their helpers. About some of these places there is sufficient of the ward politician's influence to make even the policeman a consenting party; and consequently he is sometimes quite oblivious to violations of the law which are plain enough to everybody else. This state of affairs has led the reformers to turn to the more reliable testimony offered by a good photograph. The saloons are brilliantly lighted by electricity as a rule, and the reformer, armed with a pocket camera and instantaneous photographic plates, has succeeded in taking over 100 views of the saloons and streets in front of them after one o'clock in the morning when the law provides that they shall be closed. A number of the photographs contain clock dials, which thus offer testimony as to the hour.

ANOTHER IMITATION.—The advancement of sciences has been so rapid in the last fifty years that no one can foretell what changes the future has in store for us. Man has, or pretends that he has, made many improvements over nature. In fact nature seems to be playing an unimportant part in furnishing the basis for our modern food supply. If the goddess of nature should suddenly eliminate the maple from the catalogue of trees, does any one think for a moment that the world would be left without maple sugar? If there is any one so foolish as to think so, he is not acquainted with the resources of the modern man. Listen! A patent has been secured for making imitation maple syrup. Here is the way it is done: Hickory bark is soaked in water and an extract is thus obtained, which, added to cane or glucose syrup, gives it the maple taste and smell.

BLEEDING AT THE NOSE.—The *Scientific American* says the best remedy for bleeding at the nose, as given by Dr. Gleason at one of his lectures, is in the vigorous motion of the jaws as if in the act of chewing. In the case of a child a wad of paper should be inserted to chew it hard. It is the motion of the jaws that stops the flow of blood. This remedy is so very simple that many will feel inclined to laugh at it, but it has never been known to fail in a single instance, even in the severest cases.

A BELT TRAVELING 800 FEET PER MINUTE will safely transmit one horse power for each inch in width if the pulleys are both the same diameter and the belt laps over one half of each; but if the belt laps on but one-quarter of either pulley's circumference, then it would have to travel 1230 feet per minute to transmit a horse power for each inch in width.

GOOD HEALTH.

ABSENT MINDEDNESS AND LUNACY.—There are many firm believers in the theory that most people are crazy at times, and facts seem to support their belief. A wise man will step backward off a porch or into a mud puddle; a great philosopher will hunt for the specks that are in his hand or on his forehead; a hunter will sometimes shoot himself or his dog. A working girl had been feeding a great clothing knife for 10 years. One day she watched the knife come slowly down upon her hand. Too late she woke out of her stupor, with one hand gone. For a few seconds her mind had failed, and she sat by her machine a temporary lunatic, and had watched the knife approach her own hand. A distinguished professor was teaching near a canal. Walking along one evening in summer, he walked as deliberately into the canal as he had been walking along the path a second before. He was brought to his senses by the water and mud and the absurdity of the situation. He had on a new suit of clothes and a new silk hat, but though the damage was thus great, he still laughs over the adventure. Our mail collectors find in the iron boxes along the streets, all sorts of papers and articles which have been put in by some hand, from whose motions the mind has become detached for a second. A glove, a pair of spectacles, a deed, a mortgage, a theater ticket goes in, and on goes the person, holding on to the regular letter which should have been deposited. This is called absent-mindedness, but it is really a brief lunacy. A lunatic is a person whose mind is constantly out of balance. Such is the only difference between lunacy and absent-mindedness.

WHAT TO DO WITH AN HYSTERICAL WOMAN.—When a woman is attacked with hysterical excitement don't begin by trying to bully her into keeping quiet, which will excite her the more; nor pester her by telling her how she is annoying others. The patient is the first thing to be thought of; let her feel that you are doing everything for her comfort and she will be grateful and struggle to aid your efforts. If possible, clear the room of other people, so that they may not annoy her. Open the window and let the air blow over her face. Bathing the face and hands with cold water relieves the faintness; aromatic spirits of ammonia sprinkled on a cloth and laid on the chest is good. If

held too close to the nostrils it causes instead of relieving oppression in breathing. Try to relieve the mind of the patient of any anxiety; she should be soothed into a state of perfect mental calm. If she does not seem to be getting better medicine should be administered.

THE CHEMISTRY OF FOOD.—There is no reason why every housekeeper and cook should not have a knowledge of the chemistry of cooking, and of the healthfulness of certain articles of food. At this particular season of the year, nature supplies us with much that is cooling in the way of fruit and summer vegetables, which are not only delicious articles of food, but are really health preserving, for often a slight indisposition of children, or older persons, can be readily cured by the free use of these culinary remedies. Spinach has a direct effect upon complaints of the kidneys, the common dandelion, used as greens, is excellent for the same trouble, asparagus purifies the blood, celery acts admirably upon the nervous system and is a cure for rheumatism and neuralgia, tomatoes act upon the liver, beets and turnips are excellent appetizers, lettuce and cucumbers are cooling in their effects upon the system, beans are very nutritious and strengthening vegetable, while onions, garlic, leeks, chives, and shallots, all which are similar, possess medical virtues of a marked character, stimulating the circulatory system and the consequent increase of the saliva and gastric juice promote digestion. Red onions are an excellent diuretic and the white ones are recommended eaten raw as a remedy for insomnia. They are tonic and nutritious. A soup made from onions is regarded by the French as an excellent restorative in debility of the digestive organs. We might go through the entire list and find each vegetable possessing its especial mission of cure, and it will be plain to every housekeeper that a vegetable diet should be partly adopted at this period of the year, and will prove of great advantage to the health of the family.—*Good Housekeeping*.

A RAPIDLY GROWING HEALTH EVIL.—The American Inventor thinks that it is not generally known that coal oil and gasoline stoves rapidly vitiate the air of a room for breathing purposes by the development of large quantities of carbonic dioxide. How much longer must this continue before manufacturers of such goods will obviate this new danger by inventing some form of hood and pipe for conveying this poisonous gas to the outside atmosphere? Volumes have been written concerning the ventilation of homes and the injury that arises, especially to children and the infirm, from crowding too many people together in closed apartments, and now, with the introduction of oil and gasoline stoves in the household, a new difficulty presents itself, which is not easily remedied, in the endeavor to provide for health and comfort. These stoves are frequently found with several large burners in full blast, in small kitchens hardly large enough to contain air to supply the healthful requirements of one person. Evils of this kind, where they are widely spread, must have a terrible effect upon the strength of a population who breathe every day such an atmosphere, and, thus far, we have seen no remedy. It is certainly a question for grave consideration, and whoever takes the problem in hand at once, and provides a means, at low cost, to obviate this nuisance, will confer a great benefit upon thousands who are innocently undermining their health.

MIND AND DISEASE.—The influence of the mind upon the body, for sickness or health, is beyond all estimation. For a person to think he has a disease will often produce that disease. This we see effected when the mind is intensely concentrated upon the disease of another. It is found in hospitals that surgeons and physicians who make a specialty of a certain disease are liable to contract it themselves, and mental power is so great that sometimes people die of diseases which they only have in imagination. Well persons to remain well should remain cheerful and happy, and sick persons should have their attention drawn as much as possible from themselves. It is by their faith men are saved, and it is by their faith men die. If he will not die he can often live in spite of disease, and if he have little attachment for life he may slip away as easily as a child will fall asleep.

PRACTICAL OBSERVATION ON VACCINATION.—The following is from the report of one of the chief smallpox hospitals in the vicinity of London, England. Of 2000 who died of smallpox at the hospital, one-twelfth had a single indifferent scar. Of that number of imperfectly protected individuals, four per cent died. Of 1446 who had two good scars, only two per cent died, while of 518, who had three good scars, only one per cent died, and of 544 who had four or more good scars, only one-half of one per cent, or one in 200 died. No one should trust to a single scar, or even two. With one more good scar, the chances of taking the smallpox are almost as good as in cases where the patient has suffered from the genuine smallpox itself.

TENSION OF BLOOD VESSELS.—Experiments reported to the Paris Academy of Sciences prove that the pressure necessary to cause the rupture of blood vessels is very much greater than that to which they are normally subjected. The carotid artery of a dog required from 35 to 55 times the normal pressure of the blood, and the jugular vein from 32 to 35 times the usual force.

SAN FRANCISCO:

Saturday Morning, Jan. 23, 1886.

TABLE OF CONTENTS.

EDITORIALS.—Prehistoric History; Our Roasting Kites; Our Mining Review, 73. Passing Events; The Mining Industry in 1885, 76.

ILLUSTRATIONS.—Furnaces for Roasting Ores; Indian Records on the Rocks in Nevada, 73.

CORRESPONDENCE.—Formation of Mineral and Metalliferous Veins; Montana Mines; Barriers for Debris, 54.

MECHANICAL PROGRESS.—Rotary Engines; Metallic Railroad Ties; Forging Brass, 55.

SCIENTIFIC PROGRESS.—The Theory of Acids; New Product for Petroleum; A Valuable Mineral; Astronomical; The Red Skies; A Theory of Thunderstorms; Beauxite; Coal Product, 55.

ENGINEERING NOTES.—The Panama Canal; Engineering by the Ancients; From London to Bombay; Eads Ship Railway, 59.

USEFUL INFORMATION.—Glass Paste of the Ancients; Fine Work with Sand; Is Water Fatening; Methods of Restoring Old Lace Goods to their Original Color; Crushing Resistance of Brick; The Camera in a New Role; Another Initiation; Bleeding at the Nose, 59.

GOOD HEALTH.—Absent Mindedness and Lunacy; What to do with an Hysterical Woman; The Chemistry of Food; A Rapidly Growing Health Evil; Mind and Disease; Practical Observation on Vaccination; Tension of Blood Vessels, 59.

MINERALOGY.—Practical Hydraulics, 58.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 56-7.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 72.

Business Announcements.

Worthington Pumps—A. L. Fish.
Powder—Vulcan Powder Company.
The Kidron Iron and Locomotive Works.
National Compressors—Edward A. Rix & Co.

Passing Events.

The storm which prevailed along the coast this week was the worst we have experienced for some years as far as wind was concerned. It was predicted by the Signal Service so that vessels in the port did not put to sea. The storm-warning flag was displayed for the first time in California.

We issue this week a double sheet number of the PRESS containing our annual review of mining operations for the year past, with statistics of production, etc.

Colorado is showing a notable advance in gold production with prospects of an increase. That State is now second to California in this respect.

Renewed efforts are apparent all over this State in gold quartz mining and drift mining. It would appear from present evidences that 1886 will see a marked increase of product of gold from both these sources.

THE PLUMAS, EUREKA and SIERRA BUTTES paid semi-annual dividends in April and October. Both are California mines, but are owned in England. The Bird's Eye Creek of California and Richmond Consolidated of Nevada, are also owned in England. The former paid semi-annual dividends in June and December, and the latter an annual dividend on the 2d December.

THE MINING INDUSTRY IN 1885.

A Review of Operations and Results.

A Summary of Important Doings in the Mining Regions Last Year.

In reviewing the various mining operations carried on the past year throughout the Pacific States and Territories, our remarks must necessarily be of a general character, the great extent of country to be gone over, the diversified nature of these pursuits, and the multitude of mines now being worked rendering anything like a detailed description thereof impossible in a paper of this kind. Besides gold and silver, copper, lead, coal, iron and quicksilver are all being mined on an extensive scale in these west-lying regions, several other of the useful metals and minerals being also produced in a greater or less quantity. These several countries, all included, comprise an area of nearly a million square miles, to say nothing of Alaska, larger, perhaps, than all the others put together.

In comparing the bullion product of 1885 with that of 1884 the following, according to the annual reports of Mr. Valentine, the following appear to be the losses and gains made by the countries mentioned: Nevada shows a gain to the extent of \$324,182; Oregon, \$52,238; Washington, \$38,925; Alaska, \$135,986; Idaho, \$881,179; Montana, \$2,362,512; Utah, \$1,536,888; Colorado, \$1,138,251; and New Mexico, \$165,149. California shows a loss to the amount of \$236,316; Arizona, \$461,133; Dakota, \$360,224; Northwestern States of Mexico, \$293,356 and British Columbia, \$178,885.

The loss denoted in the case of California has been due to the closing of the hydraulic mines, causing a shortage to the extent of several millions that otherwise would not have occurred, as every other branch of gold mining in this State has been steadily increasing for several years past. It should be noted that the bullion made in California consists nearly all of gold and silver, whereas, it is in the case of Idaho, Montana, Colorado, New Mexico, Nevada, Utah and Arizona, largely composed of copper and lead, nearly two-thirds of the Utah and Colorado product being made up of these metals. As a gold producing country California continues to lead by a long way, turning out more of this metal than all these other countries put together, and much more than is produced by any other one country in the world. Of these \$23,607,896 worth of gold taken out in 1885 this State produced \$12,338,014, a sum which it is to be hoped will be increased at the rate of a million or more annually for several years to come. A like increment of silver may also be counted upon here for a considerable length of time.

It is a somewhat noteworthy fact, to which we have before called attention, that each year, California is said by residents of other States or Territories, and even by many of our own citizens, to be no longer a mining region of importance. We are told that our mines are played out, and that our bullion product has fallen off to nothing. Yet every year we keep our regular place in the list of bullion-producing States and Territories. Since the decline of bonanza days on the Comstock, Nevada has given first place to Colorado, and California has held second place, which she holds still. Moreover the other States count in their lead and copper in their totals. Our lead amounts to nothing, and our copper product is small; but we have numerous other mineral products of value which are not recognized in the statistics. We are the only State which produces quicksilver for instance, and were our other mineral products counted, we should make a still better showing. The nearest approach to California is Montana, with over fourteen millions, a large percentage of which is base bullion.

The most curious feature of this position of California is that the yield is effected without any "boom" or excitement of any kind. Capital has gone into other regions in abundance, new works have been put up, new mines opened and developed and new areas worked. Here we are working mainly on old districts and on old mines. It is an encouraging fact that among the most productive and richest of California mines are the oldest and deepest ones. This is a feature of gold mining which augurs well for the prospects of the State for many years to come.

The Bullion Product.

The past year, despite some obstacles and drawbacks, has been a moderately good one with our various mining industries, the total amount of bullion having somewhat exceeded that of the preceding year. As stated in a recent issue, the coast shows aggregate products as follows:

Gold, \$27,290,294; silver, \$46,489,939; copper, \$7,838,036; lead, \$8,562,991; total gross result, \$90,181,260.

In order to draw certain comparisons, we here repeat the statistics of bullion product for 1885, as compiled by John J. Valentine, of Wells, Fargo & Co., the authority on the subject:

STATES AND TERRITORIES.	Gold Dust and Bullion by Express.	Gold Dust and Bullion by other conveyances.	Base Bullion by Express.	Total.
California	\$11,750,490	8 57,624	\$1,000,158	\$15,808,672
Nevada	1,938,858	198,708	1,354,335	3,491,901
Oregon	359,822	107,436	407,426	874,684
Washington	196,000	20,000	4,323,366	4,539,392
Alaska	905,946	200,000	10,000	1,105,946
Idaho	2,001,000	0 317 512	5,811,914	7,819,426
Montana	3,382	3,061 424	13,695,000	16,759,806
Utah	2,959,000	2 024 000	21,372,000	24,355,000
Colorado	236,500	1,107,697	2,494,617	3,838,804
New Mexico	100,000	0 000	6,248,416	6,348,416
Arizona	2,469,823	100,000	2,903,652	5,473,475
Northern (West Coast)	437,704	1 938 310	20,707	2,406,044
British Columbia	120,000	1 938 310	20,707	808,884
	\$23,067,800	\$1,442 842	\$29,399,311	\$53,731 711
				\$90,181,260

The gross yield of 1885, shown above, segregated, is approximately as follows:

	Per cent.	Amount.
Gold	30.26	\$27,290,294
Silver	51.55	46,489,939
Copper	8.61	7,838,036
Lead	9.50	8,562,991
Total		\$90,181,260

Annual Products of Lead, Copper, Silver and Gold in the States and Territories West of the Missouri River, 1870-1885.

YEAR.	Produce as per W. F. & Co. estimates, including amounts from British Columbia and West coast of Mexico.	Produce as per Valentine's annuals, including amounts from British Columbia and west coast of Mexico.	Lead.	Copper.	Silver.	Gold.
1870	\$54,000,000	\$54,000,000	\$25,150,000	\$1,050,000	\$17,300,000	\$38,700,000
1871	62,384,000	62,384,000	25,784,000	1,100,000	19,280,000	40,800,000
1872	62,384,000	62,384,000	25,784,000	1,100,000	19,280,000	40,800,000
1873	72,855,000	72,855,000	27,100,000	1,200,000	20,400,000	43,600,000
1874	74,401,000	74,401,000	27,100,000	1,200,000	20,400,000	43,600,000
1875	80,880,000	80,880,000	27,100,000	1,200,000	20,400,000	43,600,000
1876	80,880,000	80,880,000	27,100,000	1,200,000	20,400,000	43,600,000
1877	85,721,000	85,721,000	27,100,000	1,200,000	20,400,000	43,600,000
1878	75,420,000	75,420,000	27,100,000	1,200,000	20,400,000	43,600,000
1879	75,420,000	75,420,000	27,100,000	1,200,000	20,400,000	43,600,000
1880	84,504,417	84,504,417	27,100,000	1,200,000	20,400,000	43,600,000
1881	84,504,417	84,504,417	27,100,000	1,200,000	20,400,000	43,600,000
1882	92,312,612	92,312,612	27,100,000	1,200,000	20,400,000	43,600,000
1883	92,312,612	92,312,612	27,100,000	1,200,000	20,400,000	43,600,000
1884	92,312,612	92,312,612	27,100,000	1,200,000	20,400,000	43,600,000
1885	92,312,612	92,312,612	27,100,000	1,200,000	20,400,000	43,600,000

The exports of silver during the past year to Japan, China, the Straits, etc., have been as follows: From London, \$36,979,729; from Marseilles, \$1,067,220; from Venice, \$726,000; from San Francisco, \$17,337,000. Total, \$56,109,949, as against \$55,617,578 last year. Pounds sterling estimated at \$4.84.

In presenting the above statement Mr. Valentine observes that the facilities afforded for the transportation of bullion, ores, and base metals, by the extension of railroads into mining districts, increase the difficulty of verifying the reports of the products from several important localities; and the general tendency is to exaggeration when the actual values are not obtainable from authentic sources; but the aggregate result, as above shown, may be relied on as approximately correct.

Mining in California the Past Year

Has, with the exception of hydraulic operations, been actively and successfully prosecuted, the business having been in a healthy condition and the season generally favorable. A light fall of snow the preceding winter on the mountains where the supplying rivers have their sources caused an early shortage of water, the streams commencing to fall more than a month earlier than usual, and failing entirely in many places long before the advent of the winter rains. Not more than once or twice before since mining was carried on in California have the rivers been so low as during the past

autumn. As a consequence, such of the hydraulic miners as are still allowed to prosecute their calling had a short working season, while many of the quartz mills which depend on water for their motive power were compelled to hang up a portion or all of their stamps before the summer was ended. Since the partial suspension of hydraulic washing much of the water formerly used for that purpose has been employed for the propulsion of quartz crushing machinery, the number of stamps now run by water being larger by twenty per cent than it was two or three years ago. What was lost to the hydraulic and quartz miners through this insufficient water supply was made up in part to the river-hed miners, whose success depends mainly on the occurrence of a low stage of water early in the season, and its uninterrupted and long continuance afterwards—conditions that were very fully met the past year. The timely and abundant fall rains having afforded plenty of water, both hydraulic piping and quartz crushing having been resumed some two months ago have since been in active operation, the prospect for a good water supply being at this time favorable.

Exploration and Discovery.

The year under review, without having been marked by any discoveries of special significance or of a startling kind, either here or elsewhere, has, nevertheless, been characterized by a number of mineral finds of considerable importance. Towards the end of 1884 a number of small quartz veins, some of which carried a good grade of surface ore, having been discovered in the New River District, Trinity county, caused quite an emigration to that region early in the following year. So disappointing, however, did the whole business prove that of the two thousand adventurers that visited the district, scarcely a hundred remained by the end of the summer. Those going to work have demonstrated that New River, though far from being what was at first expected, possesses no small degree of merit, several of the veins there on being opened up yielding a high grade ore in moderate quantities. Two small mills and several arrastras have been run on this ore the past summer with profitable results, and there is little doubt but New River will become a lively and popular camp in the course of a year or two.

In the neighborhood of Sierra City, for more than thirty years a prominent mining district, several important quartz finds have occurred of late, some of which have already been developed into largely productive and valuable mines. The same has occurred also in the vicinity of North Columbia Hill, an old hydraulic camp on the San Juan divide, Nevada county. Here, until about 18 months ago, no attention whatever had been paid to quartz, though many auriferous lodes were known to exist in that neighborhood. The closing down of this hydraulic mines throwing many men out of employment, led to a more thorough examination of those deposits, nearly all of free gold in the croppings. One of these lodes, the Delhi, coming into the possession of energetic parties, was equipped with an eight-stamp mill, which, commencing operations in the month of March last, has since been running on \$15 ore, mined and milled at an expense of less than \$3 per ton. Out of the net earnings made the owners of this mine are said to have reimbursed all expenditures, purchase money, cost of mill, extensive tunnelling and other improvements included and realized many thousand dollars in dividends.

A large body of the above class of ore having been opened up in this mine, the owners are about to erect a 20 stamp mill, for which there has already arisen an urgent necessity, considerable quantities of pay ore having accumulated on the dumps of ledges being prospected nearby. According to report there are at least a dozen quartz veins in the district that make fully as good a surface showing as did the Delhi and it seems altogether likely that this section of the San Juan ridges will in the course of another year become a very important quartz mining center. What strengthens this probability is the fact that these veins improve in a very marked manner under exploration, the Alaska, one of the best paying mines in the State, being on the same mineral range with these new locations, which extend northwardly to the grounds of that company. Already all the outcroppings lodes in the district have been taken up and it is expected that with the opening of spring, if not before, the work of development and ore extraction will be extensively engaged in, a good deal being already in progress. In every instance these ledges can be exploited to a vertical depth of 1200 feet by means of tunnels run in upon them from the canyon of the Middle Yuba river which cuts the entire series at right angles. Between the several large ditches that traverse the San Juan divide and the flow of the Middle Yuba, water ample for the propulsion of thousands of stamps can be obtained here at little cost.

The Older Districts.

In a number of the other old and populous districts of California gold bearing veins of greater or less apparent value have been found during the year, awakening additional interest in this branch of mining, and leading to the inauguration of many new enterprises in these several localities. Even in the more remote and thickly inhabited parts of the State the hardy and adventurous prospector has made important discoveries of both gold and silver bearing deposits of late. Along the western foothills and

on both slopes of the Sierra Nevada and out on the Mohave and the Colorado deserts deposits of this kind have been found, some of them evidently of great value; disclosing how little we yet know as to the extent of our metalliferous territory or the possibilities that exist for the almost illimitable expansion of our mining industries. Should exploration continue to reveal from year to year new resources in this direction, California will present a very ample as well as a safe and profitable field for the investment of outside capital. While it is true that the most of these desert localities are badly situated as regards supplies of wood and water, it is likely that the extreme richness of the ores found there will go far towards compensating for these disadvantages. The construction of railroads, several of which already traverse these desert regions, will ultimately afford facilities for taking in lumber, fuel and other supplies, and for shipping out bullion and ores, while artesian boring will in most cases procure all the water required for mining purposes, the trials made to this end having been attended with a good degree of success. That a great wealth of gold and silver will, in the course of time, be developed and prosperous mining communities grow up in these remote and wilderness lands may be regarded as a certainty.

Work Resumed and a Starting Up All Round.

While so much has been accomplished in the way of discovery, the year 1885 has seen a more general reworking of old and partially abandoned mines, and the starting up of more idle mills than any of its predecessors; such procedure having been made possible by the more perfect processes and machinery introduced, and the great advances lately made in every department of the business. Ores that 20, or even 10 or 12 years ago, were rejected as being too low grade to warrant handling, are now being worked with profit; hence, the value that now attaches to deposits formerly considered worthless. While this process of rehabilitation has largely obtained in the older and more central mining camps of California, it has, at the same time, been extended to some of the outlying districts, having reached as far off as Inyo county and other regions beyond the Sierra, where several idle mills and smelters have been started up, and ore extraction resumed on mines that have been neglected for years. For the same reason that work on the poorer class of mines has been resumed there has come to be some sorting over of the old dump piles with a view to picking out such ore as under these later economies and improved methods will pay for reduction. In a number of localities the tailings from the hydraulic and other placer mines are being reworked, in some instances on a large scale, and always with profit. These deposits are very extensive in California, and will yet become a source of large bullion production. With the appreciation of mines of small and formerly of doubtful value, the right to comparatively few claims is now suffered to lapse for want of the legal amount of work being done upon them. The relocating of claims is, therefore, every year growing less and less. Returning now to the subject of

Quartz Mining in California.

It may be remarked that Nevada, Pacer, Sierra, El Dorado, Amador, Calaveras, Tuolumne and Shasta counties continue to be, as they have always been, the sites of greatest activity in this branch of mining. While such is the case, there has still been more than the usual amount of work done in the other mining counties of the State. In no preceding year have so many new quartz mills been put up. While the most of these have been equipped with stamps, quite a large proportion has consisted of the several new styles of crushers, in which stamps are dispensed with. For prospecting purposes and the working of small mines, a good many arrastras are being employed, the tendency in California being toward an increase of these machines, most of which are run by steam or water power, chiefly the latter. Besides the erection of new mills, some of the old ones have had their capacity increased or have undergone such repairs as have added much to their efficiency, the entire ore reduction capacity of the State having been enlarged to the extent, perhaps 10 per cent during the year.

Through the constant introduction of new and improved implements, machinery and processes, and a better acquaintance with the business generally,

The Cost of Mining and Milling Ores in California.

Is undergoing steady reduction, being less now by nearly one-half than it was only a few years ago; as this cost varies widely with varying conditions it is difficult to arrive at a general average, though this does not probably much exceed \$5 per ton. The following examples scattered over the more central mining counties of the State will tend to illustrate this point. The Idaho mine, near Grass Valley, Nevada county, equipped with a 35-stamp mill run by water, crushed during the year 1884, 31,143 tons of ore that yielded \$18.04 per ton; cost of mining and milling, \$7.86 per ton. During the past year the yield of the ore has been somewhat more, while the expense was about the same. The Delhi mine, on the San Juan divide, same county, 8-stamp mill, water power; yield of ore, \$14 per ton; cost of mining and milling, \$2.50 per ton; daily crushing, 20 tons. The Alaska mine on the same quartz range with the Delhi, but two miles to the north of

it, being in Sierra county, outfitted with a 20-stamp mill, which crushes 35 tons per day; yield, \$25 per ton; cost of mining and milling, \$6.75. The Sierra Butte mine, same county, two mills—aggregate 90 stamps—crushed last year 30,000 tons of ore; average yield, sulphurets included, \$6.47 per ton; cost of mining and milling, \$1.30 per ton. The young America mine, situated near the Sierra Butte, 8-stamp mill, driven by water, crushes 15 tons per day; cost of mining and milling, \$4 per ton; yield, \$60 per ton. Plumas-Eureka mine, Plumas county, 60-stamp water mill; ore yields \$7.27 per ton; cost of mining and milling, \$4.32 per ton. Grand Victory mine, near Diamond Springs, El Dorado county, 50-stamp water mill, crushes 225 tons per day, at a cost for mining and milling of 75 cents per ton, the ore yielding about \$2 per ton. This mine is worked after the manner of an open quarry, the vein being of large dimensions and the ore soft and easily crushed. At the Josephine mine, same county, the ore is mined and milled at a cost of only about one dollar per ton, the mill being propelled by water. The ore at the Plymouth mine, Amador county, is mined at a cost of \$3.20 and milled at a cost of 48 cents per ton, the cost of saving and reducing the sulphurets being 21 cents per ton. The company have two mills, the one carrying 80 and the other 40 stamps, both being driven by water. About 80,000 tons of ore are crushed here per year; yield, \$13 per ton. At the Zeile mine, in this county, the 40-stamp mill run by water crushes about 120 tons per day, which is mined and reduced at a cost of \$2 per ton. The ore here is low grade, yielding only \$4.50 per ton; about one-half of this consists of free gold, the balance being in the sulphurets, which are worked on the ground by the chlorination process. The average cost of mining and milling gold-bearing quartz in Amador does not exceed \$4 per ton, treatment of sulphurets included, a good many of the mills here being propelled by water power.

Southern California Mines.

It is only within the past few years that the mines in what is known as Southern California have made any very good showing. The old Julian, Banner and Cuyamaca mines in San Diego county, which created so much excitement in 1870, worked for a few years, and then did little for a long time, are again being worked. But the greatest advance has been in San Bernardino county, which is now a splendid bullion producer. The outlook there is now even better than a year since. The Calico Print says:

The principal mines in Calico, the best silver-producing camp in the State, have been in constant operation during the past year. Four mills in the vicinity of this camp have been in almost constant operation, besides the Waterman mill which crushes about 20 tons a day of Calico ore. The Silver King, Garfield, Occidental, Thunder, Bismark, Gobbler, Silver Odessa, Snow Bird, Waterloo, Sue, Red Jacket, Blackfoot and Mountain Brow, have all been yielding a generous supply of ore, and each mines as the Plutarch, Last Chance, Cuba, Josephine, Sam Houston No. 1 and No. 3, Lyon, Alhambra, Golconda, Kearee, Dora Belle, Humburg, Exchequer, are looking well, but have not been developed on a large scale. The prospects of all these are such as to inspire a reasonable hope that they will yet develop into extensive and rich properties. But little money has been expended on these mines, and those that have not paid dividends, have at least paid expenses, with few exceptions. During the year 1886 the principal mine will be worked on a larger scale than ever, which will necessitate more mills and more men to work in the mines, and result in increased activity and prosperity. The Waterman mine looks as well as ever and keeps about ten stamps in constant operation. The Alvord gold mine is a fine property and turning out daily tons of ore that will yield a handsome profit.

The prospects of the gold mines in Butte Valley are bright, and the gold placer mines near "Old Baldy" Mountain are being worked on a more extensive scale than ever. The gold mines at Kramer are looking better as depth is attained. The gold prospects near Old Woman's Springs are turning out some very rich rock. The silver mines at the Lava Beds are looking up again on account of new and rich strikes. The Soda Lake mines are attracting attention on account of rich developments. The mines of Ivanpah and vicinity are looking well. The Providence mines are as rich as ever, and it is expected that a new mill will be built ere long, a large force of men be employed, and the camp be in a more flourishing condition than ever. The prospects along the Atlantic and Pacific Railroad are beginning to look as though they may develop into valuable mines. In fact, the general mining outlook is very encouraging, and, in fact, we are just entering a year of unprecedented prosperity for the mining districts. The mineral bearing portion of this desert is very extensive, and the present bright outlook is simply a beginning of the brilliant future that awaits the industrious and patient miner and prospector. It is a mining country that is quietly advancing on its own solid merits, and not impelled furiously along by fictitious "booms," like the vessel in the storm, that finally collapses on barren rocks.

In Los Angeles county there is some little placer mining going on north of Newhall and along the old road to Bakersfield, but water is scarce. The same auriferous gravel belt runs

some 15 miles down the east side of the Santa Clara over into Ventura county. A Rhode Island company is now building a seven-mile ditch to bring in water.

The Oil Belt.

In both Los Angeles and Ventura counties there are immense deposits of mineral oil now being developed. The known and prospected fields of Southern California commence at the Pico canyon, six miles west of Newhall, on the S. P. R. R., and follow a course a little north of west into Ventura county, and as far as Santa Paula, a distance of some 40 miles, and to the southeast of Los Angeles, in the Puente hills. A recent strike places beyond a doubt the existence of a valuable oil field in that section of the county. A number of wells are now producing, and the yield of petroleum is annually increasing. There has been a good deal of activity during the year, considerable quantities of the crude oil having been raised and refined, mostly by the single large company operating there. This company has just completed a 63-mile pipe for conveying the crude oil from their principal wells to the seashore, where it will be loaded on vessels and taken to their refinery at Alameda point, opposite the city of San Francisco. The business of gathering and refining these earth oils promises to become one of the paying and permanent industries of the country. In 1884 about 8,000,000 gallons of petroleum were manufactured in this State, the quantity made last year having been much larger.

The Northern Part of the State.

Trinity county has done fairly well in the past year. The bullion shipments from Weaverville alone for 1885, by Wells, Fargo & Co.'s express, were \$191,655. The Trinity Journal says: The mining outlook—and upon the mines depends the business prosperity of the county—is excellent at this time. Already more has been done in the hydraulic mines than was accomplished all of last season, and it now seems certain that the gold yield of 1885-6 will be greater than for any season for many years past. The weather has been most favorable, and work has been done at little comparative expense; accidents incident to a miner's life have been very few and the damage to ditches and other mining property very slight indeed. The opening and development of older quartz mines, the discovery of new ones and the building of mills and working of quartz on an extensive scale has opened up an industry which pays largely and until within the past few years was unknown in this county. While quartz mining here may yet be said to be in its infancy, enough has been done in that direction to demonstrate beyond question its permanence, and give assurance of dividends far beyond the lifetime of the present generation. With the coming of spring the hills will again swarm with prospectors, and we confidently expect to chronicle many rich strikes in quartz during the ensuing year.

There has been considerable attention turned to Shasta county during the past year and there has been a great deal of prospecting done. The Shasta County Democrat says: We have taken the trouble to visit several camps of late, and we are convinced from what we have actually seen that the ultimate mineral development is possible of greater achievements than we have heretofore anticipated. Quartz mining in this county, legitimately, is comparatively in its infancy. The mineral exists and capital, always timid, is yet bound to take hold and invest. The surface prospects alone of one camp—Squaw creek—is simply wonderful, and if honestly described in a newspaper article would be doubted, simply because it would appear incredible. But gradually men of capital will be drawn hither, and they will then see for themselves. It will take money to develop many fine prospects, especially on Squaw creek, but a couple of days' investigation will completely satisfy any mining man that the gold is there to warrant any reasonable expenditure of money in roads and milling machinery necessary to make dividends. No country was ever found more handsomely situated for deep and cheap development, and for wood and water privileges. Bullychoop is improving every day and the new milling facilities that are to be erected there as early in the spring as possible, is certain to give a great impetus to development in that camp. Deadwood and French Gulch are improving rapidly, and new discoveries of value have lately been made in both those districts. Development of a permanent character has just begun, and as regards Squaw creek there is enough ore on the surface to warrant the erection of mills. Altogether the outlook is most propitious, and it is certain that before this time next year remarkable developments will be made and capital will be seeking investment to a much greater extent than heretofore.

In Siskiyou county the quartz river creek bank and high gulch claims give employment to many persons. Quartz mines abound along the southern boundary of the county, adjoining the New River district of Trinity county; also, on Salmon river, further north, and all its tributaries, in which the noted Black Bear and Klamath mines have each a 32-stamp mill. On Scott river—from its junction at the Klamath to the mountains adjoining the Shasta and Trinity boundary—good quartz, placer, bank and hydraulic mines exist; also on McAdame, Indian creek, Cherry creek and Deadwood, north of Scott valley. In the vicinity of Yreka quartz mines exist in the Humboldt range, which

is a continuation of the Salmon range, and continues to Cottonwood and Siskiyou mountains, several good ledges being located at Cottonwood. The Klamath river about 15 or 16 miles north of this place, is also mined nearly its whole length in this county by means of wing-dams, with current wheels to work the derricks, pumps, electric lights, etc., while huge dip-wheels raise water for the sluices. In all these ditches along the southern and western line of the county all other kinds of mining are carried on extensively. Besides the gold mines there are cinnabar, iron, coal and other mines; also quarries of superior marble, stone, onyx, etc.

In Butte county there is considerable work going on. The Oroville Register has an extended review of the situation in the county. At Mountain House Ridge, several mines are being opened and some arrastras are running. The famous Big Bend tunnel has been driven ahead 3560 feet during 1885, making the total distance completed to Dec. 21, 1885, 10,852 feet. They expect to complete the tunnel in April, when they will turn the water into it out of the river and mine the river bed. Some 75 men are at work for the company. The Golden Drift and the Black Channel are two other companies at work. Five or six companies are successfully mining at Kimsbaw, taking out gold. On the Magalia ridge considerable good gravel is being mined. On Middle Butte creek fine pay gravel has been struck by Wiley Bros., Dean and Collins, and considerable gold is being taken out. The Mineral Slide Company expect to spend \$15,000 more before they reach the pay channel. The Cole claim is in rich gravel. On Gravel run, Carr & Co. have gravel some of which runs as high as \$10 to the carload. The mining developments of the county for 1885 are very flattering and more work has been done than during the preceding five years. Next season promises to be the best mining year that Butte has seen for the past quarter of a century.

In Mariposa county the Mariposa grant is out of litigation and may at any time cease to be a drawback to the mining interests of the county. Experts have lately examined the Cooke property, at Conterville, and "the people of that section hope to soon see the mines in operation. The Hite mine is again the property of John Hite, the original owner, and it is hardly probable that it will remain idle for any great length of time. The Cranberry, Red Cloud, Banderita, Vanderbilt, Francis, Diltz, Quartz Mountain, Early, Buena Vista, Stick-in-the-Mud, and a score of other mines, will do their part toward supplying the world with a circulating medium.

Hydraulic Mining.

Of the hydraulic mines which within the past two or three years have been enjoined from running or which shut down through fear of such procedure, several have since resumed operations the owners having so far taken care of their tailings that their action has been considered a reasonable compliance with the requirements of the courts. This has been effected in some cases through the construction of retaining dams and in others by raising the debris by means of hydraulic elevators and returning it to the washing pits or depositing it in other receptacles and there retaining it till the coarser and more objectionable portions have settled, a plan that has been found to answer a very good purpose in the few instances where it was practicable, the trouble with most companies being that they have not enough water to dispose of their tailings in this manner, nor is it possible in all cases to find suitable places for their reception. It takes as much water for feeding one of these elevators as for piping off gravel, and it is not often that so much water can be spared. As a good many companies lack also natural facilities for building impounding dams, it happens that only a small proportion of the entire number enjoined have yet found means to so effectually dispose of these mining slums as to satisfy the anti-debris people or fully meet judicial requirements. And so this vexatious question between the farmers and the miners remains not only unsettled but continues a source of constant irritation and ill-feeling between these two classes, the miners complaining that their opponents persecute them unjustly and the farmers charging that the miners persist in operating their claims in violation of the injunctions issued against them.

In Trinity, Del Norte and Siskiyou counties, occupying the northwestern angle of the State, where hydraulic mining has not been interfered with by the courts, the business has been carried on as usual the past year, the working season having been curtailed somewhat by reason of a short water supply. The seasonable and abundant fall rains having filled the ditches, the hydraulic miners got to work in good time, and having since had favorable weather have to date been doing tolerably well. With a heavy snowfall thus early on the mountain an ample supply of water next spring and summer is assured, which, in California, means a golden harvest for the hydraulic miner.

Drift Operations.

With the closing of so many hydraulic claims increased attention has been given to drift operations, imparting, during the past few years, quite an impetus to this branch of mining in California, where it is now being extensively pursued and, for the most part, with favorable results, the mistakes so common in former years being now generally avoided. The counties most noted for drift diggings are Placer,

Calaveras, El Dorado, Butte, Nevada and Sierra, the most active localities consisting of the Slate Creek basin and the Bald Mountain district, Sierra county; the vicinity of You Bet, in Nevada county, and the Forest Hill divide, in Placer county, in each of which a number of largely productive and profitable claims are being worked. A large proportion of the gravel taken out at the Breece and Wheeler and at the Mayflower mines, on the Forest Hill divide, requires to be crushed with stamps, which is also the case with some of that extracted elsewhere. Where this method of treatment becomes necessary, the expense of handling is much increased, but this class of gravel is always correspondingly rich in gold. Thus, the gravel taken from the Mayflower mine yields on an average \$20 per ton, this being from six to eight times as much as is contained in the ordinary grade. The Breece and Wheeler claim is yielding at the present time nearly as rich material as the Mayflower. The number of men employed by the larger drift companies, varies from one to two hundred. Many claims, however, are worked by small companies, consisting of five or six partners. In several instances this class of operations are being carried on with signal success by companies of practical miners, associated together for the purpose. Formerly many Chinese were employed by the drift companies; but of late they have been almost wholly replaced by white men. Very few Chinamen, in fact, are any longer employed by the white miners in California, though some ten or twelve thousand of them are at work in the California gold fields on their own account. As but little water is required for drift operations, this class of miners were not seriously inconvenienced by the low stage of water the past summer, it being their practice to store their gravel in dump yards, and when they have not water for frequent washings, hold it until the supply becomes more plentiful. The drift mining interest in California is at the present time in a fairly prosperous condition, with a favorable outlook before it. The deposits adapted to be worked by this plan are very extensive, the beds of the "Dead Rivers," in which the most of them rest, covering a linear extent of several hundred miles, of which not a tithe has yet been exhausted.

River Bed Mining

Is still pursued on an extensive scale in California, the Scott, Salmon, Klamath and Feather rivers constituting the sites of the principal operations of this kind now carried on. On the Klamath and Scott rivers the business is pursued on a large scale and in a systematic manner, some of the claims there having been worked for many consecutive years. The low stage of water in the rivers last year and its prolongation well on into the fall, greatly favored this class of miners, the most of whom, as a consequence, gathered from their claims more than the average yield of gold. More than half the river-bed miners in California are Chinamen, with whom this is a favorite style of mining, for the reason that, practiced after this manner, it requires no great outlay of money and is pretty sure to prove fairly remunerative, with the chance of occasionally yielding large returns. In prosecuting this business these people do not, after the manner of the whites, often turn the water of the river entirely from its bed, but merely reclaim a portion of the latter by wing damming, a comparatively inexpensive procedure. River-bed mining, after suffering a marked decline, has for several years past been on the increase in this State, being now carried on to a greater or less extent along every considerable stream that traverses the California gold fields. As a general thing the Chinese lease their claims from the whites or rework portions of the river beds that, having in former years been worked over, have been abandoned by others, this class of deposits having a tendency to slowly reproduce themselves.

Silver Mining.

Not until the discovery of the Comstock lode in 1859, ten years after the gold fields of California began to be actively worked, did the miners of this State begin to prospect for silver bearing ores, or pay any attention to that branch of mining. Although the first discovery of silver lodes in California occurred in Alpine county in 1861, not until 1872 did this metal begin to be turned out in any quantity, the first considerable production made being from the Cerro Gordo mines of Inyo county, which that year turned out about \$750,000, this sum having been gradually increased until 1877, when the amount produced amounted to \$3,000,000. From 1877 the production steadily declined until 1882, when this decline was arrested through the output of the Calico and other mines in San Bernardino county, the silver product of that State having been estimated at \$1,500,000. In 1883 it was advanced by a million and in 1884 by another million, amounting to \$3,500,000. The product for 1885 may be set down at \$4,000,000, a rate of production that can probably be kept up and may possibly be advanced for several years to come. Three-fourths of all the silver taken out in the State comes from the various districts in San Bernardino county, the balance mostly from Inyo county, where the business of mining for this metal has undergone considerable improvement of late. In San Bernardino county it is also represented to be in a generally prosperous condition with encouraging prospects ahead.

Quicksilver Mining.

The following table shows the receipts of

quicksilver at this port from the various mines during 1885, as compared with 1884, showing the total by months:

Months.	1884.	1885.
January	1,901	2,483
February	2,100	2,316
March	3,210	2,262
April	3,464	2,836
May	2,117	2,793
June	1,730	2,713
July	2,611	2,694
August	1,843	3,047
September	1,129	2,978
October	2,506	2,465
November	2,704	2,408
December	1,929	2,827
Totals	27,294	31,865

Showing an increase of 4571 flasks during 1885.

In 1883 the receipts were 47,365 flasks.

The shipments by sea and overland for a series of years were as follows:

Year.	By Sea.	By Rail.	Totals.
1885	15,514	*	*
1884	14,806	7,000	21,806
1883	33,247	4,640	37,887
1882	34,771	5,702	40,473
1881	35,264	10,534	45,798
1880	34,633	11,940	46,573

*Returns incomplete.

The following table shows the production of the principal and all the other mines in the State by months, with the totals, and the highest and lowest price paid per flask during each month of 1885:

MONTHS.	New Almaden Mine	Other Mines in California	Total Flasks	Lowest Price.	Highest Price.
January	1,700	783	2,483	\$34 50	\$33 00
February	1,506	810	2,316	32 50	32 50
March	1,500	762	2,262	31 00	32 50
April	2,003	813	2,816	30 00	31 00
May	2,003	793	2,793	28 50	29 00
June	1,750	963	2,713	29 00	30 00
July	1,750	944	2,694	29 75	30 00
August	2,104	943	3,047	29 50	29 75
September	1,930	1,042	2,978	29 50	30 50
October	1,598	870	2,468	30 00	30 50
November	1,570	892	2,462	29 75	30 00
December	1,977	850	2,827	30 00	32 00
Totals	21,400	10,465	31,865		

Of the total production of 31,865 flasks it will be noted the New Almaden mines produced 21,400 flasks, or about 67 per cent of the whole.

The Guadalupe mine yielded thirty-five flasks, and then entirely ceased operations. The several other small mines operated evidently did not pay for working out what little ore they had to produce 10,465 flasks, which was 1,448 less than their yield in 1884.

The continuance of low price for the metal causes all the quicksilver mines in the State to be worked "for all they are worth," and the present prospects are good for the early exhaustion and closing of nearly all the mines now producing. No new discoveries of quicksilver-yielding ores have been made for the last five years, and the probabilities are that the bodies at present worked are all the deposits of ore in paying quantities that exist in the United States. When they are worked out and the silver and gold mines of the United States are compelled to buy quicksilver (without which their ores cannot be worked) from the Governments of Spain and Austria, who will then own the only source and supply of quicksilver, it is likely that the silver question will assume an entirely new phase, for the few owners of quicksilver will have the power to control and limit the production of any and all the gold and silver-producing mines of the entire world. To put quicksilver at a price of \$1 a pound would soon shut up many silver mines yielding low grade ores, and it is possible that the control of quicksilver could be so managed as to prescribe to what mines should be permitted to purchase the quantity needed for working their ores.

The exports this year amounted to 15,514 flasks, valued at \$478,827, 618 flasks in excess of last. Australia did not take any from us during 1885. There were 100 flasks exported to that country in 1884. The greatest gain to any one country during 1885 was to New York, the exports being 9,055 flasks, as against 8,350 in 1884, an increase of 705 flasks.

Coal and Iron.

Coal has been rather depressed during the past year. The amounts imported in 1884 and in 1885, are strikingly similar. J. W. Harrison's circular gives the following figures as showing the various sources whence we received our supplies:

Collieries.	Tons.
British Columbia (Wellington and Nanaimo)	224,228
Australia	200,751
English and Welsh	170,656
Scottish	20,228
Eastern (Cumberland and Anthracite)	29,534
Seattle	75,112
Carbon Hill	157,245
Green River, Cedar River, Mount Diablo	71,611
Renton, Newport, South Prairie	67,004
Totals	1,023,330

The arrivals at Wilmington are computed in the above figures.

It is to be hoped that this year may prove remunerative to investors in our coast collieries. The experience of the past year should be beneficial to our local managers; low prices increase consumption but little, and certainly present quotations can leave but small profits on the large amount invested.

The importations of foreign coke this year

have been 20,611 tons, as against 10,695 in 1884. The major portion of this is shipped inland for smelting ores—as English and Scotch coals are especially adapted for this purpose.

As to iron, it was generally supposed about a year since that the Clipper Gap, Oregon and Puget Sound furnaces would produce more than sufficient for the requirements of the coast; they have the capacity and material, but cannot market their products profitably, when American at \$21.50 and Scotch at \$22.50 per ton are the competitors.

The figures show our stock on hand to be 3375 tons less than last year at this time, yet 935 tons greater than the average stock for the past five years at this time. The stock on hand and en route, together with the promised return of the Clipper Gap furnaces for the next six months, insures consumers against any scarcity in the near future.

The present stock on hand consists of 13,459 tons, of which 8150 tons are British, and 5339 tons are Eastern and home manufacture. There are 3943 tons in the firsthands, and 9546 tons among consumers.

Foundrymen are hopeful of a material improvement this year over the last, as several extensive improvements are being figured on, which will consume considerable iron, and it is anticipated a number of quartz mills will be erected in the spring, which will aid materially in enlivening this branch of trade.

Other Mineral Products.

There are many other mineral products of California which are profitably worked. We produced last year about 5,000,000 pounds of borax, 30,000 tons of salt, some little lead, probably 1000 tons of copper, etc. The chrome iron industry is a profitable one. Among our other mineral products are antimony, asbestos, asphaltum, bismuth, building stone, cement, clays, coal, graphite, gypsum, manganese, mica and sulphur. Some of these are utilized, while with others very little has been done.

Dividends.

It is a mistaken idea to take the published list of dividends of mines for the total mining profits. Only those mines are put on the list as published, which are incorporated or are "called" on the stock board. But there are hundreds of others which are paying properties, which never come before the public. The following statement by the *Bulletin* shows dividends paid (mostly in San Francisco) by mining companies in 1885.

Dividends	Amount.
Bodie Consolidated	1 \$33,466
Derbec Blue Gravel	3 30,000
Father De Smet	12 240,000
Caledonia (Dakota)	2 20,000
Honestake	13 525,000
Idaho	12 200,000
Jackson	3 15,000
Ontario	12 900,000
Plymouth Consolidated	12 575,000
Plumas Eureka	2 105,408
Silver King	8 200,000
Synthetic	2 20,000
Sierra Butte	2 30,000
Bird's Eye Creek	2 15,000
Mt. Diablo	3 30,000
Navajo	2 50,000
Richmond Consolidated	1 62,500
Totals	93 \$3,069,550

This is a list of only 17 companies. None of the producing mines of San Bernardino county are included, none of the paying Sierra county drift or Shasta quartz mines, and only one Nevada county and one Amador county mine. The mines owned by private companies, or by individuals do not publish their dividends, so that the list is misleading. In 1884 there were 23 companies on the list corresponding to the above, the aggregate dividends of which were \$3,555,738.

Gold and Silver Coinage.

The coinage of the U. S. Mints for 1885 was as follows:

Double Eagles	\$13,875,560
Eagles	4,815,270
Half Eagles	9,065,000
Three Dollars	2,730
Quarter Eagles	2,217
Dollars	12,205
Standard Dollars	23,669,767
Half Dollars	3,065
Quarter Dollars	3,632
Dimes	257,712
Five Cents	73,825
Three Cents	143
Cents	117,655
Total	\$56,863,811

The coinage for the last month of 1885 was quite large, amounting to \$7,253,111, of which \$4,699,364 was in gold, mostly in eagles and half eagles, \$2,549,611 in silver, mostly in dollars, and \$9136 in bronze, mostly in cents.

The coinage for the past year may be classified as follows:

Gold	\$27,773,012
Silver	23,934,176
Minor	191,623
Total	\$56,808,811

The coinage of base metal pieces last year was the smallest in many years. More than double the amount of eagles was coined last year as compared with 1884, while the coinage of half eagles was more than four times larger. The half eagle is a popular coin in the East, but California bankers prefer the double eagle, because more easily and safely handled.

PEOPLE living up in Modoc and other mountain regions have a difficult time now communicating with the outside world on account of the rough roads.

ARIZONA

Arizona during the past year has not made as much progress as was expected of her.

There have been many discoveries made, and a good deal of prospecting has been carried on, but the older and better developed mines have not been able to turn out as much bullion as was hoped. The Tombstone mines have been troubled with water; and the low price of copper has retarded the growth of the copper mining industry. Quijota district has been producing but three months, the Vekol six months, while several producing mines in Pinal, Gila and Yavapai counties in 1884 have been idle during last year, and the Verde and others of Yavapai county have not been operating during the year. Pima county has made the greatest advance in mining during the year, especially so in the business of ore shipment, Harshaw and Pima districts being the principal chloriding camps.

The Tucson *Star* has collected as far as possible, the statistics of production and put them in concise form. That journal says:

The bullion statistics given below are all, save one, official, and although strenuous efforts were made to secure full returns, several producing mines have not been reported. The total silver bullion produced, so far as heard from, including concentrates and ore shipments, amounts to \$4,502,875.47, and gold bullion, \$282,614.03, making a total of \$4,785,390.50, being nearly \$2,000,000 more than was officially stated for 1884. To this can be added for 1885 at least, \$1,500,000 not reported.

The following tabulated statement, officially reported, will give some idea of the importance of the silver and gold products for the past year:

GOLD BULLION.	
Grand Central	\$ 45,342 03
T. M. & M. Co.	2,3 00
Dos Cabezas	34,000 00
Yuma county	22,100 00
Shipped through Tucson Express office	118,872 00
Arizons Central (estimated)	60,000 00
Total	\$ 232,614 03

SILVER BULLION.	
Grand Central	502,735 60
T. M. & M. Co.	429,744 00
Contention Con.	207,173 87
Peerless Mining Co.	108,964 00
Jessie Benton	62,568 60
Silver King	815,370 00
Vekol	240,000 00
Chp.	176,180 00
Concentrates from Maricopa	22,750 00
Concentrates from Benson	12,600 00
Total	\$2,671,285 47

Chloriding.

One of the most important features of the mining industry during the year has been the development of chloriding, which is fast becoming a permanent and profitable industry. The *Star* has received reliable returns from the points of shipment, which show that Northern Arizona has shipped out of the Territory 3279 tons per the A. & P. R. R., and Southern Arizona has shipped per the S. P. R. R., 8931 tons. The total shipment being 12,210 tons, tabulated as follows:

From	Tons.
Crittendon	1,353 1
Tucson	3,222
Maricopa	3,734
Casa Grande	126 1
Wilcox	122
San Simon	47 1
Pantano	26 1
Picacho	10
Yuma	10
Mohave county	3,279
Total	12,210

The average value of the ore shipped is over \$150 per ton, which gives an ore shipment of the sum of \$1,831,500, which shows the importance of the mining industry.

SUMMARY.

Total gold product	\$ 282,614 03
Total silver product	2,671,285 47
Total value ore shipped	1,831,500 00
Grand total	\$4,785,390 50

The copper product of the Territory shows up well, considering the fact that several producing companies during 1884 were compelled to close down on account of the low price of copper and the high price of fuel. The product for 1884 was estimated at 27,000,000 pounds. The actual product for last year, as far as heard from, was as follows:

COPPER BULLION.	
From—	Pounds.
Bisbee	7,961,923
Clifton	10,680,500
Globe	4,904,420
Picacho	37,000
Casa Grande	37,000
Total	23,360,508
Market value, 11c per pound	\$2,569,655 88

LEAD.	
T. M. and M. Co., lbs.	1,456,009
Benson smelter, lbs.	3,413,360
Total	4,869,369
Value, \$60 per ton	\$146,040

RECAPITULATION.	
Gold and silver	\$4,735,333 50
Copper, value	2,569,655 88
Lead, value	146,040 00
Total value of all metals	\$7,501,029 38

COLORADO.

Colorado stills holds first place as a bullion producer, the great output of the camp at Leadville making such an addition to the general product as to admit of this. The recent discoveries at Leadville, to which we have before referred in the PRESS, show that this bullion product is not likely to fall off for some time to come. This gold belt of the State are said to be of large extent, and both lode and placer claims show evidence of richness. These deposits seem to lie on either side of the continental divide, and in the spurs and basins along its course. Beginning in Rio Grande county, they follow this Pacific slope through Gunnison, Pitkin, Eagle, and Summit counties, whith to the east, in Boulder, Gilpin, Clear Creek, Park and Lake, even into Chaffee county, small veins present themselves. Indeed, there is not a county in the State in which mineral deposits have been found where gold does not exist; but as the deposits of silver and lead have been so much larger and more accessible, mining has been principally confined to the latter metals and less attention has been given to a thorough exploration of the gold field.

In fact, just now Colorado is flattering herself that, having outstripped the other States and Territories in producing silver and lead, she will in a few years beat California in gold yield. This is hardly probable, however, for our California gold fields are well developed now, and our mines well equipped. Moreover, there is now more attention being paid to gold quartz mining than ever, and our drift mines are pausing out very well. In Clear Creek county Colorado, more gold is produced than ever before. The product of the Freeland mine was \$4 per cent gold—\$280,602.04; the H and W also produced considerable, these two mines turning out \$252,184—more than the entire product of some of the gold producing counties. The Elk Mountain Pilot gives the following mineral shipments from Crested Butte for the year ending, Dec. 31, 1885:

Where From.	No. of Tons.	Estimate Value.
Aspen.....	1,250	\$125,000
Forest Queen.....	460	60,000
Augusta.....	470	47,000
Bullion King.....	52	15,488
Ruby Chief.....	40	8,000
Excelsior.....	60	12,000
Miscellaneous lots.....	240	24,000
Total Shipments.....	2,572	\$300,480

Anthracite and bituminous coal are both mined there, and a great deal of coke is made. They shipped last year 46,690 tons of bituminous coal, 29,080 tons of anthracite, and 22,240 tons of coke. Total coal shipments, 98,010 tons.

In Gunnison county, the camps are spread over a large area. An estimate of the number of mines now worked in Gunnison county, counting only those that have shipped ore this year, and omitting the hundreds of prospects, many of them excellent, would be by districts as follows, according to a correspondent of the Denver Tribune-Republican: Irwin four, Crested Butte six, Gothic seven, Crystal five, Scofield three, Elko three, Tin Cup seven, Spring Creek two, Pitkin two, Tomichi five, White Pine six; total, fifty. Of these fifty mines about ten have yielded a greater output than all the others combined. They are the Sylvanite of Gothic, the Forest Queen and Bullion King of Irwin, the Augusta of Crested Butte, the Doctor on Spring Creek, Enreka and Lost Contact at White Pine, the Legal Tender at Tomichi, the Jimmy Mack and Gold Cup at Tin Cup.

There has been more actual mining and less speculating in the camps of the county during 1885, than any previous year in the history of the county. The completion of the smelter gives new life to the mining industry since many low grade mines can now work at a profit that could not pay freight over the Continental divide. Next season these prospects will become paying mines.

Concerning Dolores county, we quote from the same authority: The Grand View Smelting Company, the Pasadena Smelting Company, the Rico Reduction Company (lixivation and amalgamation) and the Santa Clara Amalgamation Works comprise the reduction works of Rico. The Grand View Company's works have been in operation a little over three months. They have reduced about \$160,000 of ore, and have over 600 tons in reserve, worth \$160,000 to \$175,000. Its average daily reduction is 25 tons, while the present daily shipments average 30 tons. The smelting plant cost about \$100,000. The Pasadena Company's works have been in operation fully two-thirds of the year. In round figures it has shipped bullion valued \$500,000. These works are now closed until the spring. The plant is worth \$75,000. The works of the Rico Reduction Company, which cost over \$100,000, made a run of two or three weeks and then closed down for the year. Five thousand dollars worth of bullion was the result. The Santa Clara has been idle during the year; plant worth, \$15,000.

During the past year many important developments have been made regarding the mineral resources of Pitkin county. The Aspen Times claims a production of \$4,500,000 for the county during the year.

The Register-Call gave the following as the output of Gilpin county for 1885:

Smelting ore, 12,940 tons.....	\$ 970,500
Bailing, 15,550 tons.....	388,750
Tank shipments of gold.....	914,925
Individual shipments.....	50,000
Miscellaneous.....	50,000
Total.....	\$2,374,175

The Idaho Springs Gazette claims a product of over \$3,000,000 for Clear Creek county alone. Many estimates of the production of camps and mines have been made, but many of them are exaggerated. As the Denver Tribune-Republican properly says: "Owners and shippers, in giving newspaper men information, are as apt to inflate values as the miner is to choose his richest rock for assay or mill sample. A mine's output, as gathered from owners, must be put through a severe shrinking process before it will tally with the records obtained from smelters. If we should accept the returns from individual districts and add them together the total would far surpass the bullion yield by all the smelting plants of the State. There is no denying the fact that very many counties have made rapid progress in mining work and gained largely in yield considering the shortness of the shipping season of 1885, but the receipts at the smelters do not substantiate the claims made as to the amount of increase. The mines of the State are, of course, better developed than ever, and the exposures of mineral are beyond that of any previous period."

The Idaho Springs Gazette claims for the district around that region a product of \$489,408.30 gold and \$354,019.30 in silver, lead and copper, a total of \$843,427.80.

The Mathews & Webb Sampling Works, which have been erected the last year, at a cost of \$10,000, purchased the following amount of ore:

Silver.....	\$250,620 00
Gold.....	170,238 00
Lead.....	20,119 11
Copper.....	2,546 88
Total.....	\$401,430 49

We have a number of mines in the district which are producing from \$1000 to \$5000 monthly. The outlook for 1886 promises to largely increase these figures. This shows what legitimate mining can do. Less than 400 men are employed in making this grand production. The output in gold shows conclusively that we have as much a gold district as we have silver. This year's output of gold will be largely in excess of last year.

The Georgetown Courier declines to make estimates of Clear Creek's output, but gives only such statistics as are obtainable. At the public ore market Messrs. Duncan & Wheeler purchased ore of an assay value of \$405,395. The weight of ore purchased by G. W. Hall & Co., containing silver, lead and gold, from Jan. 1, 1885, to Jan. 1, 1886, was 5,567,534 pounds, containing 605,404 ounces of silver. The assay value of the three above metals combined is \$648,201.22, taking the average price of silver for the basis to figure upon as \$1.05½ for the year.

The Miners' Sampling Works purchased ore to the amount of \$186,086 during the year. During the year there were 8,528 tons of ore shipped from the Georgetown depot, the mineral being valued at about \$1,200,000.

The Boston and Colorado Smelting Company made the following purchases during the year 1885:

Locality.	Gold.	Silver.	Copper.	Totals.
Gilpin.....	\$ 374,000	100,200	\$ 52,600	\$ 526,800
Clear Creek.....	154,600	450,000	38,400	643,000
Boulder.....	92,000	39,000	131,000
Lake.....	75,000	75,000	150,000
Summit.....	270,000	270,000	540,000
Park.....	9,900	57,200	900	67,000
Gunnison.....	30,000	39,000	69,000
Custer.....	2,000	4,000	6,000
Hinsdale.....	1,300	4,000	3,700	9,000
Saguache.....	8,000	8,000	16,000
Ouray.....	400	1,500	800	2,700
La Plata.....	14,500	8,000	18,000	40,500
Rio Grande.....	1,900	600	2,500	5,000
California.....	4,000	14,000	1,000	19,000
Nevada.....	85,000	120,000	1,000	206,000
New Mexico.....	30,000	40,000	9,000	79,000
Arizona.....	19,000	8,000	27,000	54,000
Utah.....	5,500	37,000	11,500	54,000
Idaho.....	11,800	1,200	13,000	26,000
Montana.....	01,000	500,000	240,000	741,000
Mexico.....	2,000	22,000	4,000	28,000
Miscellaneous.....	327,000	029,000	26,400	402,400
Total.....	\$1,104,700	\$2,506,000	\$402,000	\$4,012,700

The last item includes purchases from smelters, sampling works and ore buyers. It is impossible to tell where it comes from.

The Ouray Times give a summary of the output of Ouray county by districts: Red Mountain, \$1,843,000; Mt. Sneffels, \$280,000; Poughkeepsie, \$305,000; Paquin, \$75,000; Total, \$2,503,000.

In San Juan county there has been a marked increase of product, though dull times are complained of, and capital, which was expected, has not come. The tribute or lease system of mining has benefited them, however, as the La Plata Miner says: "We venture to say that the leasing of mines in this county during the past year has done more to develop our resources and swell our ore product than all of the Eastern capital that could find room in our mountains. The lessee is deserving of more than passing attention, for it is to his indomitable pluck and confidence in certain properties that has brought them from unproductive prospects to regular producing mines."

The same paper says: In making up the table for the output we have thought best to omit the names of the mines, for the reason that many of the mine owners are averse to giving it for publication, and the ore buyers and samplers do not like to give names and amounts. So by giving totals handled by each firm all or nearly all is included, and the private business of none interfered with. Nearly one-half of the county product was bought and treated by the N. Y. & San Juan smelter of Durango. These works, although located outside of the county, are almost looked upon by San Juaners as a county institution, the business relations be-

tween it and our miners being so close, and is, perhaps, somewhat exaggerated on account of the friendly relations which have grown up between them on account of the fair dealings of this concern. The general manager, Mr. J. A. Porter, expects to be able to handle double the amount next season which he has handled this.

STOKER SAMPLING WORKS.	
Sampled.....	Tons.
Shipped without sampling.....	5,773.72
Shipped with sampling.....	74.75

Leaving product of county.....	\$1,207,438 19

Southwestern Colorado has made rapid advances towards a just recognition among mining men and investors, during the past two years. The hullion from a few furnaces and stamp-mills, together with thousands of tons of valuable cruds ore shipped out, has dispelled all doubts regarding the real merit of the great lode veins of the San Juan country. Capitalists will still find abundant opportunities for favorable investments there, in that class of properties, and also in that most fascinating of all ventures—placer mining. If the newspapers of that part of the State are talking truthfully, there must be immense tracts of very rich gravel deposits awaiting the assistance of capital and experience to yield enormously.

It would be, of course, impossible in the space we have to spare to give a very extended review of so large a mining region as Colorado. Capital has taken hold of mines there in every direction and there is more probability of the annual output being increased than of its lessening for some time to come.

IDAHO.

Idaho Territory mines are now making a good record. The newer camps, have by their production in the past few years, attracted many miners to the Territory, and the result has been a good deal of prospecting, and many discoveries. The Wood River region, opened five or six years since, is one of the prominent camps of Idaho, and is quite an extensive one. It was rather dull the first part of last year, but recently many new discoveries and strikes have been made. Everywhere along the gulches trending toward the river valley, prospects here almost unheard of, or abandoned, have developed into large producing and paying mines; the prospector has renewed his location infused with strong faith in the final outcome of his efforts; new mills and smelters have been put in place, or bargained for by prospering mine-owners and a promise of financial success seems to pervade mining generally throughout the entire galena belt lying within the Wood River region.

The Wood River Times says that it "has been pretty fairly demonstrated, through this section of country, that deep mining pays. The ore bodies do not always increase in richness as depth is attained, but they almost invariably widen out and possess a uniformity of value per ton, which makes a mathematical calculation as to their paying qualities so nearly certain that the capitalists cannot fail to see that investment here, in ore in place, is almost as sure as any of the commodities of commerce which are already in market. We cannot but feel that a new era is dawning for Wood River, not that we anticipate a boom and a rush, but rather that the legitimate growth, in all our varied interests, will increase in a more rapid ratio than ever before."

From Ketchum, one of the towns of the region, the Philadelphia smelters shipped, in 11 months of last year, 1780 tons of bullion; Clayton and Bayhorse, 573 tons; Ketchum ore, 352 tons; Clayton ore, 121 tons.

In the past year the number of producing properties is said to have doubled, and there is a large number of mines not up so far to a producing basis. The greatest producing mine of Wood River is the Queen of the Hills. It is completely outfitted, and has the best ore concentrator in the country. The pay ore is said to average six feet in width. The ore product is one-fifth first-class, and is run through breakers and shipped. The other four-fifths is good concentrating ore, and on being run through the mill is reduced about six tons into one of concentrates. The concentrator, as now constructed, has four pair of rolls, ten three-compartment jigs, a Westinghouse engine, and a Pulsometer pump, lifting water for mill use out of a well. Its capacity is 100 tons a day. The

Salt Lake Tribune gives some interesting facts about this and other mines about Wood River. From October 1, 1884, to December 1, 1885, a period of 14 months, we have the following grand results of the operation of this mine and mill: total ores and concentrates shipped sold, 7,273,009 pounds, aggregating 3636½ tons. The gross value of these ores aggregated \$464,078.98. Out of this amount the company paid transportation and freight charges, aggregating \$134,540.63. This left them net receipts of \$329,538.35. The cost of \$37 per ton in freight and smelting charges took almost one-third the value of the ore. We have spoken of the large net receipts after paying such heavy freight and smelting charges. Out of those receipts came the funds to place \$70,000 in machinery; to develop the mine by cuttings aggregating over one mile in length, for which miners and other workmen were paid; powder, fuse and other supplies purchased, besides paying about \$20,000 in the purchase of adjoining claims and lots, and meeting seven dividends of \$12,500 each, aggregating in dividends \$87,500.

Mine timber costs five cents per running foot; coal, \$10 by the carload; men, \$3.50 a day, 10-hour shifts. This cost of concentrating is about one dollar a ton, and they get nearly all the value in this material.

First-class ore runs from \$5 to 98 ounces silver, and 70 to 75 per cent lead in shipping lots. Concentrates go 70 to 87 ounces silver, and 60 to 75 per cent lead. Fifty men are employed in the mine and twenty-five in the mill.

The Minnie Moore is another great property formerly a large producer. In 1885, it produced \$90,000; the Humburg produced \$40,000; this Idahoan has paid \$80,000 in dividends in 1885.

The operations of the Philadelphia Smelting Co. at Ketchum have been successful. Two thirty-ton stacks were kept running since last June, the output of bullion aggregating 2500 tons, assaying 200 ounces silver and a few dollars in gold, bringing the value of bullion up to \$750,000. These works give direct employment to 75 men besides 15 coal burners under contract, and a large number of teams and men hauling supplies and ore. Besides this work of the smelters, this company operate four mines, two of which are under lease. In the two mines and the concentrator connected with them, employment is given to 45 men. Their concentrator has a capacity of 40 tons daily, reducing six tons to one, and is located near the North Star mine on the east fork of Wood river.

At Galena, there is a small smelter, but there is not very much going on there. Little Wood River is another district, not very much developed as yet, but in which there are many locations. The Little Smokys is another mining region now coming to the front. The Sawtooth county, it is hoped, will do better in 1886 than last year.

During last season shipments of ore were made to the Ketchum smelter from the Chloride, Summit No. 1 and No. 2, Cambria, Mammoth, Pilgrim, Silver King, Real Estate, Ruth, Sunbeam and Atlanta mines. The Last Chance sent ore to the Galena smelter. During the winter the following mines are being worked: Silver King, by Henry Tevis and associates, of Philadelphia; Bidwell & Beaver and Columbia, by the Sawtooth Milling and Mining Company.

At Vienna, the Vienna Company have a 20-stamp dry crushing mill, but it does not run continuously, because they do not get ore enough.

In the great Yankee Fork county, is the 20-stamp mill and complete plant of the General Custer mine, which has produced in all \$3,500,000. The mill is now working 30 tons of \$40 rock per day. The famous Charles Dickens mine is not now productive, being in litigation.

At Bayhorse the smelters have been closed of late, but work is going on in the mines. At Lost River are large veins of copper ore. Lava district has a few rich mines, and many prospects. In the famous old Boise basin the mining interests are by no means extinct. For several years they have been changing from placer to quartz mining, and while fewer men are employed the output of gold and silver for several years past has been quite uniform, and probably for the past year may be put down at low figures—at \$2,000,000, something less than half of which is gold. Some, in a position to warrant a judgment, place the production higher. The quartz interests of the region are coming to the front.

The old Silver City mines are being worked in a few instances, and better times are hoped for, and it is predicted that the coming season the bullion shipment will be more frequent.

The Cœur d'Alene mining district which many were ready to abandon last year, and which some in fact did abandon, is turning out to be all that was hoped for even during the period of high expectation which led to the celebrated stampede. It has been demonstrated by the test of actual gold production that the district is a rich one. The camp or district has now a population of about 2500 and the Oregonian says the output of gold dust for the past year has been about \$400,000, or above \$1000 per day. A circle fifty miles in diameter drawn around the town of Murray as a central point, would take in all the mines which go under the general name of "The Cœur d'Alenes," and all the country included in the Cœur d'Alene district. Discoveries of both gold and silver have been made all over the district, but the main gold finds are along the Cœur d'Alene river and its tributaries, or about the middle of the imagined circle. The main silver discoveries are in the south and southeastern parts of

the district. The trend of the gold ledges is northwest and southeast, and the trend of the silver ledges is northeast and southwest. The placers of course are along the streams.

The greater number of the 2500 men now in the camp are independent miners who work the shallower places in pairs or squads as partners. Each "firm" of two or more owns its mine and operates it by the small and laborious methods which alone poor men can employ. The diggings are not of a sort favorable for this kind of mining and it is only because they are very rich that profit is found in working them in this way. The shallowest ground in the district would be called deep anywhere else. In very few places is bed-rock reached short of 12 feet and in many places it lies even deeper under a coating of worthless soil and gravel. But the mineral is there and in spite of its deep hiding and the difficulties of reaching it, it is being brought out in very considerable quantities.

Capital, as usual after long delay, has found its way into the district and is preparing to revolutionize methods and to take out thousands where now only tens of dollars are mined. Many small ditches have been built and an immense flume to cost above a quarter of a million dollars is in course of construction. There is a 10-stamp mill in operation at the Golden Chest quartz ledge. Twenty-five tons of ore is reduced daily. How much it yields is not made public; but it is quite well known that the mill is making "a big thing" for its owners.

The Galena fields are not less extensive than the gold fields. They lie to the south and southeast, and have been prospected thoroughly. In one instance a drift has been run into the mountain side a distance of 350 feet. Practical men and experts are convinced that the ledges are rich and permanent, and recently several of the mines have been sold to capitalists who will put in smelters in the early spring. Also two more mills for the gold ledges have been contracted for.

MONTANA.

Montana has of late made as rapid advances as any of the hulsion-producing regions, mainly owing to the magnificent ore production of the camp of Butte, now the liveliest mining camp in the United States. After the working out of the marvelously rich placer deposits in Montana, many years ago, the mining industry of the Territory languished for a long time. Then came the new discoveries at Butte and elsewhere, and the building of railroads. Since then Montana mining interests have been more important than ever. Some of the finest reduction works in America have been put up, and the output of hulsion is such as to have brought Montana to the third place in point of production, taking the next rank below California, and leading Nevada.

Of course each year very wild estimates are made of production, some of them exceeding by two or three times the actual returns. Yet Montana should be proud of her record as it stands. Moreover, it is probable that her hulsion yield will be increased for some years, as her mines are well opened. There are abundant facilities for reduction of ores and for transportation. There are plenty of mines and miners, and capital has been brought in where needed. The letters of our special correspondent, Mr. Huston, who has been traveling through the Territory of late, have given many details of the mining situation in the Territory, so it is not necessary to go into any very extended review at this time. Not only are mining affairs there in good condition now, but they are also improving in every direction. The only drawback of late has been the very low price of copper, which has, of course, been disadvantageous to the extensive copper mines, which are second only to the famous ones of Lake Superior.

The most important camp is Butte. It is estimated that the average ore output of the district reaches 60,000 tons per month, one-fourth of which is produced by the Anaconda mine and shipped to the great works at Anaconda. A portion of the rest is reduced in the mills and smelters here and the balance shipped to points east and to Europe. The Butte *Inter-Mountain* annual gives the names of the stamp mills, with the number of stamps.

	Stamps.
Alied	80
Lexington	60
Moulton	40
Silver Bow	30
Centennial, rollers, capacity	20
Dexter	15
Old Lexington	10
Clippert	10
Total	265

Although these mills are run at their full capacity and treat over 300 tons of ore each day they are inadequate to meet the demands of the ore producers, and many mines are unworked by reason of a lack of proper facilities for reducing their output.

Smelters.

The following list includes the smelting and matting furnaces:

Smelters	Capacity in tons.
Colorado	300
Montana	300
Clark's Columbia	100
Bell	100
Parrot	200
Liquidator Concentrator	100
Butte Smelting Co.	250

The cost of concentrating copper ores at the works here is about \$1 per ton; cost of roasting, \$3 to \$3.50 per ton; cost of matting, about \$7 per ton.

Free milling silver ores are worked at custom mills for from \$10 to \$15 per ton. The great cost of salt laid down at the mills is a serious obstacle to the development of mining properties. The several mills use \$33 tons per month or about 10,000 tons per year. The railroad freight charges—\$20 per ton for a 400 mile haul—amounts to \$200,000. The first cost of the article, together with its transportation to the mills, amounts to \$6 per ton or \$60,000 per year, making an aggregate of \$260,000 per year paid by millmen for the single item of salt. Steps are being taken by the millmen of the district looking to a reduction of freight charges on the article.

Butte's output of precious metals for the year 1884 was a trifle over \$8,900,000.

For 1885 the *Inter-Mountain* makes an estimate of the output of the camp, which is about a million in excess of the figures given by Wells, Fargo & Co. for the whole territory. The *Inter-Mountain* says: "For the year 1885 the product of the camp reached \$15,350,800, an increase of \$6,408,800. The estimate is based upon actual shipments of copper ores, matte and tailings, silver ores and bullion from Butte. The table of shipments shows the following:

	Tons	Value
Copper ore	215,111	\$6,608,800
Matte and tailings	12,455	2,000,000
To which must be added 365,000 lbs. silver bullion shipped by Pacific Express Co.	523	750,000
Grand Total		\$15,350,800

"The Anaconda mine contributed \$3,560,000 to this output. The credit is given in the 218,111 tons of copper ore shipments, the larger portion of which was sent to the smelting works at Anaconda for reduction. The present outlook of the mines warrants the assertion that the output of silver and copper for Butte for the year 1886 will reach \$25,000,000."

The tables compiled by the freight agent of the Union Pacific Railway from January to December, 1885, gives the shipments of copper ore for 1885 as 218,111, an average of 158,131 tons over previous year; matte and tailings, 12,455, an increase of 485 tons; silver ore, 523 tons. The camp imported 9972 tons of salt last year.

The famous Anaconda copper mine was bought not long ago by J. B. Haggin, of San Francisco, for \$30,000, and about \$600,000 have been spent upon it and its machinery, etc. The total output of the mine for 1885 was about 180,000 tons, valued at \$3,560,000.

Those interested in mining in Beaverhead county have every cause to feel proud of the brilliant results which have attended their labors during the year of 1885. Seehree, Ferris & White have handled about all of the bullion and ore shipped from the county, and they report to the Butte *Miner* the following as the result of the past year:

	Pounds.	Value.
Base bullion	200,000	\$ 51,000
Ore	1,355,000	145,000
Gold dust and bullion		105,000
Total		\$201,000

This is about double that of the previous year, and is only a small item compared with what seems to be in store for them in the near future. The most important developments during the year have been made in the Bald Mountain districts, in the Polaris and Lost Cloud veins.

Of Meagher county the estimated total output of precious metals and iron, copper, lead and coal for 1885 is \$248,000.

The *Miner* also estimates the output of Jefferson county at \$15,000,000 for 1885.

The estimated amount of metal received at the U. S. Assay Office at Helena for 1885 is as follows:

	Gold.	Silver.
First quarter	\$100,900.70	\$26,549.65
Second quarter	280,679.50	20,099.02
Third quarter	401,056.91	4,230.65
Fourth quarter	327,990.71	4,268.72
Grand total for both metals	\$1,110,627.82	

The Granite Mountain mine, Phillipsburg district, Deer Lodge county, is a very rich one. From Dec. 2, 1884, to Dec. 1, 1885, the mill was in operation 326 days and treated 6963 tons of ore, from which 1,001,588 ounces fine silver were recovered, and the proceeds of sales of which aggregated \$1,037,500. Total output to Dec. 2, 1885, \$1,311,500. Since Dec. 23, 1884, regular weekly shipments of fine silver bars have been made. The company commenced paying dividends on April 8, 1885, and on Dec. 24, 1885, the stockholders received Dividend No. 13, aggregating \$580,000.

The output of gold dust from the placer mines of Deer Lodge county, for the year 1885, was about \$150,000.

At Virginia City, mining affairs are looking up. The famous Alder Gulch, which is estimated to have yielded from \$50,000,000 to \$75,000,000 in the aggregate, still yields from \$250,000 to \$300,000 per annum. The quartz mines of the various camps in the county are all very vigorously worked, and the results are reported to have been uniformly satisfactory. Those who are interested in the details of the various mines, can gain further information from the fine New Year's edition of the Butte *Miner*, which contains elaborate reviews of the various camps of the Territory.

A BILL has been introduced in Congress to make Montana a State.

NEVADA.

The mining industry in Nevada cannot be said to be generally in a very prosperous condition owing, mainly, to the decline in hulsion production of the junior Comstock lode. Yet on that lode the companies are working away as hard as ever in constant hope of again getting into bonanza. Last year at one time the lower levels were abandoned to the water, but now efforts are again being turned to deeper mining by the combined forces of several companies. The mines in the lode are all well equipped with machinery and its milling facilities are the best in the world. Some of the older and smaller companies, of which we used to hear in bonanza days, are doing nothing, but the larger properties along the lode are being systematically worked. Considerable hulsion is still being produced from ore mined in this lode, and the amount is such that in other camps it would be thought very great; but no dividends can be paid as the product is all used up in mining expenses. Immense amounts are paid out for labor and supplies annually. There is no thought of abandonment of the lode; on the contrary, renewed efforts are being made to pursue development in every direction. Those on the spot, who should know best, are very hopeful of striking good ore by following up indications.

Eureka district has many good and rich mines, two of which, particularly, the Eureka Consolidated and Richmond Consolidated, turn out immense quantities of base hulsion. The low price of lead has interfered with their business badly during the past year.

Some of the other camps have had a revival of late. This is notably the case at Aurora. Since the sale of mining property to capitalists recently, the prospects have materially brightened in that region. In fact, some years since, when Bodie was flourishing, material was taken from Aurora there; now the position is being reversed. There are several camps along the line of the Carson and Colorado railroad, which are in good condition. At Hawthorne the Lapanta and other mines are making a good showing. There is considerable prospecting going on in that region in the mining districts. A new mill has also been put up at Columbus district by the Candelaria Water Works and Mill Co., which will help matters in that camp.

In El Dorado canyon, Pennsylvania and Patterson districts, active mining operations are being pushed ahead. More active mining operations are expected to be carried on in Lincoln county this year than for some time past. We have given each week regularly the current news from Nevada's districts, so there is no necessity of our going over the ground at this time. The unsettled silver question has had much to do with the lack of interest in Nevada's mines of late. Men who have been investing on the Comstock seem to hesitate to go into the outside districts, in many of which capital is sadly needed, and where it would be well paid to invest. Men with really good mines seem to find it hard work to dispose of them or get the necessary reduction works. The districts in Southwestern Nevada are, however, now looking so well that more capital will doubtless be attracted in that direction in the future.

The State produces considerable borax, but even the borax industry has not been up to its usual standard for the past year.

Last year only 1500 tons of salt were shipped from the Eagle works on the line of the Central Pacific Railroad, in Churchill county. This is less than the amount formerly required to supply the demand of the Comstock alone, for milling purposes. In 1875 the salt produced commanded \$30 per ton. Since then the price has steadily declined, and it is now sold at \$17. The salt water flows from an artesian well, and is precipitated into vats excavated on the surface. This well is only 12 feet in depth.

We have elsewhere referred to Nevada's position in the list of hulsion producers.

NEW MEXICO.

The mining industry in New Mexico is not in as prosperous a condition as has been hoped and expected. The country badly needs the assistance of capital to develop what mines have been discovered; and it needs, also, mills and smelters to reduce the ore that is being produced. Where a lot of miners open their prospects and take out ore and can not sell it, or have it reduced, they, of course, become discouraged. There is little use in men trying to open mines under such circumstances, or to try and develop the country as it should be. The miners of New Mexico have had a great deal to contend with in this respect, and it is a wonder they have done as well as they have under the circumstances. The prevalence of Mexican land grants in the country has also done much to retard progress, as there is no use in miners finding mines where they can get no title to them.

The principal mining counties in the Territory are Colfax, Donna Ana, Grant, Lincoln, Santa Fe, Sierra and Socorro. In Grant county are the old mining camps of Georgetown, Silver City, Steeple Rock and others. The celebrated Lake Valley district in Sierra county is

the most important camp in the district, and many mines are being worked there.

All over the Territory, however, are many "prospects" and undeveloped claims. The Socorro *Bullion* has this to say concerning the mining industry: Out of the 30,000 mineral locations effected in Socorro county, in almost every instance the cause of the discovery is due to plain croppings above the surface, and there still remain, without the shadow of a doubt, large ore bodies, where the indicator caps or croppings of quartz, iron or spar have been swept away by the elements or obliterated by disintegration and then being covered by accumulated debris, and thus hidden away from the prying eyes of man.

Mining in the principal districts is now being performed on that class of claims which, as in the case of the Kelly, Graphic, Merritt and others, display their ore plainly to view. The time is, however, rapidly coming when prospecting companies will run their tunnels and sink their shafts on favorable looking sites with a view of intersecting pay ore bodies supposed to exist below the surface, as is done in Joplin, Leadville, and many older mining camps. This species of operation is hazardous, but it has resulted in the discovery of rich ore bodies. Our camps will be no exception to this rule. At this very moment a company has been organized which will make Socorro and Sierra counties the field of their operations. They have secured two tunnel sites in this county, and are prepared to make a considerable outlay of capital. From the meager information in our possession we anticipate a successful issue to their enterprise.

One fact remains uncontradicted: that there is still room for prospectors in Socorro county, and the coming year will be characterized by the number of prospecting companies who will send their agents to New Mexico to seek in several now neglected camps new sources of treasure.

OREGON.

More attention is being turned to mining in Oregon of late than for many years past. Southern Oregon particularly has done well. Several mills have been erected, and a great deal of prospecting is being done. During the year 1885 the product of placer gold in Baker county aggregated about \$900,000, and hulsion from quartz leads, gold and silver, about \$400,000. The present and prospective activity in mining gives promise of making the output of precious metals for 1886 several times greater than that of the year just closed. In Josephine county, where the principal industry is mining, during the past three years but little has been done—the seasons not being favorable. This year, however, a different state of affairs exist, as the rains came early and abundant, and many mines which have been idle for some time are now producing handsomely. It is estimated that more gold has already been taken out this season than during the whole of last. This being the case, the miners look forward to renewed prosperity, as a large per cent of the population depend upon the mines for their support. Many are prospecting, and some good quartz discoveries are occasionally made, which will be the ultimate means of introducing capital into the county.

All the miners in the Big Apple section are busy. There are 50 miners at work on Rogte river and its tributaries between the Big Bend and Mule creek, in Curry county. The indications are favorable for a prosperous season. In Steamboat district there is plenty of water this season, and the prospects are good. In Willow Springs and Blackwell districts a good deal of prospecting is going on. All over Southern Oregon there are hundreds of prospectors at work.

The excitement of the past year in Oregon was the Pine Creek mines. There was not enough done to really tell the value of the mines, but many think there will be a number of other good mines found in the district next spring. The great want of the region is reduction works. Numbers of miners have taken out small lots of ore, but they have no way of reducing or disposing of it.

The men who left the camp during the winter, after spending several months there, intend returning in the spring to resume work, an indication that they who ought to know best believe in the future of the camp.

There was some little talk during last summer of great success with the gold beach sands which could not be worked with much profit until a certain machine was invented. It seems now, however, according to the Coos Bay *News*, that the Pugh Black Sand Machine has proved an utter failure. At the Black Hawk mine the machine used up 100 pounds of quick-silver, with a result of \$2.50 in gold.

In addition to her gold and silver, Oregon produced last year 1965 tons of pig iron worth \$36,475, which shows a slight increase over last year's product and value.

UTAH.

Utah Territory has some of the best dividend paying mines of precious metal in the United States. Of late, too, her metallurgical industries have been advanced by receipts of ore from Montana and Idaho. Several of the Utah camps are doing exceedingly well, and shipping large quantities of hulsion. In another column we give a table showing the product for

all for purposes. **WORTHINGTON METERS** for pipes from 6-8 to
6 inches for measuring Oil, Wine, Water and other liquids.

THE WORTHINGTON PUMP IN LEVEL NO. 5, ALASKA MINE, SIERRA COUNTY, CAL.

LOCATION OF WORKS:
Pike City, Sierra County, Cal.

ALASKA MINING Co., 320 Sansome Street,
SAN FRANCISCO, CAL., July 15, 1885.

MR. A. L. FISH (Representing "The Worthington Hydraulic Works")—DEAR SIR: We started the Worthington Compound Pump on the 5th of June. It is the admired of all who see it working. We were burning 17 cords of wood per day pumping and hoisting (15 cords when pumping without hoisting) before starting the new pump, and 8 cords per day hoisting and pumping with the Worthington—showing a saving in pumping alone of 9 cords per day, at a cost of \$35.25 per cord, besides doing away with the services of two men for the 24 hours formerly required to wheel wood into the mill, effecting a net saving of \$35 per day in pumping alone. We carry steam down our shaft 500 feet. Too much credit and praise cannot be given it. We cheerfully recommend the Worthington Pump to all who require pumping machinery. Yours truly,

TO WHOM IT MAY CONCERN.

We claim for the Worthington greater economy than with any other pumping engine, and give herewith a few figures for consideration. The duty trials of Worthington Direct Pumping Engines at Salem, Mass., Newark, New

A. L. FISH, Sales Agent. 30 and 32 First St., SAN FRANCISCO.

Jersey, and recently at Buffalo, New York, show the consumption of coal, compared to that consumed (doing the same work) by rotative engines at Montreal, Canada, to be less than .31 per cent; Shepard engines, Buffalo, less than .42 per cent; Cornish engines, Louisville, Ky., less than .45 per cent; Cornish engines at Cleveland, Ohio, less than .55 per cent; the best Cornish engine in America, at Jersey City, N. J., less than .57 per cent; Fall River, Mass., Rotative engines, less than .33 per cent; and have all been superseded by the Worthington. The above-mentioned tests of Worthington Pumping Engines show a consumption of less than .45 per cent for the same duty that the Chicago Water Works engines show for nine years.

The Pumping Engines in use on the pipe lines of the National Transit Company are the Worthington Compound Condensing type of 500 to 800 horse power each, and are working against pressures of 1000 to 1500 pounds per square inch. The greatest distance between two stations is 114 miles. They are forcing oil from the oil regions of Western Pennsylvania to the cities of Buffalo, Cleveland, Pittsburg, Baltimore, Philadelphia, Jersey City, New York City, and through the Hudson and East Rivers to Long Island City Refineries. The oil is pumped over the Alleghany Mountains, 3000 feet high. The Pumping Engines built for the English Government, intended for pumping water across the African desert for the British Armies, are the Worthington. Every sale of the Worthington Pump is a guarantee for the purpose required.

Mining Review.

(Continued from Page 66.)

flat pieces. It is not yet found in paying quantity, however sanguine expectations are entertained by all interested parties that it will pay them.

ALASKA.

Very little note has usually been taken of Alaska, as far as mining is concerned, but it is now coming into prominence as a gold producer. It has now, on Douglas Island, one of the largest and most completely outfitted gold mills in the world reducing a low grade ore which is paying well. They are sending down about \$75,000 a month in gold from this mine alone. The mill has 120 stamps, with concentrators, etc. The mine appears to be a great mountain of quartz. In the rear of Juneau, two or three miles, on the mainland, is Silver Bow basin, where some rich placer mines are being worked. In the near vicinity of Sitka there are promising ledges. On Prince William, Cook's Inlet, in the Chilkat river and the Yukon, and in many other places, it is to be discovered.

From Ore Sales 2,375,820.84
Dore Bars 1,330 to have been discovered
Total 2,375,820.84

The mill has worked the past year to 94.95 per cent, 2½ per cent better than ever before, partly due to the large admixture of free ore from No. 3. The ore was graded 20 ounces lower than in 1883, but more ore was run through and more of the value was saved. Yearly they have improved in methods and appliances for extracting and reducing ores.

The cost of mining has been largely reduced, and treating has been brought to perfection. We need not describe the process—that of chloridizing and amalgamating. One hundred men are carried on the mill pay-rolls at an average wage of \$3.50.

From the organization of the Ontario Silver Mining Company and the starting of their mill February 1, 1877, to December 31, 1885, 144,568 tons of dry ore have been reduced and sold, the product of which sold for \$15,856,369.05. Prior to that the Ontario Company had realized \$1,014,596.96, representing, assuming that the ore graded the same as all the ore since, 10,290 tons of dry ore. The total output of the mine to date is, therefore, 154,858 tons of dry ore, realizing to the company \$16,870,966.01—\$102.42 per ton. The mine paid its 102d dividend of 50 cents per share—64 on 100,000, 38 on 150,000 shares—in all, \$6,050,000, December 31, 1884; \$51 per share on the old shares; \$19 on the new shares.

The property is chiefly owned in San Francisco, but is managed by R. C. Chambers, of Salt Lake. The cost of mining was approximately for 1885, \$12.00; of milling, \$14.27; general expense, hauling, prospecting and dead work, and repairs, \$5.43 per ton.

This mine is at Park City. Some of the minor properties of the same camp are doing well, but we have not space to mention them all. The Crescent, one of the big mines there, has some seven miles of cuttings upon it in opening up the ore bodies. During the past year there were driven drifts to an aggregate length of 3500 feet, while stoping was done to the extent of 108,000 cubic feet. In stoping, square sets of timbers are placed in, and what little waste there is is placed among the timbers to add strength. During the year there was used in timbering the mine 78,000 feet of timbers, 23,000 pieces of lagging, and 37,000 feet of other lumber. The company has on hand 50,000 feet of lumber and 70,000 feet of timber. During 1885 they extracted about 13,000 tons of first-class ore and 18,000 tons of concentrating ore. On the dumps there is fully 60,000 tons of concentrating ores to be sent to the mill. The output of the mine can be made almost any amount desired, since it has been so well opened. The regular employment of miners averages about 80. The capacity of the concentrator is 60 tons of raw ore per day, and it is proposed to increase this to 150 tons by the addition of more machinery. The first-class ore averages 35 per cent lead and 18 to 23 ounces silver. For the year ending Sept. 30th, they sold 11,581 tons of ore, which netted the company \$199,413. The amount of receipts, above disbursements, for the the year was \$138,470.

The Daly Mining Company's group of 75 claims on the western extension of the Ontario employs 80 men. They mine about 200 tons of 90-ounce ore per month. From the official statement published by Wells, Fargo & Co., compiled from Dec. 18th, 1884, to Dec. 17th, 1885, we calculate the output of the Daly Mining Company for the full year as follows: Dry ore, 9,154,494 pounds; containing silver, 475,451 ounces; containing lead, 1,131,265 pounds; net value realized, \$406,132.41.

For the most of the past year the Sandstone district, Silver Reef, Utah, has been very quiet. About November, however, discoveries began to be made of ore bodies, where their existence had never been dreamed of, and a good deal of what had been supposed to be "country" was found to be pay ore. These discoveries were, a good many of them, in old claims, the most notable exception being on the White Reef, west of the town. A good deal of activity resulted in the mining operations, but nothing on a large scale was added, and there is no call for more miners. Leachers have been

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, \$3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

and Uphi, over
Miner road for the year 1885
9521 tons. The effect of the advance in the price of lead may be seen as regards these districts in the monthly increase of ore shipments.

The Tintic country shows an increased output of silver-lead ores. The Eureka Hill comprising two locations yielded 11,300 tons of silver ore, running low in lead. Among other mines are the Red Bird, Keystone, Snow Flake, etc. The iron mines near Silver City shipped 9720 tons of ore during past year. There are quite a number of claims in that immediate locality which are doing well and give fine promise. The Northern Spy, managed by Colonel Graham, shipped 1100 tons high grade ore. The Martha Washington owned by Rife & Taylor took out \$800 in a small strike. In all there was shipped over the Salt Lake & Western, during the year 1885, an aggregate of over 34,000 tons ore, the value of which has not yet been made public. Besides this output Riter, Miller & Co. worked in the Homansville mill, which they have leased, ore that produced 25,465.25 ounces silver, and 410.57 ounces gold. There are many other districts of Utah which, if capitalists would take up, would doubtless prove rich. Utah can now, however, show a fine record, for the comparatively few mines being worked.

WASHINGTON.

Washington Territory has never been much of a gold producing region, her mineral resources consisting mainly in her coal mines. Veins and outcroppings of coal in almost every portion of western Washington indicate its general distribution and inexhaustible supply. On the Columbia river, lignite or brown coal appears in thin seams, extending continuously northward, the quality improving as we go north. The experience of a quarter century demonstrates the value of Washington Territory coal for economical and commercial purposes. Mines have been probably worked, and its coals rank among the best Pacific coals. In the fall of 1852, coal was discovered on Bellingham bay. From the first mines, 150 tons were shipped to San Francisco. The mine of the Bellingham Bay company was discovered in 1853, and opened the succeeding year. The San Francisco company which operated this mine continued the only exporter of coal for the territory down to 1870. In 1871 the exportation of coal commenced at Seattle. As early as 1854, coal mining had been pursued on Black river by Dr. Bigelow, but to no great extent. Concerning the coal mines the *Oregonian* further says: The Seattle, Renton and Talbot mines are in the vicinity of Seattle. The coal of all these mines is of the lignite variety, well adapted to steam and domestic purposes. The Seattle mine was discovered in 1866 by R. H. Lewis, who sold for \$30,000. The first shipment of coal was made to San Francisco in 1870, on the bark Moneyick, consisting of 405 tons. In 1874 the product was 50,000 tons. From July 1, 1878, to July 1, 1879, 155,900 tons. The year ending Dec. 31, 1879, 137,207 tons of coal have been produced. In 1874 the Renton mine was opened, producing during 1875-6 25,000 tons of coal annually. The Talbot mine, opened in 1875, produced in 1879 18,000 tons of coal.

The mining of coal is at present confined to King and Pierce counties. From January 1, 1884, to November 1, 1885, the King county coal mines yielded 413,315 tons. From January 1, 1884, to July 1, 1885, the Pierce county mines yielded 267,884 tons. Since that date the Pierce county mines have reduced their export until December, 1885, in which their shipment will probably reach 25,000 tons.

A few miners have lately been prospecting for gold about 25 miles southeast of Toledo, in this Territory. Gold is found in small quantity from the surface down as far as prospected, which is as yet limited to a ditch in order to get fall enough to wash coarse gravels with success, also with a view of going down to bed-rock, which is supposed to be about 15 feet from the surface. There are three kinds of the precious metal—shot gold, thread gold and

one-tenth that of Stamps.
The power per ton of ore crushed.
The wear is less than that of Stamps.
The wearing parts are easily duplicated.
It has a much better discharge and leaves the pulp in better condition for concentrating.
It is a better Amalgamator, saving fully nine-tenths of the gold in the mill (the balance can be saved on plates in the usual manner).
Its simplicity of construction obviates the need of mechanical skill.
It is continually crushing, not, like the Stamp, using power to suspend it in air ninety-nine one-hundredths of the time, and the balance, making a thundering noise and accomplishing comparatively small results. It is as far in advance of the Stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.
I challenge comparison with the Universal Stamp Mill, as well as all other systems of rollers, balls or pulverizers, before the public.

I claim special merit in that feature of my system by which I prevent ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ores containing sulphurets, I particularly claim the adaptation of my mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed), that a complete concentration of sulphurets is rendered most easy.

The Huntington Mill has passed entirely through the experimental stage. Three years of continuous use at a large number of mines in California has enabled the inventor to perfect and improve the machinery until he feels justified in assuring the public that he has reached the absolute in the construction of a perfect Quartz Mill.

The following will explain the accompanying cut: The ore and water being fed into the mill at the hopper, H, the rotating rollers and scrapers throw the ore against the ring-die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they pass over it. The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of 1 inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

The subjoined testimonials, from responsible mill men, show the high estimation in which the Huntington Mill is held by those who have practically tested it:

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR: After five months' trial of your Centrifugal Roller Quartz Mills, can say I am well satisfied with them, and can cheerfully recommend them to any one desiring to crush ore, wet process. We have three of your 3½-foot mills, with three rollers each; crushing capacity of three mills, 22 tons in twenty-four hours. This, with our hard ore crushing through a No. 8 slot screen, is very good work. Formerly we had a ten-stamp battery with stamps of 900 pounds each; crushing capacity, 15 tons of our ore in twenty-four hours. The power required for running the three Centrifugal Mills is not any more than would be required for a five-stamp battery, 900 pounds each. The cost of keeping these mills in repair is not more than 60 per cent of what it would be to keep a ten-stamp battery in repair, a saving all around, with a great deal less noise

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR: We have had one of your Centrifugal Roller Mills on the Eagle Gold Mine, and after which, by liberal offers from Stamp Mill Builders, we were induced to put up twenty stamps on the same mine, which we run in connection with your Centrifugal Roller Mills for several months, when we purchased the Spanish Mine at Washington, Nevada County, Cal., on which we decided to use your mills in preference to stamps. We are now running two of them on the Spanish Mine, crushing 60 tons per day, and we expect shortly to erect several more of your largest mills on the same mine. The mill meets every claim you make for it. Our order for the fourth mill after 18 months' trial evinces our faith in them and the great satisfaction their use has given us, and I am pleased to give them my unqualified endorsement, and can cheerfully recommend them for crushing (wet process) any grade of ore, either gold or silver.
Respectfully,
CHAS. B. SHATTUCK, Superintendent.

SAN SEBASTIAN GOLD MINING COMPANY'S OFFICE,
SANTA ROSA, SAN SALVADOR, CENTRAL AMERICA, August 4, 1885.
Frank A. Huntington, Esq., San Francisco.—DEAR SIR: I started your 3½-foot mills, and the two gave a good record of themselves. I had almost lost faith in getting a pulverizing mill that would answer in the place of stamps, but this is their record: I run 461 tons and 1700 pounds through the two mills at the rate of over 30 tons in 24 hours for the two mills. The small rings are not out of round, and do not pound, and will last for 150 tons more. I wish to congratulate you, and do so most heartily, for having the only wet pulverizing mill I ever saw that is a success.
Respectfully yours,
J. A. SPERRY.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR: In regard to your mill (Centrifugal Roller), I have crushed about 500 tons of rock in the mill, and am glad to say that it has given entire satisfaction, and can recommend it to the public as the most expeditious and least expensive method for crushing and milling ore that I have ever seen.
Truly yours,
THOS. HILDRETH.

Mr. F. A. Huntington.—DEAR SIR: We have had one of your Centrifugal Roller Quartz Mills in operation for the past three months, and can safely say that it is one of the best mills in use for crushing quartz and amalgamating gold. It is cheap and efficient, and will do all you claim for it. Yours respectfully,
JEWETT, SEAMANS & CO.

[Extract from letter.]

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR: The ring and springs came to hand to-day. The mill runs like a daisy. We are opening up a fine body of ore, and have got the best little mill in the State. We have run three weeks, and the ring, die and rollers do not seem to show hardly any wear, and we have not worn out one set of screens yet.
Yours truly,
P. VEASEY, 222 Davis St., S. F.

Mr. F. A. Huntington.—DEAR SIR: After using one of your mills since the first of June, I am fully prepared to recommend it. It has a good crushing capacity; it is simple, durable, and easily managed, and will save more gold in the battery than any other mill, and is, beyond a doubt, the best mill now made.
I am, sir, yours respectfully,
R. B. STOCKTON.

Fine Gold District, Fresno Co., California.

Mining Review.

(Continued from Page 66.)

flat pieces. It is not yet found in paying quantity, however sanguine expectations are entertained by all interested parties that it will pay them.

ALASKA.

Very little note has usually been taken of Alaska, as far as mining is concerned, but it is now coming into prominence as a gold producer. It has now, on Douglass Island, one of the largest and most completely outfitted gold mills in the world reducing a low grade ore which is paying well. They are sending down about \$75,000 a month in gold from this mine alone. The mill has 120 stamps, with concentrators, etc. The mine appears to be a great mountain of quartz. In the rear of Juneau, two or three miles, on the mainland, is Silver Bow basin, where some rich placer mines are being worked. In the near vicinity of Sitka there are promising ledges. On Prince William's Sound, Cook's Inlet, in the Chitka river country, on the Yukon, and in many other localities, gold is reported to have been discovered. Coal, iron, copper and other minerals are reported as having been found at various points in the Territory. At Killisnoo, on Admiralty Island, there are bituminous coal seams, from which some coal has been mined, and from which one of the resident officials of the Northwest Trading Company obtains his regular supply of fuel; but the seams are badly broken up, and the coal unfit for use under steam boilers. The specimens of iron ore shown are very fine.

The Silver Bay mines have recently been purchased and will be opened when the season begins this year. The work will serve to test the value of the quartz veins of Sitka district. The prospectors from the camps are working in such directions as it is possible to go and probably more discoveries will be made. The difficulties of travel and transportation in Alaska, however, are very great, and it is no country for a poor man to go to as yet.

Testing and Working Silver Ores

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting, ore, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protodichloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, waste of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Knecht's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 252 Market St.

A YANKEE SCHOOL TEACHER IN VIRGINIA.—A tale of the Old Dominion in the Transition State. By Lydia Wood Baldwin. 12mo, 238 pp., paper. Price 25 cents.

"A work that has all the value of truth and all the interest of fiction. We could not name another volume where life among the negroes of the South is portrayed with such evidence of intimate knowledge of their habits, beliefs, superstitions and modes of every day life. Withal, it evokes many hearty laughs."—*Burlington Hawkeye*.

We will furnish (within 20 days at farthest) the above work, post-paid, at half price to new or old subscribers on paying for this paper up to one year in advance of this date. See our offer of desirable books on similar terms inserted from time to time in this paper.

THE S. F. HOLINESS MISSION gave 1194 meals at their free soup-house during the week ending Jan. 18th—the number ranging from 156 to 183 per day. Of these, only six were furnished to women and children; although 33 families applied for relief. Forty-nine were refused on account of drunkenness or other unworthiness. Lodging was afforded one, and employment obtained for two. Nine thousand two hundred and eighty-five meals, in all, have been given up to date. The association invites parties who would engage help to apply at their free employment bureau.

A SINGLE leather belt, one inch wide, traveling 800 feet per minute, will transmit one-horse power, provided the pulleys are the same.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, \$3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

Missing Papers.

We mail and send our papers to subscribers as carefully and regularly as possible, but changes occurring sometimes in our mailing hands, by illness or otherwise, or changes in the Postoffice here or at the place of delivery, may cause irregularity in the receipt of the paper by the subscriber. We therefore request that *always*, when subscribers fail to receive their paper in due time that they notify the office by postal card or letter, and we will, if possible, remail all missing numbers.

A SUPERIOR BLOTTING PAPER has been produced. It is saturated with a solution of oxalic acid and dried, and will not only absorb the ink of a blot, but will remove the blot itself, if the ink does not contain indigo or aniline color. It might be dangerous in removing signatures from important papers, but the trace of the writing will remain, and can be made legible by adding ferrocyanide of potassium or gallic acid.

A NEW BANK NOTE.—An entirely new kind of bank note, printed in colors instead of black and white of the Bank of England notes, is being prepared for issue by the Bank of Scotland. The chief novelty of the new note is its colors, which will, of course, make reproduction by photography impossible, and it is believed will prevent forgery.

A GOOD PREMIUM!

WEBSTER'S PRACTICAL

Probably all of our readers have occasion to use a dictionary every day. In some cases words cannot be correctly spelled; in others, the pronunciation is difficult; while in still other cases the meaning is not understood. This is true, not only of children and of the uneducated, but of many of the more intelligent as well; and every one who attempts to do without Webster's Practical Dictionary attempts to do without one-half of his opportunities for intellectual improvement.

Webster's Practical is an entirely new work by the editors and publishers of Webster's Unabridged and contains more than twice the amount of matter and illustrations ever before offered for the price.

It also embodies several entirely new features which render it pre-eminent to such a degree that for general reference in every household, it will not pay to use even the best of the older works any more than it would pay to journey across the continent in a lumbering old stage-coach while the numerous advantages of a lightning express are available. Those wishing to see sample pages and learn the particulars in regard to these new features before purchasing, should send their address to
S. S. WOOD, Sole Agent,
134½ West 33d St., N. Y.

SPECIAL OFFERS:

Webster's Practical Dictionary will be sent postpaid as a present to any person who shall send two new subscribers for THIS PAPER, or for one new subscription two years in advance.

TO SUBSCRIBERS

Who will pay ONE YEAR IN ADVANCE for this paper (while this notice appears), and 50 cents extra, we will send the Dictionary postpaid.

For further information ADDRESS THIS OFFICE, 252 MARKET ST., S. F.

Manufacturers of

MINING MACHINERY, ENGINES, BOILERS, Etc.

We are manufacturing from Special Designs of the most experienced and successful Practical and Scientific Experts, Complete Plants for all descriptions of Mining Operations, as follows:

CONCENTRATING MACHINERY—Best and Cheapest, Cornish Rolls, all Steel Wearing Parts, Most Practical Styles of Two, Three and Four Compartment Double and Single Jigs, Sizing Screens, Patent Hydraulic Separators, Tables and Concentrators.

STAMP MILLS for Reduction of Gold and Silver Ores, whether free milling or base. Most useful and substantial styles of Single and Double Discharge Mortars, Wet or Dry Crushing.

STEEL SHOES AND DIES, Tappets and Cams, cheapest and best Blake Improved Rock Crushers and Automatic Ore Feeders, Superior Amalgamating Pans with wood or iron sides.

PANS FOR TREATING GOLD ONLY, Settlers, Clean-Up Pans, Retorts, Furnaces, Dump Cars, Hoisting Machinery, Cages, Landing Dogs, etc.

CORLISS, MEYER'S CUT-OFF AND BALL'S PATENT VALVE Engines of extra strength and durability.

STEEL BOILERS of Two Sheets only, Steel Economic Boilers, combining with the safety, durability and economy of the Stationary Boiler, the convenience and portability of the Portable. It occupies but little space, and is the best and cheapest boiler ever made.

WE ALSO MANUFACTURE SAW MILL MACHINERY.

We are also Sole Agents for the Gordon and Maxwell Steam Pumping Machinery, and carry a full stock of all kinds of Mill Supplies, including the

Albany Lubricating Compound and Oils.

RANKIN, BRAYTON & CO.,
BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street.
Chicago: 100 N. Clinton.
New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all the AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 200 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO, CAL.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take the valve off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." Machine made entirely of crucible
steel; light, compact and durable.
Strikes 300 blows per minute with 7-
lb. hammer. A perfect reproduction
of hand drilling; will drill one inch
per minute in the hardest rock,
using one-quarter the number
of drills required by hand
labor.

Machines on ex-
hibition at No.
32 First St.,
San Fran-
cisco.

Send for
circulars.

C. O. BARLOW, General Manager.

CATARRH

HOLDROCK'S
ELECTRIC
CATARRH AND
ASTHMA CURE

A wonderful medicine. Instantaneous
and lasting in its effects. Convenient of
application. One bottle will cure any case.
Ask your druggist for it, and if he does
not keep it, order from the undersigned,
who will forward it, post-paid, to any ad-
dress, on receipt of \$1.00. If not found as
represented the money will be refunded.

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications furnished for the
most suitable Process for Working Ores.Special attention paid to Examinations of
Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,

(Formerly Huhn & Luckhardt),

Mining Engineers and Metallurgists.

C. H. AARON,

ASSAYER AND METALLURGIST,

NOGALES, ARIZONA,

Will attend to business in connection with mines in So-
nora or Arizona.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

Assayers' Materials,

MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG-
GISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco.

We would call the attention of Assayers, Chemists,
Mining Companies, Milling Companies, Prospectors, etc.,
to our full stock of Balances, Furnaces, Muffles, Crucibles,
Scorifiers, etc., including, also, a full stock of
Chemicals.

Having been engaged in furnishing these supplies since
the first discovery of mines on the Pacific Coast, we feel
confident from our experience we can well suit the de-
mand for these goods, both as to quality and price. Our
New Illustrated Catalogue, with prices, will be sent on
application.

Our Gold and Silver Tables, showing the value per
ounce Troy at different degrees of fineness, and valuable
tables for computation of assays in grains and grammes,
will be sent free upon application. Agents for
Plumbago Crucible Co., London, England.

JOHN TAYLOR & CO.

Pacific Reduction and Metallurgical Works.

SALAZAR & KUSTEL.

Location of Works: Melrose, Alameda Co., Cal.

Office: 318 Pine St., San Francisco.

Gold and silver ores of every description, from \$10 up-
ward per ton; Jewelers' sweepings and scrapings bought
or worked for the owners at a fixed rate per ton. Rebelli-
ous ores especially solicited. Ores worked and practical
working tests made by any process, to wit: Amalgama-
tion in battery and copperplates for free gold ores.
Amalgamation in pans for silver and gold ores, with or
without roasting. Leaching of silver ores. Chlorination
of gold sulphurets. Assaying, Chemical Analyses of Ores,
Metals and other substances.

THE Merced irrigating canal is rapidly approaching completion, and water is expected to supply the ditch in April. Everybody is looking for good times and lively business the coming season.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examination ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

\$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

Newspaper Agents Wanted.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference.—DEWEY & CO., Publishers, No. 252 Market St., S. F.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their Scientific Press Patent Agency (S. F.) from week to week and year to year.

SOME of the valley land above Napa is being drained with tiles.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als. Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our
**IMPROVED
HYDRAULIC
MACHINE.**

IT OFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT Instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.

HOSKIN & CO., Marysville, Cal.

NEW BOOKS ON ASSAYING.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Methods; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Farding; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Hydric Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, \$1.75. Sold by Dewey & Co., Publishers, No. 252 Market St., S. F. These are much needed books for miners and other practical men, by an intelligent miner and assayer and careful writer. They are invaluable for the mill and mine worker, and equally good for scientific experts. They are thoroughly practical books.

Lost Papers.

If any subscriber fails to receive this paper promptly after making due inquiries at the Postoffice, he is urgently requested to notify this office by letter, that we may send the missing papers, and, if possible, ward against further irregularities.

ARIZONA's public schools are being closed for want of money.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

AN EXTRAORDINARY RAZOR

HAS BEEN INVENTED BY THE QUEEN'S OWN COMPANY, of England. The edge and body is so THIN and FLEXIBLE AS NEVER TO REQUIRE GRINDING and hardly ever setting. It glides over the face like a piece of velvet, making shaving quite a luxury. It is CREATING A GREAT EXCITEMENT in Europe among the experts, who pronounce it PERFECTION. Two dollars in buffalo handle; \$3 in ivory. Every razor, to be genuine, must bear on the reverse side the name of NATHAN JOSEPH, 641 Clay street, San Francisco, the only place in the United States where they are obtained. Trade supplied; sent by mail 10c. extra, or C. O. D.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half-year ending December 31, 1885, the Board of Directors of the German Savings and Loan Society has declared a dividend at the rate of four and one-half (4 1/2) per cent per annum, on term deposits, and three and three-fourths (3 3/4) per cent per annum, on ordinary deposits, and payable on and after the 23 day of January, 1886. By order. GEO. LETTE, Secretary.

HEALD'S BUSINESS COLLEGE, 24 Post St. S. F. Send for Circular.

An Easy Binder.

A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price, (size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Publishing Co.'s journals, Harper's Weekly, and Scientific American), 85 cents; postage 10 cents. Postpaid to subscribers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining
Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.
E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general
complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating
looks the same as heavy, but has no durability. Good plates can be furnished at same price these rock plates cost.

Wheeler's Improved Surface Condenser.

Surface condensers are coming into very general use, both for marine and stationary engines, and the more they are known the better they are appreciated. The surface condenser differs from the ordinary jet condenser in that the injection or condensing water does not directly come in contact with the exhaust steam from the engine, and therefore does not mingle with the water fed to boiler. The distilled water resulting from the condensation of the exhaust steam is alone used for supplying the boiler, and as this water is necessarily pure, a great saving to the life of the boiler is the result, as also economy in fuel.

On land there are many places where impure or objectionable water abounds (not suitable for feed purposes) that could be utilized with great effect for condensing purposes. We refer to places located by muddy rivers, or where the water is impregnated with lime, salt, or other matter which creates scale. By the use of a good surface condenser this trouble (to say nothing of the expense and danger to boilers) can be avoided, and at the same time a saving of from 15 to 25 per cent of fuel secured. For marine service the surface condenser is now regarded as a necessity, for it does away with the expense and room for carrying a supply of fresh water. The steam that is condensed is fed directly to the boiler in its hottest condition, and so used over and over again.

In the older forms of surface condenser, the tubes run from end to end straight through the heads or tube sheets like the tubes in a steam boiler, with this difference—that the ends of the tubes are packed (as a piston rod is packed), with some material which will insure their being steam-tight, and at the same time permit them to move freely when they expand and contract.

As this packing cannot be readily adjusted, but is either tight or leaky, according as it is made, it is always a source of anxiety to the engineer. The tubes, under varying temperatures, expand considerably endwise, producing a movement called "creeping," which sometimes draws them entirely out of the tube sheets. Then, if the packings grip the ends of the tubes so tight that the leather cannot move freely, rupture, or springing of the tube heads is the consequence.

Unequal distribution of steam over the cooling surface, so that parts of the condenser are hot, while other parts are cold, insufficient vacuum, condensed steam (feed water), not as

hot as it should be, liability of the circulating water to leak into the steam space, and mix with the water of condensation, are also common faults of many surface condensers. The engraving herewith shows an improved condenser, which is the invention of Mr. Fred'k M. Wheeler, and possesses many valuable and novel features, combined with practical qualifications. Briefly stated, this improved surface condenser is claimed to possess the following advantages:

The tubes are so arranged that they are free to expand and contract without the use of

is as follows: The exhaust steam from the engine entering the condenser by nozzle, A, first comes in contact with the perforated scattering plate O, which protects the central portion of the upper tubes from the deteriorating effect of the direct impingement of the steam. The steam expanding in the spacious top of the condenser, reduces its pressure and temperature before it comes in contact with the cold tubes. The steam, as soon as condensed, gravitates to the bottom, and passes out by the nozzle B to the air pump.

It will be noted also that there is ample room

so that coarse deep threads and a slot can be cut; this latter is similar to the slot shown in N, which admits a screw driver tool for screwing up or unscrewing tubes from the tube heads. When necessary to remove the tubes for cleaning or repairs, both small and large tubes can be drawn out from the same end of the condenser. After removing the small tube the large tube is unscrewed and drawn through the hole left vacant by the screw head of the small tube, this hole being a little larger than the thick end of the large tube. As an evidence of the remarkable efficiency of the Wheeler

Condenser, we find it stated that carefully conducted tests have shown a result equal to nearly 200 pounds weight of condensed steam per hour per square foot of condensing surface, which result is something like three times greater than any previous construction of condenser has given. This is ascribed to the very effective and rapid circulation of the condensing water produced by the arrangement and form of tubes thus making more efficient, the cooling surface exposed to the steam. Messrs. H. P. Gregory & Co., 2 and 4 California street, S. F., are agents, who will be pleased to give any further in-

WHEELER'S SURFACE CONDENSER FOR MARINE OR STATIONARY ENGINES.

packings of paper, wood, or similar materials; in fact there are no ferrules, followers, washers or packings of any kind employed. Plain screw joints only are used, the simplest, most durable and efficient tube fastening possible, and always tight.

The tubes are straight, of seamless brass tubing, and carefully tinned inside and outside. They can be easily and thoroughly cleaned, as their form and the means of fastening permit of this being readily done. The tube heads do not have to be removed from the main part of condenser for the cleaning or repairing of tubes.

The pressure (and likewise the temperature) of the exhaust steam as it enters the condenser is reduced to a minimum, and then is uniformly distributed over the cooling surface. This, together with a perfect circulation of water in the tubes, produces a more uniform temperature in the condenser, making one portion as efficient as another, and economizing the amount of circulating water and cooling surface.

The water of condensation passes from the condenser at the hottest temperature possible. The circulation is very active and thorough; consequently a smaller amount of circulating water is required. This feature gives a marked saving in the capacity and power necessary to work the pump. The operation of the condenser

in the bottom of the condenser for the water of condensation, so that it cannot come in contact with the cold tubes and become chilled. The hot water therefore passes out at the highest possible temperature, according to the vacuum carried.

The circulation of the condensing or cooling water is as follows: It is pumped into the compartment F through the nozzle C and enters the smaller tubes of the lower section as shown by the arrows. After traversing the smaller tubes, the water returns through the spaces between the small and large tubes, and empties into the compartment G; from thence it passes into compartment H by the passage way E. The water then passes through the tubes of the upper section (in the same manner as described above) into the compartment I, and finally passes out of condenser by the discharge nozzle D.

The upper part of engraving shows one of the small and large tubes in section. The small tube M is expanded into the screw head N, which latter screws into the head K. This small tube ends within a few inches of the cap G of the large tube L, thereby giving ample space for the water to reverse its direction before flowing back through the annular space between the two tubes. The end of the large tube that enters into the head J is drawn thick,

formation required. This condenser is new to the coast, but where it has been used has given very satisfactory results.

MINING has not yet taken its legitimate place in the confidence of investors but it is certainly and deservedly gaining ground in this direction. Never before, perhaps, has the industry paid a better average return on the capital actually engaged in working the mines. The period of inflation in mining values has passed, and there is to-day no other industry in this country that offers so large legitimate inducement of capital as the working of prudently selected mines.

THE managers of the Peer, Peerless, Crocker and other leading mines in Quijota District, Arizona, have decided to stop all other work and explore the ground with a tunnel at a depth of 1,000 feet. The tunnel has already been started, miners having been procured who are willing to work for \$3 per day—a reduction of \$1 per day on the rate previously paid. The tunnel will speedily show whether there is any merit in these much-talked-of mines.

THE great Tintic mining case decision we shall give in full next week, as it is highly important and of great interest to miners, involving several questions which affect all lodes,

CORRESPONDENCE.

Exhaustless Gold Repositories.

The Quartz Lodes, Porphyry Veins And Ancient River Channels of Sierra County, Cal.

[Written for the Press.]

Now that the spell of the Silver Wizard in far desert regions is waning, man of the pick and parse alike are becoming cognizant of the vast and accessible gold reserves stored up in the inde-ribbed western slopes of the Sierra Nevada, which are, as yet, practically virgin to the miner.

From the surface gleaming of detrital gold and the skimming of auriferous veins have mainly come the quickening streams that now swell the world's trade arteries.

Great as these streams have been in the aggregate since '49, they are but the advance flow of a vast treasure-tide yet to be poured from the fecund vein sources of the Sierras.

The notahs diminution of the gold-flow after the first few years of discovery was due, as is well known, to the partial exhaustion of the gold made easily accessible by the natural segregation and concentration of the metal from its matrix through immeasurable cycles of time.

What nature did for man ages before his appearance upon the planet, he must now do for himself, not in nature's deliberate way, by the slow erosion of mountain masses under elemental action and gravity, but by the discriminate exploitation with scientific appliances of the gold lode which traverse them.

Advantages of Gold Mining, Quartz Averages, Etc.

While gold mining is the most attractive, it is also one of the safest and most generally profitable of mining pursuits.

The producer of gold has especial advantages in the compact character and unvarying value of his product; nor is he ever so dependent on transportation facilities and markets as is the producer of silver and the base metals.

Moreover, the gold tracts chiefly lie in lofty and salubrious mountain ranges, which are heavily timbered, deeply eroded and abounding in water courses—conditions all most favorable to economical mining.

The reverse is generally true of the regions where silver and the base metals are most extensively won; the essentials of timber and water being nearly as precious from scarcity as the minerals sought after.

We may have, from overproduction, a plethora of silver, copper, lead, antimony, coal, petroleum, etc., even a plethora of diamonds, but never a glut of gold.

In the extraction of gold the appliances and metallurgy are usually so simple that gangue matter yielding not more than four or five dollars per ton may be, and is, made profitable under favoring conditions—a yield quite inadequate in the case of other metals.

Some of the Black Hills mines and Australian quartz reefs probably furnish the most notable examples of remunerative dividends by mill process from vein-stuff yielding no more than \$4.50 per ton.

As yet very few of our California gold lodes have been extensively worked on so low an average yield.

Amador county mines have paid generously on investment from \$7 to \$9 quartz; Nevada county (Grass Valley particularly) has distributed its millions from smaller but richer veins, averaging not less than \$15 per ton.

The Sierra Buttes mines of Sierra county, have paid dividends for twenty years to the English stockholders from quartz averaging, about \$0.50 per ton.

The Chute or Bonanza Lodes.

With this class of quartz-veins, of which the Eureka, Rocky Bar, New York Hill and other Grass Valley mines are representative, certain parts of Sierra county are thickly threaded.

These, gauged by the standard of silver or copper veins, are usually small, but there is an extraordinary concentration of the precious metal in them; for, by one of nature's kind adjustments, the low-grade lodes are generally wide, and, as a rule, the narrower the vein the richer it will be found.

Doubtless the richest and greatest concentration of these veins is in the region embraced between the Middle and North Yuba rivers, the extreme southwestern limit of which is at the Alaska and Grizzly mines, Pike City, and the northeastern at the Sierra Buttes, a distance of 25 to 30 miles.

This region is fissured by numberless ravines and canyons, all of which have been very prolific in gold, notably Kanaka creek and tributaries, from which millions have been gleaned.

Throughout this area are dozens of lodes which have yielded comfortable bonanzas by chance discovery, or in desultory prospecting thereupon; yet which, save in a few instances, have never been opened up for systematic mining.

Many of these lodes are held under location

titles from year to year, by men who lack either the means or the surgery to exploit them; and notwithstanding their extraordinary yield near the surface, by far the greater number remain unexplored to any considerable depth.

The few already known and partially developed are worthy of especial attention in view of their history, characteristics and future promise as gold producers.

Hers is an inviting field for profitable enterprise, for although there have been failures through ignorance, extravagance and rascality, and though even here the unscrupulous schemer and stock jobber has had his day and left this blight of his presence, these hills are obviously replete with gold, and whatever the haseness of man has done, or may do,

Nature Does Not Here Lie in Her Promises.

The lodes are mostly of pure quartz, in well-defined, true-running fissures lying between metamorphic schists and porphyry, or serpentine; the gold occurs in "chimneys" or "chutes" of varying extent, and is generally free, though often accompanied with auriferous pyrites, or with mispickel very rich in gold.

Extraordinary finds are frequent in the annals of this quartz zone, and a decent fortune has occasionally been thrown out by a single lucky blast.

All the ravines intersected by these lodes have been rich in rough or partially abraded gold, indicating the near-by sources; and many of the gulches have yielded largely in float gold quartz and boulders, single specimens of which have contained \$5000 or more.

Gold Product of Certain Lodes

While exact data are not at hand, I can give the approximate output of some of the representative lodes of this class in the region described, as follows:

Alaska.....	\$700,000
American Hill.....	150,000
Brush Creek.....	450,000
Docile.....	150,000
Fellows.....	350,000
Hoadley & Bowles.....	150,000
Oriental.....	450,000
Plumbago.....	200,000
Rainbow.....	500,000
Wolfe Creek.....	170,000
Total.....	\$3,270,000

Here we have a yield of three and a quarter millions from a few small mines, hardly known beyond the county limits, a considerable part of which has been obtained in desultory and haphazard working near the surface, and with appliances wholly inadequate.

In regard to the average yield per ton of the mines named, I have no reliable statistics, save in the case of the Alaska mine, the central pay chute of which the writer discovered and worked to a depth of 260 feet in 1869.

A considerable length of surface ore on the Alaska, east of the main shaft, yielded \$35 to \$40 per ton.

Some 1600 tons worked in a five-stamp mill from the central pay zone yielded \$39 per ton by simple battery amalgamation, and returned the partners at that time, \$10,000 each, beyond outlay.

But the golden reserves of Sierra county are not limited to this class of narrow, high-grade quartz veins. Low-grade gold lodes of great width are numerous, and, in the main, well situated for economical exploitation and water power reduction.

These are yet undeveloped, for the surface sluicing and "coyoting" of local prospectors cannot be considered a development, nor even a practical test.

Porphyry Veins and Dead Rivers.

This part of the county also abounds in porphyritic veins or dykes, locally and erroneously called "tale" veins, which cleave the foundations, and are apparently as well walled, regular and persistent as the quartz lodes. They are often quite rich, and in their disintegration have furnished a considerable part of the detrital gold of certain localities. The gold occurring in these veins is found associated with the quartz and ferruginous stringers which interlace the gangue stuff from wall to wall. These deposits are worked in favorable or specially rich spots by ground sluicing, the vein material being usually decomposed to a considerable depth.

Doubtless many of these, if opened and equipped for extensive operations, at points where water-power is abundant, can be made highly profitable mines.

This rich section of California also holds other very important gold sources in the deeply buried ancient rivers of the Pliocene epoch, whose lava-crust channels lie athwart the present drainage system.

These constitute the deep drift diggings, which have their most salient representation and development at and in the vicinity of Forest City, and which, in extent, permanency and productivity rank next to the lode mines.

Of this class the Bald Mountain mine alone has yielded some two and a half million dollars, 50 per cent of which has been disbursed in dividends.

To the shrewd man of means desiring safe and profitable business, or investment, beyond the reach of economic convulsions, the fluctuations of markets, the fierce rivalries of trade and the hazard of stocks, in a climate unrivaled for salubrity, one of these gold mines, secured by United States patent and managed on business principles, offers all he could reasonably desire either for immediate revenue or for a future reserve.

MILES FAUSON.

Measuring Silver Globules.

[Written for MINING AND SCIENTIFIC PRESS by C. H. AARON.]

EDITORS PRESS:—In your issue of the 9th inst., is an article on measuring globules of silver, which, though literally correct, contains that implied error which is to be found in nearly all, if not all, the literature on the subject, not only of blowpipe work, but of volumetric determinations in general. The error consists in conveying the impression that certain fixed dimensions of the apparatus are essential.

In my book on assaying bullion I have explained that it is not necessary that the pipette used for the normal solution in the humid assay of silver should contain exactly 100 C. C., as usually implied. In assaying gold and silver ores I have stated that the weights used need not conform strictly to any particular standard, provided they are correctly proportioned in known ratio among themselves, and I now come forward, in behalf of young, and perhaps poor students, to show that a Harkort scale for measuring silver globules need not be so constructed as that "at this distance of exactly six inches" from the point of intersection "they are precisely .04 parts of an inch apart," which, with the implied necessity of dividing the six inches into precisely 100 equal parts, might well discourage a boy from attempting what he may easily do, namely, make a scale for himself.

Many years ago I was somewhat of an enthusiast in blowpipe work, especially in quantitative assaying of gold, silver, lead, copper, tin, bismuth, nickel and cobalt. I made my own apparatus in great part, and among other things I made four measuring scales, two of which I still use on occasion, and neither of them were six inches long, nor do I yet know the precise divergence of the lines, which was not the same in any two of the scales.

I bought a piece of ivory, sawed it into strips about five inches long and less than a quarter inch thick, smoothed and polished them by coarse and fine sandpaper, and finally by chamois leather, chalk and oil. Dressed the point of a good penknife on an oil stone by the aid of a lens. Made a straight edge from the base plate of an old thermometer, by grinding it on a marble table. Laid the straight edge on the ivory and drew the point of the knife along it. Swung the straight edge slightly on a point near one end of the ivory, and made another stroke of the knife. Rubbed lamp black into the cuts, and examined the lines in a strong light with a lens, found the lines defective, worked them out with sandpaper, etc., and made them again and again until they were good.

Using the same straightedge, not moving it except to rotate it slightly on a given point, any little inaccuracy in it was harmless, as the two lines were alike. Aided by sunlight, lens, good eyesight and patience, sought the extreme point of the strip of ivory between the lines. This is what is required; not the point of intersection of the centers of the lines, but that of their inner sides, for the lines, however fine, have breadth, and the globule is to be placed between them. Having found the visible extremity of the space between the lines, and allowing about the thirty-second of an inch for the small portion inevitably torn off, I made a mark by means of the knife and lamplack; then, with a pair of fine-pointed dividers, set to approximately the hundredth part of the length of the scale, I walked off 100 equal spaces from the mark toward the divergent ends of the lines, pressing so as to make little holes, into which I rubbed lamplack. At each dot thus made I drew a fine line crossways, but not intersecting the side lines. In this way, working a couple of hours daily for three weeks, I made four scales, one of which was pronounced by Mr. Rhien, the assayer, to be the most perfect he ever saw.

I had then to find the weight of the gold or silver globule corresponding to the marks on each scale. This was done as follows: A piece of pure gold was melted with some pure lead and cut into about a dozen pieces. Each piece was cupelled by blowpipe in a cupel of levigated bone ashes. The beads thus got were so large as to be measured near the open ends of the lines, consequently they could be weighed on a fine assay balance. Each bead was measured, and the number of the division on the scale noted. Each bead was then weighed separately and its weight noted. All of the beads were then weighed together and the difference between the total weight and the sum of the separate weights was divided into as many parts as there were beads, and the weight of each corrected proportionately.

The number of the division on the scale corresponding to each bead was then cubed and divided by the corrected weight of the bead (in half milligrams, but any other system would answer equally) the result was, approximately, the weight of a gold bead which would measure 1 on the scale. Of course the different determinations varied; extreme variations, of which there were one or two, were rejected, and the mean of the others was taken as the absolute weight, in half milligrams, of a bead measuring 1.

The value of 1 on the scale being thus found is a factor by which to multiply the cube of each succeeding number on the scale, giving the weight of the bead of corresponding diameter. I made a table of these weights.

In order to form a table for silver globules,

it is not necessary to go through the same process. If the forms of the silver globules were the same as those of the gold, the relative weights might be found by the specific gravities of the two metals, but Plattner found that gold globules were slightly less flattened than those of silver. That illustrious blowpiper has given us the relative weights of gold and silver globules of equal diameter, as found by careful experiment as follows: As 1.4 is to 3, so is the weight of a silver bead to that of a gold bead of equal diameter. The weights for gold having been found as described, those for silver may be calculated by this rule.

I prefer gold beads for the determination of values on the scale, both because they are heavier and, consequently more accurately weighable, and because, owing to their color, they are also better to measure. The principle of the scale consists in the well known mathematical law that "the solid contents of similar bodies are as the cubes of their similar measurements." The flattening of the beads on the under side would not cause any error if all were flattened proportionally alike, but the larger ones are more flattened than the smaller, yet, within the legitimate scope of the instrument, the error thus caused is not important; nevertheless it is better to weigh those beads which come near to the wider end of the scale, if a delicate balance is at hand.

In regard to the assay of gold, though it is susceptible of sufficient accuracy for some purposes, it cannot be as close as that of silver, owing to the greater density and higher value of the metal. The parting is best done in a minute porcelain basin, and, if the gold falls to powder, it is collected and washed on a very small filter which is then dried, dressed with some pure lead and borax, and smelted on charcoal, the button being cupelled on an extremely fine cupel and measured on the scale. I have found it best to wash the gold with ammonia instead of water, as either the water or the filter is liable to retain a little silver, rendering the gold bead impure.

For handling minute beads, a watchmaker's fine pinnettes are best. The spring should be weakened by filing, and the points dressed under the lens, on an oilstone so that the ends are perfectly square and the jaws close parallel, in order that the bead may not jump away. Users of ready made scales should check them by measuring a number of beads and then weighing them all together on a good balance. I have found a Lingke scale 15 per cent too high; probably the dry climate caused it to shrink.

Many assayers denounce the quantitative assay of silver by the blowpipe as worthless; perhaps it is so in their hands, but I have found it useful for rapid approximative work on ore and tailings in milling, and in prospecting it is invaluable, if one has the means of weighing a decigram of ore within one per cent, and such means are easily improvised with a bit of tin sheet, a slip of wood and a couple of needles.

I cannot close this without the remark that Forbes' (?) blowpipe assay of silver, as described in Crooke's edition of Mitchell's Manual of Assaying, differs in no essential respect that I can see from the method taught by Plattner many years earlier.

USE OF ROCK DRILLS.—In speaking of Shaft No. 3 in the Ontario mine, Park City, Utah, now down 1000 feet, the Salt Lake Tribune says: The rock here, as for the last hundred feet, is exceedingly hard quartzite. It would be nearly impossible to sink it at all by hand-drilling. In sinking four machine drills were used and three sinking shafts. It was man contending against nature at all points; in fact, it has been so almost from the very first in the Ontario, but man, directed by intelligence and man possessing nerve and sticking qualities, the net result of the apparent confusion in slauting of drills, hammering and blasting and whatever else made a din, has been peace and dividends with the men who have directed this great work. But it may well seem wonderful to the spectator. Man will dig his hole a thousand feet deep and cut out chambers as big as two story houses in the flint-like rock. He will hold the subterranean geyser at bay and keep the walls of his rock house from crushing him. He will make a dry house down there for his ponderous pumps, and set the power of a thousand horses to lifting water and rock. Then he will burrow out the ores and turn them into money. It is all in knowing how and having the means.

THE CRESCENT CONCENTRATING WORKS.—In 1884 the company constructed a tramway five miles long, to bring the ore down to the sampler and concentrators. The concentrator is located at the lower end of Park City, close to the creek and partly in the bank on the east side. A tramway on that side dumps ore on an ore floor, capable of storing seven or eight thousand tons. Another tramway runs into the mill, where ore is dumped into chutes connecting with a large Blake crusher, from which it passes through screens, the coarser portions going through very large Cornish rolls. The balance of the machinery consists of five screens running from 4 to 40 mesh in size, after which five jigs complete the operation of condensing about five tons into one. The average is exactly four and eight-tenths to one. The concentrator thus obtained go about 50 per cent lead and 26 ounces silver. The machinery is operated by a 50-horse power engine.

MECHANICAL PROGRESS.

The Railway Sleeper Question.

The question of railway sleepers, is constantly increasing in magnitude and importance. Much investigation has taken place, many experiments have been undertaken, and numerous exhaustive reports have been made to furnish the needed data for conclusions, and still the question is an unsolved and a much vexed problem.

The Vast Supply Needed.

Confining our attention to the railways of our own country—the total length of track in the United States is set down in round numbers at 150,000 miles. Assuming the average durability of ties to be seven years, and the distance apart three feet, there will be 2640 to the mile, making the total number in use 396,000,000. Estimating one-seventh to be replaced every year, the annual demand to keep up the present railways will reach 56,571,428. Supposing that an acre will supply 100 ties—a liberal estimate—it will require 565,715 acres annually to furnish the ties required by the existing lines of railways. For each mile of railway there will be an annual demand for 377 ties. It will require 30 years, on an average, for trees to grow large enough for making cross ties. The acres that must be kept in timber and growing will be 16,971,420 for supplying ties to the railway lines now in existence.

The increase in railway mileage, estimated by two decades, is about 4150 miles annually. To construct the railways that will probably be built in the next ten years, 109,560,000 ties will be demanded, the product of 1,095,600 acres of woodland. Allowing 30 years as the period of growth for ties, this would add 3,286,801 acres to the timber reserve for railways alone, making a total of 18,905,579 acres as the needful reserve. Evidently this question is one demanding reach of statesmanship and a careful preservation of our present timber supply.

Relative Value of Woods for Ties.

Elaborate investigations have been made in regard to the relative value of the different kinds of wood for ties—their durability, cost, resistance to pressure, etc. It has been found quite difficult to arrive at conclusions in this regard, from the fact of the great diversity in cost, resistance to pressure and durability—some being very durable but too soft to resist pressure; others being durable, but costly, etc. Cedar is found the most durable, but too soft. The California redwood, all things being considered, seems to stand the best test; but the fact that this wood has been used only on the Pacific Coast, in a dry climate, militates against experiments in this direction being a fair test as against some Eastern woods. Then again, the growth of the redwood is very slow. Fifteen-year-old trees have a diameter of only ten to twelve inches, and such trees will only make three ties, seldom four, and when younger the wood is not durable. It is said that the Santa Cruz redwood is the most desirable, as it is much heavier and denser than the redwoods grown further north. Cypress comes next to redwood in durability, then some of the hardest oaks, pine, chestnut, hemlock, tamarack, elm, ash, etc., in the order named.

A Pleasant Prospect for Ironmasters.

The time is evidently not far distant when one of the largest items in the construction and maintenance of a railroad plant will be its sleepers or cross-ties. The vast acreage, as some set it forth, required for the present supply of wooden ties, and the immensely increasing area which will be called for in the early future, seems to point most unmistakably to the necessity for a change from wood to iron or steel. Stone, for reasons not necessary to discuss here, seems to be ruled out by general consent. The vista which such a change opens up to the ironmasters of the world is beginning to be dilated upon in quite glowing terms, and affords a pleasant prospect to the early future of our iron interests generally. As already intimated, the relative cost of iron or timber is not yet conclusively settled, but the cost of the supply of the former is so constantly declining and that of the latter so regularly increasing, that they must soon meet on a common level and pass on to the advantage of the former.

The Question of Iron or Steel Sleepers

Is much nearer to a practical solution in Europe than in this country, owing to the greater scarcity and higher cost of timber there, as well as the lower cost of iron and steel. There seems to be a very great probability that the railway managers of Great Britain will soon resort to iron or steel. We note progress in this direction as follows:

Iron Sleepers for India.

The Anderson Foundry Company, Glasgow, have received a large order for cast-iron railway sleepers from Calcutta.

The Darlington Iron and Steel Company are laying down a plant for the production of steel sleepers, and they anticipate being soon able to accept orders from English lines. This concern and others who are preparing to enter the sleeper business note with satisfaction that the Belgian Technical Railway Commission has just pronounced in favor of experiments on large scale with steel sleepers. Quite a number of practical experiments with iron sleepers are now in progress on various English railways, and it is claimed that

Yearly One Hundred Thousand Tons

of steel sleepers would be needed upon the railways of the United Kingdom if as many had to be relaid with the metal as have now to be relaid with timber, since the mileage relaid year by year in the three kingdoms is one thousand. To pay for the material now being employed in this work, about a quarter of a million sterling has to be annually sent to Russia, Norway, Sweden and Canada together. The British iron makers are offering great inducements to the railroad companies in the way of low prices, to make the change at once, and they make no secret of the fact that they have out it painfully fine to encourage the railway companies to discard timber. The lumber dealers are also wide-awake in the matter, and are supplying timber sleepers at an almost ruinously low cost. Taking it altogether, the railway people have a prospect of low prices for a long time to come in this important article of maintenance.

Still Experimenting.

It seems that the want of entire success with steel sleepers on some of the English railways has led to the substitution of an article which, it is thought, will meet the deficiencies hitherto experienced. According to the new system, the metallic sleeper is rolled to the requisite trough-like section. Under each rail is a sole plate to strengthen it there. The chair is formed of two jaws made of steel plate, stamped into form and ribbed centrally, so as to give strength to resist the pressure of the wedges. The jaws, sole plate and sleeper are united by rivets passing through the three thicknesses. The iron sleepers that these are intended to take the place of were inefficiently elastic and did not rest sensibly, but, being seriously weakened by the large holes necessitated by the character of the fastenings, and these holes being situated on either side of the rail just where the strain on the sleepers was greatest, the latter were continually breaking there, thus rendering it obvious that the acknowledged advantages of metal sleepers must be realized under an improved system.

NEW MECHANICAL CONSTRUCTIONS.—However correct the original designs of a complicated machine appear on paper, practical experience teaches that small modifications are required in the details, before perfect accuracy of action is secured. Capitalists who engage in the manufacture of, or invest in new devices, and do not take into account the delay and expense due to this cause, find their estimates sadly out of gear. It is seldom that even the simpler mechanical inventions, when essentially different from machinery previously in the market, work to entire satisfaction at once, even if the most skillful designers have made the plans. Many a fabulous profit, expected to be realized already within the first year of the investment in the special mechanical device, is wrecked on this shoal or is at least seriously diminished in its proportions. Of course men of experience always realize this risk, and make some kind of allowance for it; but those who invest wildly in engineering devices, and especially the novices, have their tempers not a little ruffled by this experience, and are too ready to blame the engineers and machinists for what seems, in the nature of things, to be an inevitable accompaniment to the manufacture of essentially new mechanical constructions.—[*American Engineer*.]

MECHANICAL GLASS BLOWING.—Messrs. Appert have devised a process in their factory at Clichy in which they use air stored under great pressure, so as to dispense altogether with the necessity of blowing by the mouth. Glass-blowers are peculiarly susceptible to various disorders, such as diseases of the lips and cheeks, and predisposition to tumors and rupture. These affections are the more serious because boys are often employed, when the system is weakened by rapid growth. The high temperature and dry atmosphere increases the unfavorable hygienic conditions. The new process entirely suppresses blowing by boys, and, with rare exceptions, by adults also. The manufacture of glassware is thus ameliorated by rapidity of execution, as well as by the perfection and the large size of the pieces which are produced.

NAILS FROM OLD STEEL RAILS.—B. Lauth, of Howard, Pa., has patented a method of forming steel nail-plates directly from old steel rails. Old worn-out Bessemer steel rails are rolled down to small sized strip, hoops or nail-plates. These plates are placed in a closed box to protect them from the action of the atmosphere, and are heated in a furnace to a white heat. The furnace fire is then allowed to cool down to permit the gradual cooling of the plates. The plates are said to possess the qualities of ductility and softness to a high degree, and to thus form nails of a superior quality. The plates should not be exposed to the air until they have cooled in the box. If a very high white heat is attained there would be danger of welding the plates together, and such high heat should therefore be avoided.

AMERICAN WHEELS IN ENGLAND.—The recent demand in this country for English horse-cabs has disclosed the fact that the wheels imported there are of American make. Buyers here have actually paid the cost of freight to and from London, and duty on their reimportation of these articles manufactured in their own country.

SCIENTIFIC PROGRESS.

New and Important Discoveries.

Quite recently a large number of new discoveries, some of them of large importance to the arts and industries, have been made through the studies and researches of scientists. First in order, we may mention that of a cheap process for

The Manufacture of Sodium.

The need of some cheap process for the manufacture of this hitherto high priced material has long been felt; and now comes the assurance that that want will soon be supplied. M. Losier, of Lyons, France, announces that he has discovered a cheap means for this manufacture by an electrolytic process, by which he will be enabled to furnish the product at a very low figure—a mere fraction of its present cost. Such a low figure of production will insure a very large demand for the material, especially for use in mining and all other industries where quicksilver is largely employed.

The process of M. Losier, it appears, consists in decomposing chloride of sodium by an electric current at a temperature of 90° Centigrade. It is stated that by this process it requires but three pounds of salt to produce one pound of sodium. The only expense attending the manufacture is the cost of fuel for heating and melting the salt, and the cost of producing the electrical current. The cheapest quality of salt can be employed; hence the manufacture of sodium may be made very cheap at any point where cheap salt and cheap fuel meet. Salt, either rock or marine is absolutely inexhaustible. This discovery will add a new factor to its value as a cheap raw material, and open a new field of research for other possible discoveries of great value to the industries of the world.

The New Hydrogen Manufacture—Water Gas Possibly as Cheap as Natural Gas.

The recent communication of M. Felix Humbert and M. Henry to the French Academy of Science, in regard to the new method of producing pure hydrogen and of making water gas at an extremely low cost, has caused much anxious attention, not only in France, but all over Europe, and in this country as well. If the process which these gentlemen have described marks a new departure in gas-making, the matter is of weighty import, not only to the gas manufacturers, but also to the coal owners and iron masters. It will affect in no inconsiderable degree the consumption of coal, and modify some of the processes of iron manufacture. In this process a jet of superheated steam is directed into a retort filled with incandescent coke. The oxygen unites with the carbon to form carbonic oxide, and hydrogen is liberated. Up to this point there is nothing new in the process. But now these gases are led away to a second retort filled with lumps of some refractory substance maintained at a red heat. The use of refractory materials is to expose a large surface to the incoming gases. Into this second retort there is led at the same time a jet of steam superheated to the point of dissociation. The oxygen of this steam unites upon the carbonic oxide to form dioxide, and more hydrogen is liberated. To remove the carbon dioxide the gases are passed through milk of lime, and the pure hydrogen is led away to the reservoir. The authors of the communication say that one ton of coke produces about 96,000 feet of gas, which is about eleven times the quantity obtained from a ton of coal, which reduces the cost of the gas to a very low figure—very little indeed, it may be supposed, above the cost of natural gas, when the difficulty of controlling that gas is taken into account. It is easy to see the numerous applications of such a gas for heating purposes; but the inventors have arranged to make a start with it for lighting. How the carburation is to be affected is not stated, but it is announced that the little town of Boulogne-sur-Seine is to be lighted with this gas during the winter.

New Source of Citric Acid.

It has recently been ascertained that large quantities of citric acid may be extracted from the fruit of the cranberry, which contains $\frac{1}{3}$ to $\frac{1}{4}$ per cent of the pure acid, accompanied by one-quarter to one-third per cent of malic acid; but the quantity of the latter is said to vary in different localities; and it diminishes as the fruit becomes completely ripe. A certain quantity of malic acid is, however, always present. The manner in which Groeger extracts this acid from the German cranberry is as follows:

The fruit is ground in a mill and pressed to obtain the juice; the residue is treated with water and subjected to pressure three times more. The first operation yields 57 per cent of free acid. The liquids being all united are treated with a solution of gelatine, which precipitates all the tannin. The precipitate is very abundant, but is soon deposited. Having ascertained by a test made upon a small portion of the clear liquid, how much carbonate of lime is required to saturate it, this quantity is added to the whole of the solution decanted (not filtered) from the precipitate of tannate of gelatine. When the entire liquid is perfectly saturated it is heated until it boils. The boiling causes citrate of lime as white as snow to be deposited, and this being collected and stained in the usual manner is decomposed by the action of sulphuric acid at 10 per cent.

In carrying out the latter operation it is also

important to ascertain, by a previous test made upon a small quantity, the exact amount of diluted sulphuric acid requisite to effect the decomposition of the citrate of lime. From 1 to $\frac{1}{4}$ per cent of pure crystallized citric acid can thus be obtained from the fruit of the cranberry. The red coloring matter appears to be entirely got rid of with the tanning, as the citrate of lime precipitated by boiling is perfectly white.

New Process for the Manufacture of Chloroform.

A new process for the manufacture of chloroform has just been patented in this country. It has caused quite a revolution in the trade, and bids fair to place the manufacture of the total annual consumption in the United States, which may be estimated as 300,000 lbs., in the hands of the patentee. Although a number of large firms have been working to obtain the same end, viz., the cheap production of chloroform, it has been the good fortune of a scientific gentleman in Albany to perfect the process, and he will thus reap a large pecuniary reward as the result of much labor and patience. A description of the entire process of the manufacture is before us, but it is too lengthy and technical to be given in these columns.

THE PHONOGRAPH TO BE IMPROVED.—Mr. Edison, the inventor, has resumed work on the phonograph, and is now engaged in perfecting it so that he can bring it into everyday use as is the telephone. Mr. Edison has not given the phonograph any attention since 1878, when he gave himself up wholly to making his electric light invention successful. He is now building a phonograph with a five-foot wheel to be driven by steam. The sound will be transferred from the phonograph to a wheel 40 times its diameter, the sound being thus amplified 40 times louder than the human voice. It will have a funnel 30 feet long. If placed on top of a building, Mr. Edison claims that a person standing two blocks away will be able to hear it talk plainly. He has also got so far as to make the machine say "Ah" distinctly by means of many wave lines.

Mr. Edison said: "After I get this machine perfect I will construct phonographs for office use, to take the place of stenographers and type-writers. All you will have to do will be to hand it to the office boy, who, by touching a spring, can make it repeat or talk back all that you have said to it and transcribe at will. Then again, you can have one at home, and when a thought strikes you all that is necessary is to talk it at the machine, and you have it boxed up for next day. I have no doubt that it will be a great success."

THE SUN'S CORONA.—Signor F. Tacchini, the successor of Signor F. Secchi, at the observatory of the Collegio Romano, has published a confirmation of the astronomer Forel's statement that the sun's corona is, in a clear sky, discernible on high mountains in a very distinct manner. He himself observed the phenomenon from the summit of Etna at the beginning of July. At Rome, Naples, Messina, Catania, the sun appeared surrounded by a broad white crown; but from the top of Etna, 3300 meters above the level of the sea, in a very clear sky it presented the appearance of a white ring surrounded by a splendid copper red corona. Near the horizon, the sun's appearance changed into an ill-defined arch of great span. He was able to observe all these phenomena at leisure on two different days. At sunrise and sunset he saw clearly the beautiful red light of the arch. But he is of the opinion that those appearances are not as strong and brilliant this year as in 1883 and 1884.

EFFECTS OF OIL OF LEMON ON CORK AND ITS PHILOSOPHY.—Corks stoppering bottles or cans containing oil of lemon will become bleached after being in use for some time. Why this occurs is met by the following explanation, which may be of value to consumers: Essentials of the nature of oil of lemon, which are free from oxygen when pure and fresh, are gradually affected by exposure to air, some oxygen being absorbed while a peculiar resin is formed at the same time. Oil of turpentine is a familiar example of this. Oils of orange and lemon undergo this change, and gradually become so altered that they lose their specific odor and require an odor and properties resembling that of common oil or turpentine. This oxidizing action, however, is accompanied by a development of ozone, and it is the latter which bleaches the corks. When the cork of an oil of lemon bottle shows signs of being bleached, it is high time to examine the condition of the oil. It will then probably be on the road to destruction.

EFFECT OF HIGH PRESSURE ON FERMENTATION.—In continuation of previous experiments on the effect of high pressure on low organisms, MM. Cretes and D. Cochard state that the vitality of *tortula* is not destroyed by a pressure of 300 to 400 atmospheres continued for several days. Examination under the microscope shows no perceptible change in the form or appearance of the cells, and when afterwards brought into contact with saccharine solutions they multiply and otherwise behave in a normal way. Under the same pressure alcoholic fermentation always takes place after some time. When fermentation occurs under high pressures, the development of carbonic acid appears to ensue under special conditions of molecular equilibrium.

TABLE OF CONTENTS.

EDITORIALS.—Wheeler's Improved Surface Condenser, 77. Passing Events; Plumas County; Quicksilver Mining in California; Mining in Klamath; Hydraulic Tables; Alaska Mining Notes, 80. Mining Accidents; Ore Roaster; An Oxidizing and Chloridizing Furnace; Mexican Mining Labor, 81.

ILLUSTRATIONS.—Wheeler's Surface Condenser for Marine or Stationary Engines, 77. American Form of Gears for Roasting Kilm; Chloridizing and Desulphurizing Furnace, 81.

CORRESPONDENCE.—Exhaustless Gold Repositories; Measuring Silver Globules, 78.

MECHANICAL PROGRESS.—The Railway Sleeper Question; New Mechanical Constructions; Mechanical Glass Blowers; Nails from Old Steel Rails; American Wheels in England, 79.

SCIENTIFIC PROGRESS.—New and Important Discoveries; The Phonograph to be Improved; The Sun's Corona; Effects of Oil of Lemon on Cork and Its Philosophy; Effect of High Pressure on Fermentation, 79.

USEFUL INFORMATION.—An Enormous Granite Slab; An Ingenious Nut Cracking Machine; A Dead Black Paint; Paper Slippers; Preparing Beeswax; Coloring Marble; Keeping Apples; A New Potato; A "Red Letter" Day, 83.

GOOD HEALTH.—The Cause of and How to Delay Old Age; War on the Skating Rinks; Steam Baths for Diphtheria; The Telephone and Contagious Diseases, 83.

MISCELLANEOUS.—Practical Hydraulics, 82.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 84-5.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 88.

Business Announcements.

Assurance.—H. M. Newhall & Co.
Delinquent Notice.—Pine Tree Mining Co.
Partner Wanted.—Gilbert Clements.

See Advertising Columns.

Passing Events.

The long-continued storm has been a drawback to most operations for a few weeks past, though in some localities the miners have profited by it, in allowing the flowing water to wash the gravel. Of course river-bed mining had to stop when the water rose.

There is so much more now stored in the mountains, that there will be an abundance of water for mining all the coming summer.

The newly-discovered gold district in Southern California is attracting attention, but so far very little is known concerning it that is at all definite.

The region of country down along the lower end of the Carson and Colorado railroad, in Nevada, is being much enlivened by the recent mineral developments thereabouts. It is probable that there will be a good many more men in that part of Nevada in this spring.

Hydraulic Tables.

The series of articles now being published in the MINING AND SCIENTIFIC PRESS on "Practical Hydraulics" contain a great deal of very valuable information for users of water. Mining men particularly will do well to preserve their copies of the PRESS, or purchase the whole in book form. The set of tables given on page 82 this week is specially useful to water users. By these tables any one can tell without mathematical knowledge how much water a pipe of given size will deliver on a given slope. The tables have been worked out from smallest

to largest pipes, and from slight slopes to heavy fall. In the description of the application of the tables the method is plainly given. A great deal of work has been gone over to tabulate this matter, every example having been worked out and proved. They save a great deal of calculation. These tables alone are worth the subscription price of the PRESS, or of the compiled hook form. Miners can use them without the assistance of mathematicians or engineers. They give the velocities and quantities of flow in clean iron pipes due given slopes and diameters, and are very comprehensive and complete.

Plumas County Mines.

Aside from the extensive property of the Plumas-Eureka Company, which has just completed a season's work satisfactorily as usual, the greatest interest in the quartz mines of Plumas county is, at present, centered in the mines near Greenville, at the head of Indian valley. In the large mountain west of the valley, and within a few miles' radius from the town, the principal mines are located. Of those from which ore has been recently or is now being milled with good results, may be mentioned the following: Cherokee, 20 stamps, and hoisting works; Acadia, 10 stamps; New York, 10 stamps; Indian Valley, 24 stamps, and hoisting works; Taylor-Plumas, 10 stamps; Crescent, 18 stamps, and hoisting works; Green Mountain, 92 stamps; making a total of 184 stamps.

There are also several properties in different stages of development from which ore is crushed, from time to time, as custom ore. Altogether, the prospecting done in each mine has demonstrated that the mountain is a mass of quartz veins of wonderful extent; and the various owners are beginning to see the wisdom of combined effort to develop their properties by deep adit tunnels, that will tap the ground at some depth. With this point in view, several claims have been recently combined to form a strong company, and a tunnel is now being pushed to develop all simultaneously. The same plan will undoubtedly be followed in the opening of other claims now soon to be commenced. The natural contour of this quartz district offers much to facilitate this plan of working, for the claims lie close together, the mountain side is very steep, and the supply of water and timber is both accessible and abundant.

In every instance where capital has been wisely applied in developing the mines of this locality to a reasonable depth, the veins have proved permanent and of increasing richness. This has been shown to be eminently the case with the "Indian Valley and Union Consolidated mine," which is now paying handsomely from a point lower than any in the previous history of the mine. This company has spent during the past season over \$50,000 in permanent improvements, among which may be mentioned the addition of power drills, run by water, and new water-power machinery for pumping and hoisting.

The property of the Green Mountain Company pursues the even tenor of its way, its 60-stamp mill being one of the finest in this State. Air drills have been in use at this property for some time past. They are used in the stopes and in the main drift, which is now in over 4000 feet, and is still being pushed ahead.

As if to equip the gold-hunter with all the requirements of his calling, nature has placed on the top of the mountain, far above the mines mentioned, a small valley, which has been converted into a reservoir by the Round Valley Water Company. By means of a ditch around the last slopes of the mountain, water-power is made available for all the mines now developed, or that may be hereafter, the great height affording immense power from a relatively small amount of water.

The result of the last year's work in this district is considered highly satisfactory and encouraging. There has been a generous outlay of capital, in the one instance mentioned, and the results are correspondingly gratifying. Other mines that have been lagging somewhat, from the lack of sufficient capital, are gradually getting into better shape. Business men and property owners have confidence that the dullness of the past two or three years is being shaken off, and are still firm in the belief, often expressed, that the Greenville district is "not half prospected."

Quicksilver Mining in California.

Although quicksilver mining in this State is by no means in as flourishing a condition as it was some years ago, on account of the low price of the product, yet there is considerable production. In 1885 we produced a total of 32,073 flasks of mercury, of 7½ pounds each, against 31,913 flasks in 1884. Of this by far the largest portion came from the New Almaden mine, in Santa Clara county. This mine produced 21,400 flasks in 1885, against 20,000 in 1884.

Other California mines produced as follows in 1885: Etna, 1309 flasks; Napa Consolidated, 2197; Great Western, 3469; Guadalupe, 35; New Idria, 1144; Sulphur Bank, 1296; Redington, 385; Great Eastern, 446; various, 392; total flasks, 10,673. This, adding the 21,400 flasks produced by the New Almaden, makes the grand total 32,073 flasks. The lowest price of the product per flask in the year was \$28.50, and the highest \$32.

The New Almaden mine is quite a remarkable one, and is the most important of the quicksilver mines of the United States. A statement of the earnings, expenses, etc., for 15 years, ending Dec. 31, 1885, under the management of J. B. Randol (to whom we are indebted for these statistics), shows the magnitude of the operations.

Quicksilver produced, 299,522 flasks, average value, \$35.1204.....\$10,529,851 70
Miscellaneous..... 590,521 20

.....\$11,120,372 90

Mining on the Klamath.

Hydraulic mining work on the Klamath river is somewhat different from the conditions in Butte, Plumas, Sierra and Nevada counties. There they are nearer centers of civilization, and have some mail facilities. At Big Bend, up in Humboldt county, the mail only reaches the miners by mule-back occasionally, like the "grab." Everything brought in there is taken in by pack train from Arcata or Eureka, 65 or 80 miles distant, and that only at certain times, for the trail is not always open.

Nevertheless, the Klamath region is the hydraulic miners' country. No complaint can ever be made about debris or other mining ma-

terial from the Klamath river, as it is a canyon from its source nearly to its mouth in Del Norte county. There are many opportunities on this river for mining capital to develop the hydraulic mines, gravel and water awaiting the first comer, but the stranger would hardly know where to look.

The above items were sent us by one of our oldest subscribers, who sends in his subscription for the current year, and says: "I think I have had every number of the MINING AND SCIENTIFIC PRESS from a few months after this first number was issued. I first gave my subscription to our old friend A. C. Kuox, when living in Sacramento in 1865. I had previously taken it from the newsdealers."

Mexican Mining Labor.

Some people suppose that because mining labor is cheap in Mexico, the mines ought to be worked there at greater profit than here. There are, however, many difficulties to overcome. One who has been mining in the United States and is then suddenly transferred to Mexico, having been accustomed to the high wages (and good miners) here, would naturally think that in a country where mining has been active for three centuries, with the low wages of the country it would be an easy matter to make a success of any proposition which the proportionate reduction of wages would, on its face, show an estimated profit.

We had a conversation this week with a gentleman of considerable experience in the country, who has had also several years experience in Mexico. He informs us that he has been forced to this conclusion that cheap labor in Mexico, in nine cases out of ten, is a fallacy. He gave us his reason for this opinion, and as his observations are of general interest, we repeat them:

The average Mexican miner is a creature of custom: so long as he is permitted to carry on his underground work after the manner of his remote prototype, just so long can a high cost of production be counted on.

The principal obstacle to cheap production in Mexico is the tenacity with which the miners adhere to the ancient customs; to break down these barriers of custom is anything but an easy task. Custom is usually as marked in Mexico to-day as it ever was. Just here it may be said that a trip over the Mexican Central railroad does not give one the remotest idea of the actual state of—call it civilization—in Mexico.

The wage earner of to-day is as much a peon as he ever was, and is treated as such. Everything movable about the works is under lock and key, or else the eyes of a guard; coming off the shift the men are systematically searched—dire is the penalty for stealing.

The natural method in handling peon labor (in using the term peon here we refer to that labor under the Spanish regime) was by task work. It is the inheritance of this ancient system that has to-day to be contended with. The labor was all divided, a certain set of men always doing certain work. When the miner drilled the holes, these would be blasted by bosses—for under the Spanish regime peons were not permitted to be the custodians of explosives. After blasting other parties would come in and clean up the waste, etc.

The number of holes to be put in for a shift's work would be governed by the time necessary to remove the waste. This would soon be arrived at for a given district; the cleaning out of the waste would take some little time for it is all packed out on the backs of men. They carry it in raw-hide sacks; a maximum load will be about 200 pounds.

To-day there are districts where two holes—each about half a vara (17 inches) deep constitute a shift's work. These put in and blasted the miner is free to leave; then the peons will come in and clean up.

Where the rock is short so that a blast will not throw down much ground the number of holes will generally be increased. Of course the drilling quality of the ground will be a factor in the matter. Under these conditions working on "day's pay" is out of the question, and the resort must be contract work. Letting the work on contract is only the first step in the right direction. In rock where you would expect the men to advance from 18 to 21 feet per week, the end of the week comes and you find that your breast has only advanced from six to eight feet; investigation will generally show the cause to be poor powder and an adherence to custom in putting in the drill holes.

The black powder of Mexico (*polvora corriente*) compares with black powder such as we are used to in the United States about as our black powder compares with nitro-glycerine powders. This is the key to the 17-inch holes; a deeper hole would be most apt to blow out.

Nitro-glycerine and imported black powders are gradually coming into use; but they are at present expensive.

The old method of putting in holes for blasting was "churning." Two miners would take,

between them, a long iron bar, some two inches in diameter. This would be tipped with steel. They would throw the bar at the point where the hole was desired, after the manner of a hattering ram. This would be kept up until the hole had gained the desired depth. It will readily be seen that this method of putting in holes necessitated the use of long drills. They would be, of necessity, at least three feet longer than the hole. Being long and heavy, it was impossible to give the holes much of a rake.

With powder of little force and holes which were practically straight, the result was a system of plugging; a pot hole would be blasted out in the center of the breast, and this would be enlarged by plug holes until the work was of the required dimensions. The miners of the present day, except where they have been taught better, follow the old method of plugging; hence the slow advance. As a class the miners are hard workers, and the results are not commensurate with the amount of force they expend. Before one can successfully institute reforms, looking to an advancement of the knowledge of the miner, and its consequent financial benefit to the employer, he must thoroughly convince the men with whom he has to deal that he is a master in the art. They will respect power, and in this case knowledge is power. By experience it has been found by our informant that the quickest and most reliable way of bringing about desired changes is to interest the foreman and bosses by talking over the subject and getting them to understand thoroughly how you wish to do a certain thing, and what result you expect.

Having a foreman with ambition (this is the rarest article in Mexico to-day) he will soon begin trying a few little experiments on his own hook. His success will give him confidence. The miners under him will gradually fall in with the new order of things and in a short while the result will be very apparent in the pay roll. Our informant calls to mind an instance where after six months work the pay roll showed that the cost of labor had been reduced on certain work from \$21 to \$10 per meter, the miners earning the same wages (50 cents) per shift. The company was simply getting the benefit of the knowledge that the men had acquired through which they, the men, got an adequate return for the labor expended. The secret was in getting the men to use Giant powder, putting in as deep holes as possible, and, last, but not least, getting the men to put in their holes giving them the necessary "rake" so as to throw down as much ground as possible.

The question will naturally be asked, How do Mexican companies make mining pay? This can be answered in a general way by stating that, as a rule, Mexican companies are not so heavily capitalized as foreign companies. Again, the investment for "plant," with few exceptions, is but a trifle in Mexico as compared with similar investments in the United States; but our informant is convinced that any mine which can show a profit under Mexican management would have this profit greatly increased were the mine manned by a crew of skilled miners.

In metallurgy we can probably take some lessons from the Mexicans, as their knowledge of ores and their treatment is wonderful.

Mining Accidents.

A miner in the Lane mine, at Angels, Calaveras county, was caved on last week and received severe injuries about the head.

A mining accident occurred last week at a mine near Sumersville, Tuolumne county. Two brothers, John and James Quick, were working in the New Albany mine, belonging to John Walker, when they were caved on by a mass of loose rocks. John Quick was almost instantly killed and James badly, but not dangerously, hurt. The dead man had been a mine foreman for several years, and had long been a resident of the county.

A snow slide at Poverty Gulch, near Crested Butte, Colorado, killed three miners named Wm. Alexander, John St. John and Wm. Goss. A recent snowslide killed Robert Corey and Henry Collins.

At Eureka, Nev., on Sunday last, Anthony Copeland, a tributer in the Jackson mine, was discovered at noon hurried beneath an immense cave that occurred the previous morning about 10 o'clock in the drift on the 50 foot level, where he had been working for some time past. Inasmuch as he was missed in the morning by his friends, a search was instituted, that resulted in the discovery of the cave. When found only the head and neck of the unfortunate man remained unburied, and he was not only in an exhausted condition, but unable to move, so tightly was he wedged in. Beef tea was administered, when his strength rallied, and the work of cribbing overhead, to prevent a further falling of the earth, was commenced. This was found necessary, owing to the character of the earth and the dimensions of the cave. After being buried for fifty-two hours, Cope-

land was extricated, but died a few hours after, having received fatal internal injuries.

The body of Jas. Oxnam has been recovered from the Germania mine, Montana, after being under water two weeks. In working in a drift he and a fellow miner tapped a large body of water in an adjoining mine. They had put in a shot, and were on the ladder 25 or 30 feet above the bottom of the shaft waiting for the shot to go off, when they heard the roaring of the water above. They didn't know at first what it meant, but soon the water came pouring down the shaft. Oxnam descended the ladder four or five feet, and leaving it, got into the bucket, which was swinging in the shaft. Anderson remained on the ladder. In a moment or two Oxnam was knocked out off the bucket by the force of the water and fell to the bottom of the shaft. A second afterwards Anderson was struck off the ladder and followed Oxnam to the bottom. He immediately grasped the ladder, and being aided by the rising waters he managed to reach the 150 foot drift, where he was rescued by another miner, but Oxnam was drowned.

Alaska Mining Notes.

The great success attending the milling of the low-grade ore of the big mine on Douglas Island,

AMERICAN FORM OF GJERS ORE ROASTING KILN.

Alaska, is attracting more attention to Alaska mines. The Douglas Island mine is shipping gold bullion regularly, \$74,000 having been sent down this month. The mill has 120 stamps with a full outfit of concentrating machinery, and the ore is being worked at small expense. The mill is run by water power, a Pelton and a Knight hurdy gurdy wheel being used. The ledge from which the ore is obtained is a very wide one, and is in fact a great mass of quartz. The ore is of low grade, however, but there is so much of it that the whole thing is a paying proposition.

It is stated that capitalists are now negotiating to put up another big mill on the Bear's Nest mine, which adjoins the Treadwell mine on the north.

News from the Juneau mines, on the mainland, is to the effect that they have had severe weather of late. These mines are mainly worked in the summer.

From October 1, 1884, to December 1, 1885, a period of fourteen months, the Queen of the Hills at Bellevue, Idaho, made the following output: Total ore and concentrates shipped, sold, 7,273,099 pounds, aggregating 3,639½ tons. The gross value of these ores aggregated \$461,078.98. Out of this amount the company has paid transportation and freight charges aggregating \$134,540.63. This left them net receipts of \$329,538.35.

An Oxidizing and Chloridizing Furnace.

The oxidizing and chloridizing furnaces of John R. Brett, of Oakland, illustrated on this page, presents several new features, and combines a number of important elements in furnace construction. The apparatus is designed for the continuous operation of oxidizing, desulphurizing and chloridizing ores.

It consists of a vertical flue or stack, A, into

Chloridizing and Desulphurizing Furnace.

which the ore in a pulverized condition is fed by any suitable means, and falls downward through the heat and flume, which enter the stack through a passage, B, from the fire-place,

the chamber, L, transverse partitions may be fixed therein, having an open passage around their alternate ends, through which the dust must travel from side to side, as it passes toward the rear of the chamber.

R is a hopper with a passage, S, leading from it into the flue, D, close to the discharge passage, E, and the ore is supplied with salt or chlorine at this point, so that the two enter the cylinder together and are thoroughly mixed by its rotation.

In order to save fine dust from the upper part of the stack, a passage, T, opens from it into the upper part of the dust-chamber, which extends up nearly to the top of the stack at each side. The lower end of the vertical portion of the stack is narrowed at U, in the same manner as the inclined portion is narrowed at its discharge E. The dust-chamber, which may extend up on both sides of the stack, A, has an opening, V, from its upper end into the stack, and as the passages, K and T, are open, while the stack is narrowed and obstructed at E and U, it will be manifest that the draft through the cylinder from the fire, H, will pass through the passage, K, and carry the dust from this part of the apparatus into the dust-chamber, while the draft from the fire at I enters the inclined portion, D, and escapes through the opening, T, carrying the dust from this portion of the apparatus. The dust will settle to the bottom of the chamber, and the heated air and gases of combustion will pass back into the stack through the opening, V, and thus keep up a sufficient draft.

The main features of the furnace are as follows: The self-discharging dust-chamber and automatic return to this cylinder when not sufficiently chloridized. A saving of a large percentage of salt. Saving in weight of cylinder, which is short, as the greater part of the sulphur is eliminated in the stack. There is less volatilization by desulphurizing without salt. A higher percentage of chlorination can be obtained by first desulphurizing, as shown in the report of the Navajo mine, at Tuscarora, Nev. The separate fires give opportunity for perfect control of heat, making it easy to roast the most rebellious ores. By the constant motion of the pulp while being desulphurized there is no danger of matting. The combination of flues and dust chamber makes the construction comparatively cheap, particularly when the mill is placed against steep banks, as only a portion of the upper end of this stack need be made of brick.

Ore Roaster.

We gave last week a brief description of a form of ore roaster, such as is in use at the Colebrook furnaces, Lebanon, Pa. Another American modification of the Gjers kiln is in use at the Norway furnace, Bechtelsville, Pa., and was described before the American Institute of Mining Engineers, by John Birkinbine, of Philadelphia. The engravings herewith show vertical and horizontal sections of the furnace built at Norway. The casing of each roaster is supported by four main brackets or legs, on which the bottom ring-plates and bosh rest. A lining of red brick laid in clay is placed within the casing up to a level with the charging doors, of which there are six. This lining has walled into it a series of poke-holes made with cast-iron frames. The roaster is lined with a hood of wrought iron, and also has a wrought-iron draught stack. A solid base of masonry, octagonal in plan and conical in shape, covered with cast-iron plates, supports a boiler-iron cylinder three feet in diameter, which is placed in the kiln with a view of securing a greater regularity in heating the ore and less liability of clinkering. The bottom ring-plate, to which the shell is riveted, and which sustains the lining, is supported by the lower arm of the four main brackets, and also by tension-rods carried by stirrups on the upper arm of the brackets.

The castings required for the roaster are the main brackets, cone-plates, poke hole frames, bottom ring, small brackets, washers, etc., and aggregate in weight for one roaster about 15,000 pounds. The shoveling plates of one roaster weigh about 6000 pounds. The boiler-iron for shell, cone and draught-stack for one roaster weigh about 16,000 pounds, and the central cylinder adds to this about 1800 pounds. In addition to the above, there will be required for each roaster 700 pounds of bolts, 11,000 red bricks, 1½ tons clay, 10 cubic yards of masonry, and necessary excavation and grading.

The view of these roasters is given as one of the later constructions of this particular type. They are often constructed without any hood or cover above the charging level. Most of them heretofore built have had the bottom ring sustained upon a series of short cast-iron columns. The central cylinder also is not in general use, the bottom cone being ordinarily continued to an apex, and sometimes made to inclose air-flues.

C. From the foot of the vertical flue, an inclined flue, D, extends downward, at a sufficient angle to insure the flow of the ore down to the discharge opening E, which is narrowed, so as to only allow the ore to flow through, the space not being large enough for a current or draft, which would carry off the dust. The cylinder, F, is supported in the usual way upon wheels or rollers, so as to be rotated by suitable machinery, and it stands at a slight angle with a horizontal line, so that as it rotates the ore moves slowly through it and discharges from the end farthest from the inclined flue into a chamber or pit, G. The fireplace, H, at the same end, communicates with the cylinder, and supplies the requisite heat to assist in chloridizing. A fireplace, I, connects by a flue, J, with the lower part of the inclined flue, D, to supply heat at that point. From the end of the cylinder nearest to the flue, D, an inclined passage, K, leads downward into the dust-chamber, L, the bottom of which inclines sharply to a spout or trough, within which a screw conveyor, M, revolves, and carries the dust into a receptacle, N, from which it is lifted by a bucket or other elevator, O, and discharged into a hopper, P. A pipe or passage, Q, reconveys the dust from this hopper, P, into the lower end of the flue, D, in case it has not been completely chloridized. If it is desired to settle the dust more completely within

SAN DIEGO MINES.—A correspondent of the *Los Angeles Herald*, writing from the Julian mining district to San Diego county, says: "The present appearance of this camp indicates a prosperous future. The Owens resumed work on the 4th inst., the superintendent having returned from his trip to San Francisco, where he went to contract for the new quartz mill for the Owens mine, which will have power to run fifteen stamps. The lower level presents a fine body of ore—unequaled by any mine in the State, the face in the tunnel being fully five feet where the glittering metal is plainly discernible. The hoisting works are in splendid condition, and everything in connection with the mine runs gaily. An additional force will soon be put in the stope, and when the mill is erected I have no hesitancy in saying that the first run of quartz from the Owens will be the biggest gold run ever taken out in this district. The San Diego will soon resume work with a new suit, having abandoned the old tunnel. A new one has been sunk, and the precious stuff plainly in sight. No stopping of consequence has been done in this mine, so the mine remains undisturbed."

ENFORCED INDUSTRY.—It was a good old law, no doubt, that as enacted by the General Court of the Massachusetts Bay Colony, in 1655, obliging our ancestors of that time to spin wool, cotton, flax, etc., into yarn for clothing, under a heavy penalty if not complied with. Unemployed women and children were enjoined to spin according to their skill and ability, and the selectmen of every town were ordered to assess every family within their respective jurisdiction with a certain production of yarn per year, at the rate of ninety pounds for a full spinner's work. If such laws were in force now there would be fewer paupers in the country. Bringing up children in idleness is one of the most fearful sources of suffering and crime.

TWELVE HUNDRED TRAINS IN ONE DAY.—On a recent public day in New York, 12,000 trains passed through the Grand Central depot in that city. Trains came and went as fast as they could be handled. The immense transportation work which is done by railroads on special occasions, is made possible by the "block signal" and "interlocking switch" systems. Without such aid, railways would be unable to do anything like the immense business, which of late years is so often thrust upon them. It is only by considering such figures as the above that we can form any adequate idea of the immense advantages and conveniences conferred upon the public by the present improved system of this modern mode of travel.

SALE OF THE PINACATE COAL MINE.—The coal mine at Pinacate has just been sold to Eastern parties for \$150,000. A seven-foot vein was recently discovered, and, on a test being made by experts, the coal was found to be entirely suitable for smelting purposes. On the strength of this test the sale was made. It is supposed that the Atchison Railroad is the real purchaser. This is news of considerable importance, and its accuracy may be relied upon. It adds another and very important one to the list of our country's valuable resources. This mine is near the line of the California Southern, 100 miles from San Diego.—*San Diego Union*.

The strike in the Mayflower mine was the event of Placer county in 1885. When the pay gravel was first reached about the first of July, 600 ounces were taken out the first week, and the report of October 1st to the stockholders showed that exactly 124,000 had been taken out after a ninety days run. The yield has been as constant and steady since then, having been interrupted only a few days by a breakage of machinery. It is fair to assume that about sixty per cent of the yield is net profit. The Mayflower was a hydraulic mine from 1877 to 1883, during which time it turned out about \$25,000; owing to litigation and the high price of water it did not pay.

A USEFUL PUBLICATION.—The venerable Professor Vilanova is about to publish a polyglot dictionary of scientific and technical terms. He will himself prepare only the Spanish and French part of the work, but he expects others will take up and supplement his work, until a cyclopedia of the sciences is produced in which any man can readily find exact statements of the facts in his own language, and their equivalent in all other languages. It is an important work, and the congress and all geologists will doubtless help him to the extent of their power. He secured the endorsement of the work by the International Geological Congress at its last session.

THE DERRIS APPEAL.—In the case of Edward Woodruff vs. the North Bloomfield Mining Company, et al., involving a settlement of the debris question, which has been decided in the Circuit Court in favor of the plaintiff, Judge Sawyer has granted a motion of appeal to the United States Supreme Court, on condition that the defendants should file a bond in the sum of \$500 to pay all costs. The case is an important one, inasmuch as it settles the mining debris dispute. Judgment was given the plaintiff in the Circuit Court, allowing him an injunction and preventing the defendants from hydraulic mining.

USEFUL INFORMATION.

An Enormous Granite Slab.

Probably the largest piece of granite that was ever split by mechanical means, from its position in a quarry, was recently separated from the main ledge in the Flynt granite quarry, in Mounson, Mass. The piece or slab was 354 feet long, 11 feet wide, and from 3 to 4 feet thick. It was separated by the means usually employed in all quarries for separating slabs or blocks from the main ledge. A row of wedges were set, several hundred in number, and the workmen beginning at one end gently and carefully tapped the wedges, moving by degrees down the line until the other end of them was reached, when the same operation was repeated. In this manner, by patient application, the slab of the above phenomenal size was successfully separated from the main rock. The value of this immense slab, if it could have been transferred safely to one of our large cities, at not too great cost, would have been several thousand dollars. And it seemed almost sacrilegious that it was necessary to cut it up into smaller blocks for transportation, and finally used for ordinary building purposes.

In this connection it may be noted that the largest single stone ever shipped by any railroad in this country was recently loaded on a car at the Erie railroad in Jersey City. The stone is for a monument in Buffalo, is 14 feet in diameter, weighs 15 tons, and cost \$5000. The car was prepared especially for the stone; two of the center sills were cut off and braced, and this stone swung down through the floor. The height of the stone when loaded was 15 feet from the track.

AN INGENIOUS NUT CRACKING MACHINE has recently been constructed at St. Louis, intended for cracking pecan nuts, or rather so preparing them that the shells can be readily and rapidly removed by hand, leaving the kernels unbroken. The machine is provided with a hopper into which the nuts are poured and is driven by power. At the bottom of the hopper is a small nut-shaped space, which is opened for or closed against the nuts automatically by a slide. This space is just large enough to admit the nuts singly on end, and centering on it are six knives arranged at equal distances from each other, and so designed that each of them cuts the shell of the nut longitudinally its full length. The knives are held clear of the cutting point by strong springs until the nut has dropped in place, when they are driven forward simultaneously upon it, against the pressure of the springs, by cams on a revolving plate. When the nut is cut it drops through. Girls husk the nuts without trouble after they have passed through the machine; and the kernels are shipped all over the country to be used in the making of candy and for various other purposes. The machine is operated by a company at Austin, Texas, which does an immense business.

A DEAD BLACK PAINT.—The *Locomotive*, issued monthly by the Hartford Steam Boiler and Inspection Company, gives the following receipt for painting brass tubes, and such articles as optical instrument makers produce, a "dead black." The writer says he has found all the formulae and recipes given in the books unsatisfactory because of their vagueness, but that the following can be relied upon to give a first-rate dead black, and it is easily made: Take two grains of lampblack, put it into any smooth, shallow dish, such as a saucer or small butter plate, add a little gold size, and thoroughly mix the two together. Just enough gold size should be used to hold the lampblack together. About three drops of such size as may be had by dipping the point of a lead pencil about half an inch into the gold size, will be found right for the above quantity of lampblack; it should be added a drop at a time, however. After the lampblack and size are thoroughly mixed and worked, add twenty-four drops of turpentine, and again mix and work. It is then ready for use. Apply it thin with a camel's hair brush; and when it is thoroughly dry, the articles will have as fine a dead black as they did when they came from the optician's hands.

PAPER SLIPPERS are the latest form in which paper is introduced. Mr. W. Litchfield, of New Broad Street, London, has patented a system of manufacturing slippers, sandals and other coverings for the feet, out of paper. In carrying out this invention, paper, paper pulp, or papier-mache is employed for the upper, which is molded to the desired form and size, and a sole is provided made of paper or pasteboard, leather-board, or other suitable paper material, which is united to the upper by means of cement, glue, or other adhesive material. The upper is preferably creased, embossed or perforated at the instep and sides, or other parts thereof, so as to prevent the breaking or tearing of the same while in use. The sole may be made with or without a heel, and, if so desired, the slipper, or other foot covering, may be provided with an internal lining of any suitable material.

PREPARING BEESWAX.—In an article on preparing beeswax for market, an English writer says that the great secret of having a neat looking product, lies chiefly in the melting of it. He states that direct heat must not be em-

ployed, but that a water bath must be used, into which the vessel containing the wax must be placed. To clear the melted wax and throw down the little particles of dross that may be present, he adds one drop of sulphuric acid to every 15 pounds of wax.

COLORING MARBLE.—By means of a simple chemical process a beautiful coloring of yellow is now given to marble, without any injurious effect upon the polish or hardness of the stone. Neutral chloride of iron is for this purpose dissolved in 90 per cent of alcohol, and after gently heating the marble to be colored, the solution in question is applied by means of a brush, a sprinkler, or by pouring, the strength of the solution being, of course, proportioned to the depth of the color desired, and care being requisite also in regard to the degree of temperature. On the marble becoming completely dry it is moistened with water or exposed to moist air, when the decomposition of the salt of iron takes place in the upper stratum, and the process of coloration is complete, all that remains to be done being to polish the surface, if necessary, or it may be simply rubbed off with a wet cloth. For light tints very diluted solutions are applied.

KEEPING APPLES.—Mr. S. W. Jewett, writing from Vermont, tells of a method by which he preserved apples fresh and fair for 18 to 20 months. "The system is," Mr. Jewett proceeds, "to take the apples ripe and fresh from the trees at this season of the year and cover them up with dry, fine coalashes, to a depth of 14 to 18 inches. I have apples that have passed two winters thus preserved out of doors, exposed to rain and frost, and yet the fruit came out fresh and fair. How much longer the apples would keep under these circumstances I do not know. Possibly pears, eggs, and some other perishable articles might be kept by this simple and inexpensive process much longer than under present methods. There is no patent on this suggestion, and its simplicity and light cost should induce the experimenting of those who desire to keep fruits for long periods."

A NEW POTATO.—According to the *American Naturalist* we are to have a new kind of potato that will not rot. It is to be a hybrid formed between the common Irish potato and a similar tuber found in the southernmost parts of South America. Next to a roll of fresh dairy butter that has never flirited with the oleaginous portions of the festive porker, the potato that has no decay lurking in its system will occupy the front door of the American household.

A "RED LETTER DAY" means a lucky or auspicious day. The expression was derived from the custom of printing the names of saints' days and holy days in red letters. "Black letter days" signified unlucky days. The Romans marked their lucky days with chalk and the unlucky ones with charcoal.

GOOD HEALTH.

The Cause of and How to Delay Old Age.

A Scientific Discussion of the Question.

The principal characteristics of old age, as demonstrated by anatomical research, are a deposition of fibrinous, gelatinous and earthy material in the system. Every organ of the body, during old age, is especially prone to ossific deposits. The earthy deposits have been found to consist primarily of phosphates and carbonates of lime combined with other calcareous salts.

According to the researches of Dr. Williams, of England, man begins in a gelatinous and ends in an osseous or bony condition. From the cradle to the grave a gradual process of ossification is undoubtedly present, but after passing middle age the ossific tendency becomes more markedly developed, until it finally ushers in senile decrepitude. These earthy deposits during old age materially interfere with the due performance of function by the organs, hence we find imperfect circulation in the aged; the heart gradually becomes ossified, the large blood vessels blocked up with calcareous matter, and nutrition hindered.

A distinguished physiologist says: "If repair was always equal to waste, life would only terminate by accident." And it is the opinion of eminent scientists that the majority of all who pass sixty-five years suffer more or less from these ossific deposits. Therefore, bearing these facts in mind, we plainly see that the real change which produces old age is nothing more or less than a slow but steady accumulation of calcareous matter throughout the system. The idea that old age is brought about simply, or at all, by a decline of the vital principle has long since been discarded by scientists, and the true cause found to be that of gradual disintegration of the tissues because of the inadequate supply of blood. Following out the ideas of Dr. Williams, this process is believed to be of a chemical nature, and the causes being nothing more or less than ossific deposits, let us for a moment look for the causes and influences leading to the condition we have described.

The Two Principal Causes of Old Age

Are, first, fibrinous and gelatinous exudates; and second, calcareous deposits. According to recent researches of Delany Evans, the origin of

the first, may undoubtedly be traced to the destruction of atmospheric oxygen, and demonstrable by the following argument:

In the air we breathe the relative proportion of oxygen to nitrogen is 22 to 78; and although oxygen is in far smaller bulk, yet it is the most active element. Now, oxygen has an affinity for every other element except fluorine; and as oxygen plays by far the most important part in these chemical changes constantly at work in the economy, life itself is but a constant waste by oxidation and reparation by food. In the blood exists albumen and fibrin, themselves resolved into component parts, carbon, hydrogen, nitrogen, oxygen, sulphur and phosphorus. Fibrin, it is claimed, contains one end five tenths more oxygen than albumen. Now, oxygen converts albumen into fibrin, fibrin itself being out an oxide of albumen. Although unquestionably fibrin nourishes the organs of our body, yet it becomes at times, as we reach the cool and shady walks in the evening of life, accumulated in redundant quantity, blocking the streams of life as doth the chilling winds of winter the mountain rivulets. There is always a struggle going on in our bodies between accumulation and elimination, and thus it is that the fibrinous and gelatinous accumulations of old age are chiefly traceable to chemical action of atmospheric oxygen.

The calcareous deposits next claim our attention, being proved by anatomical investigation to be peculiarly characteristic of old age. In the human body water forms 70 per cent of its aggregate weight; in fact, there is not a single tissue but contains water as a necessary ingredient. Now, water holds certain salts in solution, which become more or less deposited, notwithstanding the large proportion eliminated through the secretions, and it is but a question of time before these minute particles deposited by the blood have a marked effect in causing the stiffness and aridity of advanced life. The reason why in early life the deposit of earthy matter or salts is so infinitesimal is simply because they have not had time to accumulate. Besides providing the requisite elements of nutrition, food contains calcareous salts, which being deposited in the arteries, veins and capillaries, become the proximate cause of ossification and old age.

How to Retard These Changes.

Having now traced the primary existence of calcareous matter to food itself, it is consequently a subject of no small moment to ascertain the various dietetic articles containing these salts. As a matter of fact, everything we eat does contain them to a greater or less degree. The cereals are found most rich in them; so bread itself, the so called staff of life, except in great moderation, most assuredly favors the deposition of these salts in the system. The more nitrogenous our food, the greater its percentage of calcareous matter; hence a diet composed principally of fruit, from its lack of nitrogen, is best adapted for preventing or enfeebling ossification.

Moderation in eating must ever be of great value as an agent for retarding the advent of senile decay. Large eaters more rapidly bring on ossific deposits by taking in more than is utilized or excreted, naturally resulting in blocking the vessels and destroying their normal functions. According to the best authority I have been able to consult, the following seem to be the best articles of food; as containing the least earthy salts: Fruit, fish, poultry, flesh of young mutton and beef, because, as before stated, of their being less nitrogenous. Fluids, as part of the diet, are of special import. All well and spring water contains considerable of the earthy salts, and should therefore be avoided, and cistern water used in its stead, because water is the most universal solvent known. Therefore, if, when taken into the system clear of foreign matter, it is to that extent the better prepared to dissolve and take up those earthy salts, and convey them out of the system. The addition of 15 or 20 drops of dilute phosphoric acid to the glass of water, and drank three times a day, will add to the solubility of these earthy salts.

WAR ON THE SKATING RINKS.—Our exchanges speak of a general collapse of the public skating rinks throughout the country. Lately the pulpit, Protestant and Catholic, has been making war on the rinks, where young people of both sexes are thrown promiscuously together at uneconomical hours, without proper guardianship, and form improper acquaintances which often turn out badly. The medical profession opposes the public rink also, where the exercise becomes, when long-continued, injurious to health and limb.

STEAM BATHS FOR DIPHTHERIA.—Dr. Wachs-smuth, of Berlin, recommends the Russian steam bath for diphtheria. The patient at first takes as much warm tea or thinned milk as he can drink. The legs are then put for a long time in hot water, and afterwards rubbed vigorously with the hand. The treatment is varied according to the stage of the disease by hot and cold rubbings and warm drinks. The patient is finally wrapped in woolens, and will recover if he can be made to sweat.

THE TELEPHONE AND CONTAGIOUS DISEASES.—An English company has perfected its arrangements for providing sick chambers with telephones. The object is to give persons suffering from contagious diseases a chance to talk with their friends. Speaking tubes are inadmissible on account of the infectious nature of the breath.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CLEANUP.—Amador Ledger, Jan. 23: The last clean-up at the Gover, made early in the month, was of a very satisfactory character, although we are not able to give the exact yield per ton. The ore-body is said to be over 20 feet wide, and improving in quality. Everything points to the return of the dividend-paying era for this property at no distant day. Captain Theis, a mining expert, is in Amador City, having been sent out from the East in the interest of the stockholders of the Bunker Hill Mining Company. We understand he is highly pleased with the appearance of the mine, and everything pertaining to its management. The mine has a brighter outlook to-day than it has had for years. Mine and mill give employment to about 70 men. At the South Spring Hill matters have quieted down to the regular routine work of mining. The 20-stamp mill is working finely in every part; it is conceded to be as perfect a mill of its size as there is in the State. An air-compressor for underground drilling has been ordered, and is expected up daily. Messrs. Clements & Co. are also fixing up their contrivance for saving the gold-bearing slime from the tailings, believing that it will pay with 20 stamps, although it was unremunerative with a 10-stamp mill. We paid a visit to the Kennedy last Saturday to see the new water-power hoisting machinery in motion. They have now got down to the steady work of baling out water, the machinery being in perfect running order. The shaft is being drained by means of two huge iron buckets, holding 500 gallons each, the empty bucket descending as the full one ascends. These buckets are mounted on flanged wheels which run on iron tracks. When the bucket reaches the surface, the whole frame-work upon which it is suspended is pushed out from the bottom, which carries the bucket clear of the shaft; it is then lowered, the weight of the bucket pressing up a false bottom, and letting out the water. It is one of the simplest and most effective methods of taking out water that we have seen, and reflects credit upon its constructors, Messrs Knight & Co. Water is raised at the rate of about 20,000 gallons per hour. During the first two or three days' work the water level was reduced 45 feet, which gives birth to the hope that the drainage of the mine is not so formidable a task as was anticipated, and that the bottom will be reached in about two months.

Calaveras.

MURPHYS.—Calaveras Citizen, Jan. 21: The starting up of the Ore Plata mill, stamps and pulverizers, on the 1st of the present month marks the era of a new departure in crushing ores, as the Tustin pulverizers arranged for wet crushing have proven to be an entire success. Those who have had the opportunity of witnessing their splendid working are enthusiastic in their praise. The advantages claimed over stamp batteries, are, greater crushing capacity, with less power, more thorough work in reduction, and a larger percentage saved of sulphurets, and the precious metals, and decreased expenditures, as the wear and tear is less. It is the opinion of those who are capable of judging that it is only a question of time when they will displace stamps. Mr. Tustin, the inventor, has been here for a week, taking a deep interest in the alterations from dry to wet crushing, and leaves for San Francisco to-day entirely satisfied with the success of the alterations.

El Dorado.

EAGLE KING.—Pacerville Observer, Jan. 22: John Camp, of the Eagle King mine, near Grizzly Flat, informs us that he is arranging to erect a mill on his mine at an early day. His tunnel is in to a distance of 600 feet, and he has struck a new chute of very rich ore, which has been followed for forty feet at a depth of 100 feet from the surface. The ledge is well defined, and continually widens as greater depth is attained. In a few months more Mr. Camp will reap the reward his energy and perseverance so richly merit.

GREENWOOD.—In years gone by considerable mining was done and large sums of money expended. Several mines are now being worked in the immediate vicinity, and in two or three of them work is being systematically and actively prosecuted; especially is this true of The Revenge mine, located one and a half miles southeast of Greenwood. This mine, under the able and efficient superintendency of F. R. J. Dixon, is keeping up its regular lick night and day, and what is better still, is keeping up its regular dividends. Ten men find steady employment, and are working in ore that speaks well for the permanency of the mine.

STRUCK IT RICH.—Record-Union, Jan. 21: A. Flohr, of this city, and a few others have been engaged for about two years in developing the North Star mine, located about a mile from Shingle Springs. The prospects were at times discouraging, and some members of the company dropped out, but Flohr and three or four others held on. Last Saturday they were rewarded for their persistence by "striking it rich." They have come upon a fine vein of rotten rock, full of free gold. Yesterday Mr. Flohr brought a barley sack full of specimens of the rock down from the mine, and those who looked at it were free to confess that if the rock holds out like the specimens, he has the richest mine in California.

Mariposa.

NEW MILL.—Cor. Mariposa Herald Jan. 20: I have just interviewed R. B. Harper, the experienced and successful mining superintendent of the Red Cloud mine, situated in this county, north of the Merced river, and near Coulterville. Mr. Harper has just bought 2 batteries of 6 stamps each, making 12 stamps in the two batteries. He says that he will have them hauled to the mine, and have them put in place as soon as possible. The company has 10 stamps running at present, but when these additional 12 stamps are in running order, they will have 22 stamps. Mr. Harper says that they have a fine mine. The shaft is down 350 feet, and they have a body of quartz. The vein is 4 feet wide and all good milling ore. Mr. Harper says he will sink the shaft 100 feet deeper, which will give him 450 feet, backs all good ore. He has Thomas Marshall in charge of the mill.

Nevada.

BADGER HILL MINE.—Grass Valley Union, Jan. 23: The Badger Hill Mining Company in its reorganization fixed the number of shares at 50,000, and of these 30,000 were set apart as a working fund to be sold at fifty cents per share, to be paid for in three installments. The remaining 20,000 shares are not to be issued to the original stockholders until all of the installments on the 30,000 shares for working capital have been paid in. This will put the company on a good working basis, and insures a capital that will keep the mining going for about one year, during which time sufficient exploration can be done to open up the resources of the mine by sinking the shaft for another level and running more drifts. Already nearly 20,000 shares of the stock for working capital have been subscribed for, mostly by local residents. There will be as little delay as possible in putting up pumping and hoisting works over the shaft, which are to be run by water-power. The Idaho ditch which is now being rapidly constructed, is to convey the water to the top of the ridge above the mine, and from thence the water will be conveyed to the works a distance of 600 feet, by a pipe line. The water will be under a pressure of 57 feet at the works, which will be sufficient to drive a Pelton wheel to do the hoisting and pumping. The cost of water for power will not exceed \$3 per diem, and the whole surface plant can be put up at a very moderate figure. The present shaft on the mine is down between 170 and 180 feet, where the ledge shows from 18 to 20 inches in size. The mine was never systematically worked in the prospecting that has been done, but the ore taken out gave good returns, such as to justify the development that the new company has determined to make.

A MILL TEST OF QUARTZ.—Foothill Tidings, Jan. 21: A few days ago, Dan. Tuttle hauled over from French Corral which is a hydraulic mining locality, a load of quartz from the Slide mine. The load was nearly but not quite two tons. The mill returns from the load was gold valued at \$34 or \$17 per ton. This return was made by valuing the gold at \$17 50 per ounce, but the gold from the ledge is worth \$19 an ounce. The ore crushed was taken from a depth of about 50 feet. The ledge is some 18 to 20 inches thick. The principal owner is Alex. Dahlberg. The mine is to be opened in a systematic way, and it will give the owners all the money they ought to have if the ledge pays even as low as \$10 a ton. The facilities for taking out ore could not be better, and all the water needed for power is right at the mine.

BADGER HILL.—Grass Valley Union, Jan. 21: The company will proceed to work as soon as the season will permit, by the erection of the necessary hoisting and pumping works. Water will be used as the motive power to run the works and a ditch is now being dug to utilize the water from the Idaho pipe line. The old workings of the Badger mine are several hundred feet in depth, and drifts are opened to some extent, and after the mine is free of water it will not take long for it to produce ore. The company will start with a good working capital.

THE EMPIRE COMPANY'S NEW MILL.—The large new mill building of the Empire Company, which has been in process of erection for some time was covered in last week. There will be room for forty stamps, but at present but twenty will be put up, which will give a head of forty stamps, with the twenty now in use. It is understood that the increased milling facilities are provided because of the determination to bring in water power to cheapen the cost of milling and hoisting.

TOO MUCH WATER.—Grass Valley Union, January 26: The heavy rains of the past week interfered with operations of the Horseshoe mine, as the shaft being near the creek the amount of water required to be handled by the pump kept constantly increasing, and on Saturday the pump, an 8-inch, was just able to hold the water at a given point. The heavy rain on Sunday night, however, increased the flow to such an extent that the pump was submerged yesterday forenoon, and all operations were necessarily suspended. The company will now wait until the rainy season is over before resuming work. Since starting up several months ago the work of sinking below the 100-foot level has been going on for the purpose of opening another level, 45 feet having been put down. A good ledge was showing in the shaft.

Placer.

FOREST HILL.—Cor. Placer Argus, Jan. 21: The superintendent of the Washington mine has commenced sinking a winze in one of the tunnels running off from the main shaft, and at a distance of 500 feet from it. It is now about thirty feet down. The contractors of the Baker Divide tunnel finding steam too costly a motive power wherewith to run their air-compressors, intend soon to erect machinery to be driven by water power. They will erect a thirty-foot water-wheel about 425 feet below the mouth of the tunnel, the power to be transmitted by means of cables, each about 200 feet long, with gearing about midway. It will be no easy matter to do this, as the hillside is very steep. The Live Oak mine is giving a good account of itself. The tunnel is now in about 300 feet. One hundred and twenty-two feet below the level of the tunnel the bedrock was struck last Thursday. It pitches very sharply to the east and south. Superintendent Chappell will sink about fifteen feet more and then he will cut into the gravel. The prospects of the company soon obtaining big pay are extremely flattering. About fifteen men are constantly employed in the mine.

Shasta.

PLACER AND QUARTZ.—Shasta Co. Democrat, Jan. 10: The Squaw creek country, despite the cold, stormy weather, is alive with prospecting parties. The mining outlook in French Gulch district is exceptionally bright. Col. Gannon & Co. will add another mill there soon. Tom Green was in town yesterday, and shipped another chunk of bullion, the cleanup of the last run of 13 tons of ore, which averaged a little over \$50 per ton. Twenty men are at work on the Backbone road from Kennett station to the Squaw creek mines. The road is being pushed through in order to get milling machinery in as soon as possible. Robinson has given up his contract to put up milling machinery on the Scheerer mine. Part of the quartz milling machinery for the Croesus Mining Company, on Squaw creek, consisting of a Westinghouse engine and boiler, etc., arrived the latter part of last week, and will be shipped to the mines in a few days. Col. Gannon, who owns an

interest in the Scorpion mine, at French gulch, informs us that a rich strike was recently made in the lower tunnel of that mine, and preparations are being made to immediately place a mill thereon. The mining future in that district is brighter than ever. Yesterday Col. Gannon, of San Francisco, exhibited at this office a specimen of quartz taken from the old Washington ledge at French gulch, in which Judge Bush owns an interest. This mine has yielded nearly a million dollars in gold since its discovery.

ANOTHER BONANZA.—Courier, Jan. 23: Decker and partners have discovered and are opening up what promises to be another tellurium bonanza. The find is situated at or near the mouth of Bulgin Gulch, and the ledge averages 16 feet in width, and is traceable for several hundred feet. A shaft sunk on the ledge 14 feet in depth shows no diminution of the ore body. The few men in this county who know tellurium when they see it, say that the ore will go into such high working figures that they would not like to hazard their tellurium expert reputation on its real worth. A specimen of the ore, 25 pound in weight, can be seen at G. R. Knox's Mineral Exposition.

SQUAW CREEK.—Redding Free Press, Jan. 26: The Squaw creek mining district is just at present attracting the largest share of public attention. Mr. Jack Bean was up through that country last week, and informs us that all the developments made so far look exceedingly well. The Croesus mine, discovered by Whittion & Small, is now owned by four energetic men, namely—Ollie Whittion, George Bassett, Colonel Stocks and Graupner. Ten men are employed in clearing away for a mill site, and the mill and machinery is expected up daily.

NEW TUNNEL.—Mt. Messenger, Jan. 23: The new tunnel on the Good Hope claim is now in about fifty feet. The South Fork tunnel, at Forest City, is now in 150 feet. One set of timbers is put in by each shift of ten hours.

Tuolumne.

LEASED.—Union Democrat, Jan. 20: The Sell mine located on Bald mountain, which was leased a short time by Johnson & Jones for a period of two years, has passed entirely into the control of Mr. Johnson as sole lessee; he has purchased the interest of Jones for the sum of five hundred dollars. The mine is looking well and promises to be paying property.

San Bernardino.

THE NEW GOLD FIELDS.—Cor. Calico Print: The new gold find in ledges in Arrow mining district at the south end of Providence, is creating quite a stir in mining circles since it has become known that the statements published in the Print were not overestimated. The claims which have had any work done on them, are showing up much better than anticipated. In my letter to you two weeks ago, I stated that some ore was being shipped to Kingman sampling works. I have seen the returns and will give them to you exactly. The Mexicans shipped nine and a half tons, the assay results being five ounces in gold and five and one-third ounces in silver. A company of miners shipped two lots of ores as a working test from the Golden Queen, giving returns of five and three-tenths ounces of gold and eleven ounces of silver in one instance and the other four and three-tenths ounces in gold and five and eight-tenths ounces in silver per ton. These figures speak for themselves. The main ledge of the camp which now has 11 locations on it and on which little or no work has been done is now being prospected by one of the owners on the Red Cloud claim. There has been a body of ore struck which shows in sight from 500 to 1000 tons of ore. So far the assays range from \$40 to \$100; none of the ore assaying less than \$40. The main ledge is well defined and although not much of an expert myself, I could walk on the croppings of the ledge for the whole length of the 11 claims. There are a number of smaller veins being prospected by old miners, which are opening up well. A new wagon road is being laid out from Fenner station on the A. & P. R. R. direct to the mines. It is supposed to be only 20 miles from that place to the district.

THE MESCAL MINE.—The Cambria mine of Mescal about 35 miles north of here has been bonded by Los Angeles parties from McFarlane & Barrett, for 100 days. I did not ascertain the amount of bond. The parties bonding start up the works on the 1st of February. The mine is said to be richer as it goes down.

NEEDLE NOTES.—Cor. Calico Print, Jan. 22: Since my last communication there has been quite a stir among the denizens of our quiet burgh, all about some old locations near Goff's station, 23 miles west of the Needles. It is certain that a good many claims which were located there some three or four years ago, have recently been relocated, the old locations having expired by limitation of law there, on or before the 1st of Jan., 1886. The rock is silver bearing, and judging from the "indications" there is some good ore there, but whether in quantity or quality to pay for the shipment is the problem for solution in the near future. Mr. Heise, of this place, is arranging to ship a carload to the mill in Kingman, to test the value of the ore in his mine. Other parties are simply awaiting the result of this shipment before making expensive outfits to prospect their claims.

There has been some ore shipped from the rich mines near the old camp called Providence, which passed through here a day or two ago, that will run way up into the thousands of dollars per ton. This was from Arrowhead district, 16 miles from Providence.

Trinity.

BULLYCHOOP.—Trinity Journal, Jan. 23: To Mr. W. C. Davis, who was in town this week, we are indebted for the following from the Bullychoop district: The Pound Cake (of which Mr. Davis is a part owner) is still as prosperous as ever, and producing bullion right along—all the clean up having been most satisfactory. They are at present down 160 feet on the lode, which will run from 6 to 7 feet in width. They have a 5-stamp mill, and it is the intention to add five more stamps in the spring; also to double their force in the mine. The Red Bluff Company have three lodes which show up remarkably well, and the company have recently purchased a steam mill, concentrator and rock breaker, which will be hauled to the district and erected before long. On the Central, Titus & Grant have a force of men running a tunnel night and day and expect to tap the ledge shortly. Other mines in the district look bright and encouraging and some new discoveries

have been made. Recently quite an extensive ledge was found on Jerusalem creek by a man named Wagoner, which prospects flatteringly, and he has sold a half interest in the "find" to a San Francisco party for \$1000. There are now three mills there—Pound Cake, Little Gem and Central, the Red Bluff mill not yet being planted. Bullychoop, so our informant says, is attracting considerable attention, and will have quite a boom the coming spring and summer.

DEADWOOD.—Ike Diener has leased the Last Chance mine from the Brown Bear Company and running at present a fifty foot tunnel to tap the ledge. Good ore was at one time found in this mine but was not followed to any extent for some reason. George Van Matre has purchased an interest in the West-lake mine and is extracting splendid ore. Francis Balleau has struck a very rich and promising ledge in his lower tunnel. The ore is rich in galena sulphurets which assays into the hundreds. Wm. Blagrove has found the east extension of his mine which shines with the "yaller truck." Good clean-ups are continually the result of this mine. Lamb & Co. have struck it big in their lower tunnel. This mine is leased from the Brown Bear Co. George Hahn is opening on a ledge, in which Jake Paulsen is interested, that prospects well. The ledge is large and gives evidence of permanence. It is also rumored that lower tunnels will be soon run to tap the Brown Bear and Barted mines, and thus will Deadwood be alive next spring. C. J. Blakemore, on Jennings Gulch, has struck his ledge in the lower level which proves as good as in former days. The ore has been given an arastra test and works over \$700 per ton.

NEVADA.

Washoe District.

GOULD AND CURRY.—Virginia Enterprise, Jan. 23: At the Osborn shaft, owned jointly by this company and the Best and Belcher, the ponderous hoisting works were started into operation again on Sunday last, after a rest of nearly a year. The machinery worked smoothly and well. The shaft was found to be in better condition than was anticipated. The timbers have to be eas-d in places and the lagging renewed. The tank on the 1600 level was found to be so badly decayed that a new one is being constructed in its place. The main pumps are all right as far down as the 1800 level, and the water was found to have risen in the shaft to a point 63 feet below that level. After the repairs to the shaft are completed the water will be reduced by means of a donkey pump sufficiently to reach the pumps on the 2000 level, after which the powerful pump engine in the surface works will be started into operation. The shaft being 2700 feet deep, 837 feet of water will have to be pumped out before bottom is reached, after which sinking deeper will be in order, the objective point being to sink to a level corresponding with the 3200 of the Combination shaft.

HALE AND NORCROSS.—The principal work is concentrated in sinking the deep winze below the 3100 level. It is now down 68 feet below that level, following the dip or inclination of the ledge, with its bottom or face in dry vein matter, carrying strata and bunches of good ore. Very good progress is being made in sinking the winze, and it will reach the 3200 level at least as soon as the Combination shaft will. The bulkhead constructed jointly by this and the Chollar mine on the 2800 level to stop the heavy flow of water from the southward was completed yesterday. It is a massive piece of stone work, well constructed, and after a few days' rest in order to let the cement harden, it will be closed, when no more water is expected to flow from that quarter.

CHOLLAR.—The tank station below the 3100 level at the Combination shaft will be completed tomorrow. The material for the tank is all framed, cut and ready, and it will be put in place in very short order. The Cornish pump will be lowered to that point during the coming week, after which sinking the main shaft will be resumed. As stated in our last report, the bottom of the shaft is now 55 feet below the 3100 level.

OPHIR.—The west drift on the 300 level, from the Mexican shaft has been advanced 49 feet from the station. This drift, being but just started, has not got into the true merits of the ledge as yet. On the 700 level the drift to the northwest, run conjointly with the Mexican and Union companies, is making good progress, as described under the Union Consolidated head.

CON. CALIFORNIA AND VIRGINIA.—About 300 tons per day has been the average output of ore during the past week, giving an average assay of about \$17 per ton. The drift being run to the northwest on the 1650 level, toward the old bonanza ore stopes, is now in 483 feet, and making excellent progress in good working ground.

CROWN POINT.—About 400 tons has been the general daily average ore yield from this mine and the Belcher, which works through it, but owing to the severe storm impeding transportation to the mills, the production has fallen off somewhat, and less miners are employed.

UNION CONSOLIDATED.—The east crosscut on the 500 level is now in 520 feet, with no change in material since last week's report. On the 700 level the joint Mexican and Union drift running northwest from the Ophir shaft has been extended 47 feet, making a total of 168 feet.

MEXICAN.—The lateral drift north from the east crosscut is now in 362 feet, 22 feet having been added to its length during the week. The progress of the joint Mexican and Union drift on the 700 level is described in the Union Consolidated portion of this report.

YELLOW JACKET.—The old ore stopes and breasts are holding out and promising finely, but owing to the heavy snow impeding transportation, there is somewhat of a falling off in the daily output of ore from the mine.

SIERRA NEVADA.—On the 520 level the north lateral drift has been advanced 43 feet, making a total length of 1547 feet. Material in the face vein porphyry, with streaks of decomposed quartz and clay.

ALTA.—On the 700 level the lateral drift north toward the Benton ground is making good progress in good working vein material, showing occasional streaks and bunches of low-grade ore.

KENTUCK.—The usual amount of ore continues to be extracted from the old upper levels, with some

pediment to transportation to the mills on account of the storm.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, Jan. 23: Ore shipments to the two reduction works in town during the past week have not been either large or numerous, owing partly to the bad condition of the roads and partly to the fact that in a number of the properties of the district that are worked on a limited scale "dead" work is being done preparatory to new prospecting explorations to be inaugurated during the early spring months. The following shipments were made in the time mentioned to the Eureka Co. works: Lone Pine mine, 1½ tons; Curtis & Killen, 2½; Dunderberg, 75, and Marguerita 8½. To the Richmond works: Mohawk mine, 3½; May, 4; Morning Star, 7, and Seventy-six 5.

Cottonwood Canyon District.

NICKEL MINE SOLD.—*Silver State*, January 23: George Lovelock, the irrepressible prospector, has sold his nickel and cobalt mines in Cottonwood Canyon to an English company. The consideration is \$35,000, a part of which has been paid. It is the intention of the purchasers to work the mines extensively and reduce the ore on the ground, as nit pine wood for fuel is abundant in the vicinity of the mines.

Galena District.

SALE.—*Virginia Enterprise*, Jan. 23: J. A. Blosson has sold his chloride mine at Galena to an Eastern company, who propose erecting a thirty-ton furnace and in other ways improving the property.

Hawthorne District.

PAMICO.—*Carson Tribune*, January 23: Very cheering news comes daily from the new bonanza county. The Pamico mine, a new discovery near the Lapanta, is showing up grandly; from silver the ore has turned to rich gold, and in the Dictator, Jim Yerington's discovery, they have a five-foot ledge, the ore from which assays \$135 to the ton. Numbers of mining experts are visiting the new district, and a report comes that parties are desirous of bonding the Dictator.

Reese River District.

AUSTIN MINING MATTERS.—*Virginia Enterprise*, Jan. 23: The last weekly report of Superintendent Melville Curtis, of the Manhattan mines, Austin, is as follows: During the past week the mill has reduced 270 tons and 120 pounds of ore, of the assay value of \$58,430.62. At the Lander shaft the tribute stops on the 650, 700 and 740 levels show no particular change. More ground is being opened on the 740 level, some of which shows very good ore. At the Paxton incline the 950, 1441 and 1500 stops continue to produce about the same amount of ore, though of lower grade. At the Union shaft the east stop on the 200 level carries a ledge of very good ore, which increases in grade as the stop is worked up. The 200 shaft crosscut has cut another ledge in the face, which shows a large formation, with bunches of good ore. Drifts are being opened preparatory to prospecting the ledge. The following men have been employed during the past week. Surface men on day's pay, 55; miners on lease, 45; miners on tribute, 123; miners on contract, 6; miners on day's pay, 11; total, 223.

Taylor District.

AN IMPORTANT MINING SALE.—*Eureka Sentinel*, Jan. 23: The Monitor mine and mill at Taylor, White Pine county, was sold yesterday to the Eberhardt Mining Company, the English capitalists who have operated largely in Hamilton for the past 16 years. The owners and the original locators of the mine were State Senator Briggs, W. G. Lyons and W. N. McGill, and the one who consummated the sale for the Englishmen was Capt. Frank Drake. The consideration has not been made known, but it is believed to be at least \$200,000.

ARIZONA.

THE VULTURE.—*Prescott Courier*, Jan. 19: The Vulture mine, with its mill and all other belongings, has passed into the possession, by sheriff's sale, of Mrs. Jeony Elmore, whose husband, for some time past, has been working the mine on lease. The judgments against the Central Arizona Company, the New York incorporation owning the mines, amounted to \$30,000. Mr. Elmore bought them up, pressed them to a sale, and now, the time for redemption having expired, is sole owner. Although the New York Company were unable to make the mine pay, Mr. Elmore has been very successful since he has been a lessee. He has now interested some of the Comstock bonanza people, and work on a largely increased scale is about to be undertaken. For many years the old Vulture has poured out a steady stream of gold bullion, and although dividends on the company's stock have been long out of date, a large body of men has had steady work, and officials have enjoyed good salaries. Eight years ago Vulture shares were held at \$15, for some time past they have been quoted at just that number of cents. Under new and competent management, the mine will prove a second bonanza to its owners, who are pretty certain to recoup on the Hassayampa all the losses they have sustained at the Quijotas.

The latest news from the Sterling mill and mine, shows that the company is having a quiet but continuous success. For some time past the mill has been crushing about twenty-six tons every twenty-four hours. The ore averages from \$13 to \$14 a ton, milling value, and the net profits after meeting both mining and millage expenses, average \$50 per day. Eight men are now employed in the mine. A large quantity of ore is in sight, and the output could be doubled at once, if the capacity of the mill were such as to require it.

Engineer Wilton is in from the Callen properties, on lower Walnut Grove. He reports that a large body of water is flowing through the Hassayampa down there, and that placer miners in that vicinity are very busy. On his way in, he passed by the Oro Fino camp, where that company's dam has been put in. The water there is overflowing, and many millions of gallons are now in store, ready for the company's use as soon as they can arrange their internal troubles.

LOST BASIN.—*Montana Miner*, January 22: Mr. Luthy returned last Monday from Lost Basin, and brings good news. The Ida mine has struck very rich rock, carrying quantities of free gold. Dansby & Co. have put a force of six men on their mine a mile distant, which bids fair to compete with the Ida

in richness. Beecher's team is still out there, hauling ore from the mine to the mill. The new mill is not in perfect running order yet, as some of the machinery is defective, but experiments will continue until it works satisfactorily, and Lost Basin district bids fair to soon rank among the first camps in the county.

COLORADO.

REWORKING OLD MINES.—*Idaho Springs News*, Jan. 21: Histories of mines are always interesting. The Seven-Twenty mine on Seaton mountain is owned by Mr. B. T. Wells, an old Gilpin county man but now of Denver. Years ago this property paid well, but of late years considerable money has been spent by Mr. Wells with not very encouraging returns. The mine has been dormant for a long time. Mr. J. A. Curtis, who lately took a lease and a bond, put men to work cleaning up and taking out the water. About a month's mining has been done and 16 men working. The number of tons of ore shipped would hardly be believed, but nearly \$3000 has been taken out in less than a month, and the mine looks better every day. Mr. Curtis is a tenderfoot, and the mine has always been worked by old miners who "knew it all," and more, too. The ore vein was not run upon by the other parties; in some places they actually timbered in the richest streak of ore. The pay streak averages from four to ten inches and nets from \$100 to \$500 per ton. Mr. Wells has had several hundred dollars in royalty already. How many more mines are there in the district lying idle to-day from this very same cause?

ORE.—*Georgetown Courier*, Jan. 21: On the 60-foot level of the Nynza mine, on Democrat mountain, a vein of solid ore has been exposed, ranging from 3 to 4 inches in thickness, which according to the last mill-run yields 552 ounces silver to the ton. The stock of the Freeland Mining company was listed in the New York market on the 6th, and the first sale made at \$2. The company paid dividend No. 6, of ten cents a share, or \$20,000, on Friday last. This made a total of \$80,000 during the past year. The ore business at Idaho Springs is said to be flourishing, in spite of the mild winter and the dullness supposed to prevail immediately after the new year. The Idaho Sampling and Concentrating works are reported to be shipping an average of a carload per day, with the other mills and mines to hear from. George Dunaway & Co., lessees on the Argentine lode, Leavenworth Mt., are reported to have encountered four feet of ore, of excellent grade. The Bonanza tunnel, which, after running a long distance, recently intersected the Fred Rogers lode, has crossed to the upper wall, and drifting on the vein is now in progress, with encouraging results. The Seven-Twenty lode, Seaton Mt., is being worked under lease by J. Curtis, who has 16 men employed. Work at cleaning out the water from the shaft has been completed and the lessee has from four to ten inches of ore to work upon, which mills from \$100 to \$500 to the ton. It is claimed nearly \$5,000 worth of ore has been taken out in the past four weeks. The owner of the Cosmos group of mines on Saxon Mountain, is steadily opening up his lodes by means of the Cosmos and other tunnels. The Antelope lode, on Sherman mountain, is looking better in the upper workings. The vein of ore exposed is from two to five inches in thickness, and will mill run in the neighborhood of 500 ounces silver to the ton. The lower workings show a streak about one inch in thickness, which will mill from 130 to 500 ounces silver.

IDAHO.

BANNER.—*Statesman*, Jan. 21: The Banner mine is looking well with plenty of good ore in sight. Since the shaft was sunk last fall the mill has crushed 845 tons of ore, producing \$121,000. They have been stopping since the mill shut down and have now about 300 tons of ore out just as good as they crushed last summer, and this work will be continued until the middle of February, when the shaft will be sunk another hundred feet; this will make the Banner mine have a 400-foot shaft. The Silver Chief mine, under the superintendency of James Monroe is making splendid progress. He is putting down a two-compartment shaft which is now down 150 feet; and will be sunk down 100 feet more; when they will run levels east and west and make ready for stoping in the spring. The Payette mine is looking well. Hon. James White is running a tunnel in one of these claims he ran across a well-defined body of ore about one foot wide. Last but not least are the Silver district mines, twenty miles from here and by far the richest looking mines in the country. Therefore a wagon road will be a very essential thing for this section.

DEADWOOD DISTRICT.—*Idaho Messenger*, Jan. 16: Our old time friends, Sam'l Boone and Jack Sheridan, who are very thorough and skilled in the prospecting work, have, with five other parties, been exploring the ranges from Sawtooth mountains to the old Deadwood placers, and even beyond to the west, and altogether have made 26 locations, which they are satisfied will prove rich. They organized a new district which they named Deadwood. Their main locations are about 40 miles south of west of the old Cape Horn house. The ores are silver and gold without any smelting ores associated—silver predominating, and all is milling, the gold free-milling. Messrs. Boone & Sheridan made 13 locations, of which 11 are silver and two are gold. They located five in the immediate vicinity of old Deadwood, two about six miles west, and six other lying six miles east, or towards Cape Horn. The five other gentlemen in this new field, who were exploring in the same region, made 13 locations; 12 silver and one gold—mostly in the vicinity of old Deadwood. There have been made between 80 and 90 assays of the silver ores of these locations, resulting in an average of 65 ounces, and ranging from 35 to 400 ounces. The silver is in sulphide and chloride form. Messrs. Boone and Sheridan visited Challis, and Mr. B. gave us the items of this new region. His opinion is that the new field will be rich and lasting, although it is a matter of judgment, as little development work has been done.

THE WASHINGTON.—*Idaho Statesman*, Jan. 21: This mine is situated on Quartz gulch a quarter of a mile above the town of Atlanta and is the property of Judge J. D. Heath. Mr. Heath was once an owner in the Last Chance mine and has been engaged in mining in that camp for the last 20 years. The At-

lanta, Tahoma, Last Chance, and in fact all the famous mines of Atlanta, are situated on Quartz gulch, from a quarter to a mile and a half above the Washington ledge. Two tunnels are started into the mine. The tunnel crosses the ledge 25 feet from wall to wall and then runs on the ledge northeasterly 35 feet. On the last 35 feet Judge Heath has taken out 100 tons of rock which he now has at the mouth of his tunnel. It is gold ore, carries sulphurets of gold and will require roasting before it is worked, but has no rebellious ores and will work very near its assay value under the roasting process. Judge Heath says that the average of the ore from the full width of the ledge is \$100 to \$150 per ton in gold and only \$4 in silver. He intends to run this tunnel thirty-five feet further when he hopes to strike a chimney that has been prospected from the top and shows very rich gold ore. He will then be 250 feet from the surface following the dip of the ledge.

Judge Heath has two other leads on which he keeps up the representative work, but this Washington is the best developed and Mr. Heath intends to have several hundred tons of ore crushed as soon as he gets to work in the spring. The mine would yield ore sufficient to keep a 20-stamp mill running for years.

MONTANA.

BANNOCK NOTES.—*Cor. Inter-Mountain*, Jan. 23: O'Leary & Gallagher, owners of the Kent mine, Blue Wing district, are working eight men on a high grade ore body, and have cut about fifty tons ready for shipment. The Polaris mine, Lost Cloud district, shipped upwards of \$35,000 worth of ore in 1885, and is now working sixteen men and shipping two carloads of ore per week to Omaha. A new boiler has been added to the former power. Sinking the shaft 100 feet deeper will commence in a few days. About 90 tons of good milling ore valued at \$30 per ton lies on the dump. Frank Williams & Co. have out over 30 tons of ore at the Simpson mine, Elk Horn district, which is being hauled to Red Rock for shipment. It is reported that Carhart's mine and mill, near Marysville, will soon be started up again. Considerable prospecting for gold is being done along Grasshopper creek this winter. I learn that placer mining will be started here in the spring. The bed of this stream has never been prospected, except in two or three places in all of which gold was found and good results may be looked for.

BUTTE MINES.—*Inter-Mountain*, Jan. 20: The recent cold weather has naturally decreased the activity of mining affairs, especially among the smaller mines; but as this is merely temporary it cannot be justly said that the outlook is less favorable than at any time during the month. The principal mines of the district are working as usual with no marked changes to record save a few exceptions where delay has arisen from breakages in machinery. A 20-horse power engine has been put in place on the "Nettie" mine, which joins "Burlington" on the east, and work has begun. The Union Consolidated has ordered timbers for sinking two hundred feet deeper. Work will begin at once. The Lexington shaft is still being sunk to reach the one thousand foot level. The main shaft is now 430 feet deep. During the last thirty-four days this mine produced 9,205 tons of ore averaging 12 per cent copper, and a small amount of silver, per ton. The mine is looking well in the lower workings. About 130 men find employment here when the mine is being worked. The Parrot company has now also some 200 men at their smelter. The Anaconda company thinks, no doubt justly, that their affairs are their affairs and not the public's—but "a cat may look at a king" and at least draw a fine conclusion. With this for a safeguard, we venture to say, from all we can hear and see, that their regular remarkable production has not recently decreased. Everything appears as usual, and there has been no appreciable decrease in the number of men employed.

The North Star will, so it is said, soon be working again. The ore will probably go to the Dexter mill. No change of importance at the Moulton nor at Clark's Colusa. Every thing is reported in a satisfactory condition. The Bell smelter is reducing daily from 35 to 40 tons of Liquidator concentrates, which yield about twenty tons of matte. The Butte City sampling mill has felt the effect of the cold weather somewhat in its usual receipts of ore. This mill offers an excellent chance for the miner to get a perfectly fair sample of his ore, have his assays made at public offices, and sell to the highest bidder.

NEW MEXICO.

MILL AND SMELTER.—*Silver City Enterprise*, Jan. 15: The Meritt stamp mill, near Socorro, is again in operation. A smelter is one of the contemplated enterprises for Hanover district. Platt McDonald shipped 16 tons of ore from the Black Hawk mine yesterday. The ore will average about \$250 per ton. Word from the East says that there is still some probability of a mill being erected to work the ores of the Gold Hill mines. Alex. McGregor is doing considerable development work on one of his promising mines in Hanover gulch. Steve Upton is in charge. Eaton and Caples this week shipped their first carload of ore from the Willis mine. It is principally a lead carbonate and will give the shipper handsome returns for their labor. Work is being resumed on the Sumner group of mines in the Bald mountain district. There is a fair showing of good ore, and the present operator hopes to make the property produce profitably. The bullion production of the three principal Tombstone companies, for the year 1885, is as follows: Grand Central, \$638,077.63; Contention, \$206,173.87; Tombstone Mill and Mining company, \$432,044. The machinery for the McGregor mill will arrive at Deming

in a few days. The boiler has already arrived and is in place. The mill will be in charge of John Spiller, who has been connected with the Mimbrès mill for several years. Jack Clark, an old Georgetown miner, has struck it rich in Sabinal. P. O. Towor and Mike Hughes, of Georgetown, are "in" on the strike, which is said to rank next to the Mose Stevens bonanza, the one that first gave the camp notoriety in this section. Information from Carlisle is to the effect that the company's mine has been paying handsomely for the last three months, and that the future for the camp is very bright. The east camp is soon to have a five-stamp mill. As soon as the Apache troubles are ended good times may again be looked for over there. The new strike in the Merrimac mine in Stein's pass is turning out all that was expected of it, and will prove a bonanza to the owners.

OREGON.

THE MILL.—*Oregon Sentinel*, Jan. 20: Mr. L. D. Brown, of Portland, arrived here Thursday, to select a site for the new quartz mill to be erected here. Some of the mill has arrived, and a portion of the timbers have also been finished. Mr. Brown thinks our roads are so bad at the present time that not enough quartz could be hauled to the mill if it were in operation now, and this has been the main cause of not shipping the mill. It will be run as a custom mill, for a time at least, and Mr. Brown says as wind alone will not run it he must watch every turn to make it a success.

QUARTZ AND PLACER.—*Jacksonville Times*, Jan. 22: Wagner creek expects to have a quartz mill in the near future. The miners have considerable water now, and are making the most of it. Some excellent quartz is being taken out of several ledges in Southern Oregon. The disagreeable weather of the past week has temporarily checked prospectors. The rains of the past week have afforded a large amount of water, over which the miners rejoice greatly. Simmons, Ennis & Co.'s huge mining enterprise, near Waldo, is moving ahead in fine style, and the great cut is steadily growing larger. Ragdale & Co., of the Fort Lane district have been working steadily, and have a considerable amount of quartz on the dump, which prospects well. This general prospecting of Jackson and Josephine counties is certain to result in much good, as several parties will no doubt strike very rich quartz ledges. The Wagner creek region is said to be plastered over with location notices, so busy have the prospectors been. Some good quartz mines exist there. Reports reach us that some very rich rock is being taken out in the Blackwell district, some of which is being pounded up in a mortar and yields extraordinarily well. Josephine county miners are generally busy having plenty of water. That section is one of the best mining camps on the coast and only lacks development to prove its great richness. The Jacksonville Mining Company have three men at work running a tunnel to strike the old Bowden ledge at a favorable place. The reduction work at Medford have been started up again, after a suspension of sometime to permit the putting in of five stamps, a new concentrator and other machinery. Supt. Chick assures us that the best of work will be done henceforth. D. P. Thompson and other Portland capitalists are about starting reduction works at the metropolis on a large scale. Messrs. Kocher and Brant of the O. & C. R. R., who paid this section a visit recently, seem to be satisfied that Southern Oregon will prove one of its very best customers. The Sterling mine has been running continuously for some time past and an eight months' season seems well nigh assured, as a great deal of snow has already fallen at the head of the ditch. Operations are kept up day and night, excepting that no work was done after dark during the cold spell. We are informed that Henry Klippel and Tbos. Chavner will build a mill in the vicinity of Gold Hill for the purpose of working over the tailings coming from their ledge in early days.

UTAH.

STAR DISTRICT.—*Pioche Record*, Jan. 20: It has been the prevailing idea that the mining operations over in Star district, Utah, had proven a failure, but such is not the case. An organization has been lately formed in Salt Lake City, with M. Cullen, A. G. Campbell, Dennis Ryan, J. E. Dooley, H. T. Duke and W. C. Hall as stockholders, and is known as the Star Mining Company, to work mines in the Star mining district. With those millionaires as its backing, and all practical miners, the Star Company starts out with brilliant luster.

THE CHRISTY CO.—*Southern Utah Times*, Jan. 22: There has been no developments of note made in the California during the past week, except that there has been considerable improvement in the grade of ore in the stops on the 400 south. The ore body in the drift north, at a point nearly 20 feet from the uprise above the 250-foot level in the new shaft, has opened out to a width of three feet. The ore is black and high grade in quality. The mine furnished an average of 10 tons per day to the mill during the week. The mill has been crushing an average of 40 tons of ore daily during the week, and, notwithstanding the severe weather which struck this section of late, the stamps have not been hung up for a moment. This speaks well for the present management.

THE STORMONT CO.—Work has been resumed in the face of the main incline in the Buckeye & Savage. It is now down 695 feet from the surface. The ore streak continues to the bottom of the incline, and the ledge matter is similar to that in the old workings which carries the ore bodies. The River Mill was shut down last Saturday on account of the stormy weather having rendered the roads so soft that the teams could not haul ore from the mines. A full force has been kept on at the mines, however, and the regular quota of ore has been hoisted.

OTHER NOTES.—There is a rumor current in mining circles here to the effect that the property of the Christy Co. will be sold to a syndicate of California capitalists in the near future. A party up from St. George reports that 11 feet of 66 per cent copper ore was lately struck in one of the Apex Company's mines, and that an attempt will be made to induce the company to resume active operations on the property. Last year, some private parties extracted \$7000 worth of ore from the mine in a short time, and it is thought that with the advance price of copper and with proper management, it can be made to pay well.

STURTEVANT MILL.

This Mill as a Crusher and Pulverizer is without rival.
Is in operation in leading smelting works and mills.

Manufacturers of

MINING MACHINERY, ENGINES, BOILERS, Etc.

We are manufacturing from Special Designs of the most experienced and successful Practical and Scientific Experts, Complete Plants for all descriptions of Mining Operations, as follows:

CONCENTRATING MACHINERY—Best and Cheapest, Cornish Rolls, all Steel Wearing Parts, Most Practical Styles of Two, Three and Four Compartment Double and Single Jigs, Sizing Screens, Patent Hydraulic Separators, Tables and Concentrators.

STAMP MILLS for Reduction of Gold and Silver Ores, whether free milling or base. Most useful and substantial styles of Single and Double Discharge Mortars, Wet or Dry Crushing.

STEEL SHOES AND DIES, Tappets and Cams, cheapest and best Blake Improved Rock Crushers and Automatic Ore Feeders, Superior Amalgamating Pans with wood or iron sides.

PANS FOR TREATING GOLD ONLY, Settlers, Clean-Up Pans, Retorts, Furnaces, Dump Cars, Hoisting Machinery, Cages, Landing Dogs, etc.

CORLISS, MEYER'S CUT-OFF AND BALL'S PATENT VALVE Engines of extra strength and durability.

STEEL BOILERS of Two Sheets only, Steel Economic Boilers, combining with the safety, durability and economy of the Stationary Boiler, the convenience and portability of the Portable. It occupies but little space, and is the best and cheapest boiler ever made.

WE ALSO MANUFACTURE SAW MILL MACHINERY.

We are also Sole Agents for the Gordon and Maxwell Steam Pumping Machinery, and carry a full stock of all kinds of Mill Supplies, including the

Albany Lubricating Compound and Oils.

Centrifugal Roller Quartz Mill.

F. A. HUNTINGTON,

MANUFACTURER OF

Centrifugal Roller Quartz Mills, CONCENTRATORS AND ORE CRUSHERS,

Mining Machinery of Every Description,

Steam Engines and Shingle Machines.

SEND FOR CIRCULAR.

No. 45 FREMONT STREET, - - SAN FRANCISCO, CAL.

ORE CRUSHER.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE, which contains 94 per cent of Nitro-Glycerine, and **GELATINE-DYNAMITE**, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

AN EXTRAORDINARY RAZOR

HAS BEEN INVENTED BY THE QUEEN'S OWN COMPANY, of England. The edge and body is so THIN and FLEXIBLE AS NEVER TO REQUIRE GRINDING and hardly ever setting. It slides over the face like a piece of velvet, making shaving quite a luxury. It is CREATING A GREAT EXCITEMENT in Europe, among the experts, who pronounce it PERFECTION. Two dollars in buffalo handle; \$3 in ivory. Every razor, to be genuine, must bear on the reverse side the name of NATHAN JOSEPH, 641 Clay street, San Francisco, the only place in the United States where they are obtained. Trade supplied; sent by mail 10c, extra, or C. O. D.

PATENT LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning
and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

T. E. JEWELL, Sole Agent,
330 Pine St. (Room 4) San Francisco.

Send for Descriptive Circulars containing Testimonials of well-known parties who are at present using them.

Chicago Prices Beaten!

S. F. PIONEER SCREEN WORKS,

221 & 223 First St., cor. Tehama, S. F.

J. W. QUICK, Prop'r.

Sheet Metals of all kinds perforated for Flour and Rice Mills, Grain and Malt Driers, Furnaces, Chases, Cement and Spout Mills, Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Inventor and manufacturer of the celebrated Slot Cut and Slot Punched Screens. Mining Screens a Specialty, from 1 to 15 (five).

Orders Promptly Executed.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

BONITA S. M. Co., Jan. 24.—Capital stock, 10,000,000. Directors—James J. E. Hawkins, N. Messer, Joseph Marks, Joseph Bernhard, Charles Hirschfeld.

WEST COAST OIL Co., Jan. 24.—Capital stock, \$1,120,000. Directors—Willard B. Farwell, H. C. Wilson, J. N. Hall, George L. Brown, Charles A. Warren, George D. Nagle and Frank D. Culver.

TULARE LAKE AND KINGS RIVER CANAL Co., Jan. 24.—Object, to carry on irrigation projects in various counties of the State. Capital stock, \$3,000,000, in 600,000 shares. Directors—George L. Brown, H. C. Wilson, Calvin Brown, J. H. Miller and J. P. Jenkins.

HILDBRETH MINING Co. January 18.—Location Fresno county, capital stock, \$10,000,000. Directors—Thos. Hildreth, J. P. Sargent, Adam Herold, E. A. Davidson and John Sevenoaks.

GILROY G. MINING Co. January 19.—Location Butte and Plumas counties. Capital stock, \$10,000,000. Directors—J. P. Sargent, Samuel Rea, E. A. Davidson, Adam Herold and George Seaman.

THE SELBY SMELTING AND LEAD COMPANY has filed a notice of the increase of its capital stock from \$200,000, divided into 2000 shares, to \$600,000, divided into 6000 shares.

Meetings and Elections.

SAN FRANCISCO COPPER Co., Jan. 27.—M. A. De Leveja, P. W. Ames, R. E. Doyle, E. J. Le Breton, Antoine Borel. W. C. Reveal was re-appointed superintendent, and R. H. Pond, secretary.

BELCHER SILVER MINING Co., Jan. 27.—Directors—Jas. Newlands, A. K. P. Harmon, J. H. Dobinson, J. P. Martin and Geo. D. Edwards. At the organization of the directors, Jas. Newlands was elected president, A. K. P. Harmon, vice-president, John Crockett secretary and S. L. Jones superintendent. Cash on hand, Jan. 1, 1886, \$2,787.82.

BADGER HILL MINING Co.—This Nevada Co. mining company has completed its re-organization by the election of a board of directors and officers. The directors chosen were Edward Coleman, Peter Johnston, Denis Meagher, Jno. F. Kidder and Alfonso Morehouse. Edward Coleman was elected president of the company, Peter Johnston treasurer, and Henry B. Johnston secretary.

MARYLAND MINING Co., Jan. 24.—Directors—S. P. Dorsey, John C. Coleman, Edward Coleman, Samuel Bethell, Stephen Moore. President and superintendent, S. P. Dorsey; treasurer and secretary, Samuel Bethell.

Mining Share Market.

The transactions in mining shares seem to be growing smaller and smaller and the prices realized are about in the same condition. Notwithstanding the exploratory prospecting work on the Comstock, and the hopeful feeling there, the market here is not at all buoyed up. The supply of water for driving the big hydraulic pump is now unlimited, and it is doing excellent and very effective work. Sinking the deep winze below the 3100 level of Hale & Norcross goes steadily ahead, and good bunches of ore are still met with. The preparations for sinking the Osbiston shaft of the Gould & Curry and Best & Belcher Companies are actively being promoted. The ponderous machinery of the hoisting works at the shaft was started into operation on Sunday last, after a rest of about a year, and started off all right. On Sunday steam was turned into the cylinders of the pump-engine on the surface of the Osbiston shaft and the ponderous machinery tested. It made several revolutions and moved smoothly, turning over without a jar. The donkey pumps were started at the water level and have cleared the second line of pumps below the Suto tunnel level. The main pump engine on the surface was set in motion and the work of draining the shaft begun. It will require until March 1st to drain it to the bottom, or 2500-foot level, according to a careful estimate of the volume to be lifted to the Suto tunnel level.

Bullion Shipments.

Con. Virginia and California, January 24. \$52,077; Argus, 17, \$4514; Koebig's mill, 24, \$450; Lexington, 18, 20,080; Moulton, 18, \$55,760; Silver Bow, 18, \$20,304; Moulton, 22, \$11,968; Alice, 22, \$22,224; Germania, 21, \$2884; Hanauer, 21, \$3240; Germania, 22, \$3565; Hanauer, 22, \$5400; Crescent, 22, \$3300; Germania, 24, \$2933; Crescent, 23, \$2900; Hanauer, 24, \$2700; Germania, 26, \$5073; Alice, 26, \$5826; Hanauer, 26, \$6350; Stormont, 26, \$2500; Queen of the Hills, 26, \$1100. The banks of Salt Lake City report the receipt for the week ending January 20th, inclusive, of \$2,048.27 in bullion and \$38,410 in ore, a total of \$40,458.27.

CAUTION! Purchase your spectacles from C. Muller, 135 Montgomery St., near Bush. x

E. C. McNEIL, of Austin, has shown the *Reveille* some fine specimens of both gold and galena ores, just brought in from mines owned by himself and others in the Carson and Colorado section. These mines are in range with the Lapanta discoveries, twenty-two miles distant. The gold is free and can be seen in the specimens.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in Dewey & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING JANUARY 19, 1886.

- 334,634.—OINTMENT—Berry & Butler, S. F.
 334,516.—GATE—Depp & Selby, Marysville, Cal.
 334,650.—SKYLIGHT—Jos. F. Forde, S. F.
 334,651.—SKYLIGHT—Jos. F. Forde, S. F.
 334,525.—DIAL FOR TIME PIECES—A. O. Gott, S. F.
 334,600.—DAMPER REGULATOR—McDonald & Townsend, Portland, Or.
 334,601.—DAMPER REGULATOR—McDonald & Townsend, Portland, Or.
 334,539.—OINTMENT—Musgrave & Barton, Oak Bar, Cal.
 334,675.—CIRCULAR ORE STAMP BATTERY—A. B. Paul, S. F.
 334,467.—NECKSCARF—S. Popper, S. F.
 334,547.—SHAFT COUPLING—John Richards, S. F.
 334,739.—SAW JOINTER—C. Schoch, Truckee, Cal.
 334,622.—TOY THEATRE—J. W. Sherman, S. F.
 334,486.—FRUIT PICKER—Strong & Smith, S. F.
 NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SKYLIGHT.—J. F. Forde, S. F. No. 334,651. Dated Jan. 19, 1886. This improvement in skylights consists of one having a ridge ventilator connected with it, and openings and passages for the purpose of ventilation, with certain details of construction.

SKYLIGHT.—J. F. Forde, S. F. No. 334,650. Dated Jan. 19, 1886. This consists in a novel construction of the channeled bars by which the glass is held, air-passages for ventilating purposes and to equalize the temperature, stops for retaining the glass in place, and in certain details of construction.

OINTMENT.—Mark Musgrave and Henry J. Barton, Oak Bar. No. 334,539. Dated Jan. 19, 1886. This relates to the class of ointments for healing purposes, and is intended for chronic or old and mortified wounds, burns, scalds, etc. The ointment is self-cleansing and no water is used.

SPRAY NOZZLE.—E. J. Delaney, San Jose. No. 334,110. Dated Jan. 12, 1886. This spray nozzle is especially useful for the application of washes to plants, trees, or vines which may be infested with vermin. It consists of a tap having a discharge opening or hole made through it, one side of the tip being cut away to a line central with the opening and intersecting its end.

APPLE PARSER, SLICER, AND CORER.—Wm. McMillan, Husleton, Butte Co. No. 334,130. Dated Jan. 16, 1886. This is a parser, corer and slicer of that class in which a carriage carrying the knives for paring and slicing is advanced against and past a rotating apple, which is afterwards removed independently of its core by a swinging arm, said core also being discharged. The object is to provide a machine capable of doing more work in less time than those commonly in use.

JOINT-MARKING AND DRESSING TOOL FOR CEMENT PAVEMENTS.—Malcolm Macdonald, Oakland. No. 334,125. Dated January 12, 1886. This is a new and useful tool or implement for marking and dressing the joints of cement or artificial stone surfaces or pavements. The invention consists of a suitably handled tool having a peculiar central cutting or indenting rib or blade, and a laterally or transversely concave surface or face on each side of said rib or blade, the whole face of the tool being rounded or convex in the direction of its length. The tool is adapted to readily form the division joints, leaving them with round or convex sides and edges, and is also adapted to dress or polish the surfaces of the joints and the surfaces contiguous thereto.

CAR BRAKE.—Wm. H. Masterman, of Newark, Alameda Co. Assignor of one-sixth to A. H. Walker, Oakland. No. 333,874. Dated, Jan. 5, 1886. This device is intended for equalizing or regulating the pressure of brake-shoes upon the wheels of the cars, by which the pressure is prevented from becoming so excessive as to entirely stop the wheels, and thus ruin them by wearing them flat in spots. It consists of a bell-crane lever pivoted to the upper end of the brake-lever having one arm connected with the rod by which the power is applied, and the other carrying a weight which allows pressure to be applied to the brake to a certain point, when this weight will rise. By means of an arm connected with it and provided by an eye, which slides upon a stationary rod, a further movement of the brake is checked by the hindering of this eye upon the rod.

The concentrator recently set up at the Brunswick mill is said to have proved a success and will reduce the cost of milling low grade quartz on the upper levels of the Comstock in which gold predominates, to \$1 per ton.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

THE Eureka Consolidated mine has paid 25 dividends, aggregating \$4,817,000; the Richmond 99, aggregating \$3,177,387; the Jackson—comparatively a virgin mine—7, aggregating \$35,000. These three properties are on Ruby hill, and adjoin one another.

Testing and Working Silver Ores

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of sublimated steam, preparation of dichloride of copper and protodichloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Piche's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican "Chilian process," Kroll's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Nole's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, circulating the ore, direct for filling a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 252 Market St.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

ASSESSMENT NOTICE.

Pine Tree Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Summit Mining District, Kern County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 22d day of December, 1885, an Assessment (No. 1) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 4 (second floor), 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 27th day of January, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 15th day of February, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Sec'y.

Dewey & Co.'s Scientific Press
Patent Agency:

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

GOLD MINES

AND
Mining in California.

The new book with above title is one in which all gold miners will be interested. It describes the Quartz, Hydraulic, Drift and Placer Mining Methods, and progress and improvements made in the BUSINESS OF GOLD MINING in California. It is a grand field for the profitable investment of capital. The AUSFEROUS REGIONS are described, each County being separately treated, and the mines producing bullion or in course of development are referred to. The appliances in use are described. Those who wish to know how and where gold mining is carried on in California, want this book.

Price, \$1.50, sent by mail, postage paid, on receipt of price.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over
other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossi-
ble to make them tight except by regrounding, which is expensive if done by hand, and if don-
by machine soon wears out the valve, and in most cases they have to be dis- connected from
the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is
manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited.
To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

"TRIUMPH" ORE CONCENTRATOR.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$199.15, or \$8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners. This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, flouted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St.,

San Francisco, Ca

1850. 1885.
RANKIN, BRAYTON & CO.,
...BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnaces CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ore DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all the AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than its COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

SEND FOR CIRCULAR.

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.
BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.
E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short life of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

WILLIAM H. TAYLOR, President.

R. S. MOORE, Superintendent.

L. R. MEAD, Secretary.

THE Silver King Company of Arizona are contemplating the addition of a large lot of new machinery to their reduction works.

CORRESPONDENCE.

We admit, nnendorsed, opinions of correspondents.—Eos.

Virginia City, Nevada.—No. 1.

A General Review of the Great Bonanza Camp. Its Marvelous History. Will it Repeat Itself?

(By our Special Correspondent.)

Whilst driving along in our buggy, between old Fort Churchill and Carson City on the 24th day of Dec., last, the following incident occurred to the writer: Forcing our little steed to a steady and rapid gait, down over a long and even grade of some ten miles extent, we sought to make as soon as possible, the base of the opposite mountain, which now lifted itself in bold relief to our front. Raising our eyes suddenly, and running them along the comb of the distant range they encountered an object that appeared both impressive and surprising. Directly before us to the north, full twenty-five miles away, and some two thousand feet above the intervening plain, in distinct and full view, sat a queenly city, enthroned in her majestic mountain home. All unexpected and unheralded this city of silver temples came forth to greet us for the first time: a city wherein the engineering gods are wont to grind exceeding loud as well as exceeding slow, and fine, that silvery grist that feeds the man of commerce. It was a rare and strange meeting to us. Had we been poetical, we certainly should have dictated a few lines of verse for such an occasion as this. As it was, we felt in some measure as if we had met an old friend, who, in the calm sunlight of that remote landscape, had come forth from behind a mountain to show her smiling face. Especially might we imagine this when we were so well acquainted with a namesake and a daughter of hers, who once so kindly furnished a home and protection for us among the golden placers of Montana, in 1863. On the sun-scorched plains of New Mexico and Arizona, we had often met those deceitful atmospheric illusions, wherein towering cities floated in mid-air by the mysterious mirage, are prone to tantalize the weary traveler: but yonder, high up among the crazy peaks, gazing down from her sublime heights, could be seen a real, living city, where the mirage had become materialized, as it were, into permanent, abiding form, and where the wildest dreams of fancy could meet and find a literal fulfillment. Assuredly this was a spectacle far surpassing the famous visions of Mirza. For this city, although poised amid the clouds of heaven, justly claimed and possessed a real and substantial life, that richly adorns the home, peoples the busy marts of trade and crowds the sacred temples of worship. Yes, indeed, with her well-earned fame, that has been borne to every shore and isle of the civilized earth, there lay before us the widely known and celebrated

Bonanza City of Virginia.

Were not this first introduction so striking and unique in its order, we should still firmly believe that a place so largely historic from its bewildering output of the precious metals, could claim and would retain with no small degree of strength the gravest thoughts of the most reflective minds.

The inquiries that would naturally arise from contemplating such a city as Virginia would be:

- (1.) What is comprehended in her present sphere of activity as a mineral camp, and
- (2.) What is to be her coming destiny as such?

If the sphere of merit is proportioned to the extent of usefulness, then may Virginia City be found like Abou Ben-Adem's name of old, to rank the highest among the honored and enrolled of her compatriot sisters, and be found leading all the rest of her silvery train on these Pacific shores. Certainly, in her primeval reign, she holds the prestige of having moved the wheels of commerce and controlled the fortunes and destinies of humanity with greater force and results than any other given spot of earth so limited on the American continent. To many her

Queenly Days of Prosperity

And renown appear to have vanished forever, whilst to many others who claim to have closely and carefully scanned the more recent operations brought to hear upon the ancient Comstock lode, there comes forth to them from these lower depths an oracular voice, more distinct and intelligible than the whisperings of a Delphic sybil, and a sure word of prophecy, which it is said these subterranean argonauts are fully competent to interpret. This interpretation is declared to read thus: "In due season this dismasted bonanza craft will once more sail out of these ports, and bearing onward in a prosperous course, under favoring gales and beneath balmy skies, will once more come into a full possession of the golden and silver fleece, that has so long courted the most earnest and sanguine expectations of all on board."

That Virginia Became Discrowned,

And fell suddenly from her once exalted position, wherein she enriched a multitude of bonanza kings, now mostly fled and scattered over the face of the earth, is a fact too patent to be questioned, but that she will soon return again

in full force, to a legitimate and steady output of bullion, after having been so hastily drained and rifled of countless millions, a few years since, is the most serious and momentous question of the hour. Not being able to solve these problems with any degree of certainty, and wholly unprepared, and quite as unwilling, to write up or write down a camp of this or of any other magnitude, we prefer to give to the readers of the MINING AND SCIENTIFIC PRESS a few brief statements of our personal exploration and review of the principal and various developments of the Virginia mines.

These statements will only partake of the character of a review, and will not presume to entrench upon the details of daily reports or the minutiae of new and constant improvements going forward in and about these mines.

Before proceeding on the path of our explorations, however, it would be very much in place, at this time, to recognize the great weight of our obligation and indebtedness to this noble company of

Owners, Superintendents, Foremen,

As well as numerous toilers at the engine, shaft and drill with whom it has been our good fortune to come in contact whilst engaged in this work.

And, before leaving this point, it may as well be stated, once for all, that during our interviews, with the principal officers and operators, and some of the owners of mines in this camp, no greater expressions of courtesy and hospitality could have been shown than were tendered the writer in his effort to secure whatever information might be of value, or of interest to the public: whilst in some instances owners and superintendents have most willingly volunteered their individual services, and proffered their personal presence in going down into these wonderful shafts, and assisting to explore the labyrinthian depths of this silver mountain.

For all such generous and whole-souled courtesies and hospitalities, your correspondent herewith returns his sincere and grateful thanks. Some of these parties we shall necessarily mention as we pass along in the current of our review. For, as we have before stated, a review is all that is intended in the limited space which we have assigned to our work here, and the pressure of other duties of a business character, has necessarily rendered our work, even in this particular, of a very imperfect nature. Such a review will only include some of the more noted, active and producing mines now enlisting public attention at home and abroad, as to their present condition and future outcome. With an acquaintance of several years in the gold and silver districts of Montana, a two-years' residence at Tombstone, Arizona, and some delightful interviews with the Central City and Leadville ores, we confess to having entered upon our task bere with feelings somewhat akin to that experienced by the youth on "general muster" occasion, in the years of Lang Syne. The

Gould & Curry and Consolidated California and Virginia.

The first objects of our attention, are neighbors to each other, and occupy the more northerly portions of Virginia City. They are now operated in confederation, with several other valuable mines but of lesser note, lying adjacent to these remarkable bonanzas. This most useful coalition of these mines has been established in order to carry forward the work of prospecting, and exploring the territories adjoining, and beneath the old bonanza, more effectively and successfully, than could be accomplished by any one single-handed effort. Whilst this work of prospecting is advancing, all the hoisting machinery in the C. & C. and the Con. Virginia is being worked to its utmost capacity, to deliver ore from the lower levels for milling purposes. The quality of this ore, as can be seen at the dumps, is of such a grade as to justify all the wear and tear involved, and to warrant the stress put forth in some extra efforts. It was the pleasure and good fortune of the writer, through the courtesy of Mr. Lyman, superintendent of the Gould & Curry, as well as through the invitation of Mr. Patton, superintendent of the C. & C. and Virginia, to descend and explore one of these mines at its most interesting and productive levels. This was the C. & C. mine and the examination and inspection took place on the 1750 and 1650 foot levels below ground. We would remind all who may enjoy the pleasure of following our footsteps, that they will meet with an officer in charge, above ground, in the person of Mr. J. B. Shaw who blends all the choicer qualities of a gentleman with the genial refinement of a well posted scholar.

In the Explorations Below,

We had the guidance of the underground foreman, who has been with the work in this mine for over 20 years, and who, now, in his advancing age, can look back over his work, and realize that he has shuffled out, from these nether depths, more bullion into the public coffers, than most bankers have ever passed over the counter in silver dollars, in the same space of time. We trust that no anti bimetallics will take exception to our comparison; for we are now engaged mostly in discussing the production of silver. Whilst our noble-minded escort did not claim to possess all the varied accomplishments of the poet Virgil, whose sacred spirit so kindly conducted his friend Dante through the deep caverns and shades of hell, yet we venture the opinion, that his footsteps and meanderings were quite as well timed, and

measured, as that ancient and worthy bard. It was very pleasant to observe how freely and familiarly he "trod these ancient halls" (not alone, for the writer felt inclined to follow his wake very closely) and what an extensive and intimate knowledge he possessed of all the bearings and workings of this once magnificent bonanza. After landing on the 1750 level we passed on and through the various drifts that radiate from this portion of the mine until we came to a new shaft sunk some 80 feet in depth at the terminal point of one of them. From this shaft ore of a very fair quality was being removed, with an improving indication of something very much better. Our course from this prospect shaft lay through long and angular horizontal drifts that trended more directly toward the principal sphere of operations in the Con. Virginia. After penetrating some hundreds of feet in that direction, we were requested to halt and listen. Our ears were saluted with a regular succession of thuds that appeared to emanate from some remote region above us. The foreman stated that these sounds were caused in working a brace of diamond drills by air pressure, and that if agreeable we would ascend to the 1650-foot level, where they were operated, and also take some circuit around the shell of the great bonanza from which a principal portion of the ore now extracted from this mine is taken. After ascending to the next level (1650) by an ingeniously contrived stairway set in the solid masonry of the mountains, we soon found ourselves in the presence of the drill-masters, who were engaged in

Cutting a New Drift

To the Con. Virginia. In passing around and through these drifts that encompass the base of the old bonanza, we had occasion to observe that some of the timbers, although thickly placed both vertically and horizontally to resist the tremendous pressure from the down-giving weight of material above, were snapped asunder in the middle, others crushed in at the ends, and the whole sides, at times, careened over eight or ten inches out of perpendicular for some distance. These massive timbers were 12 and 14 inches in diameter and barely 6 feet in length. To obtain such an exhibit of stress and strength of material one would have to descend about 2000 feet, as in this instance, beneath a mountain.

We should have but one solitary objection to these drifts and that we fear, in time, would increase in strength, provided we were appointed daily patroler to take in the circuit, and to learn how they were getting along. Our nerves are not the most shaky, but we should enter a stout protest against being provided with a sepulchre 2000 feet under the earth, even though 1,000,000 bonanzas, were piled up as a monument over us. However we should speak well of the bridge that carries us safely over. And as our guide took it all in as a matter of course, so did we. He stated that repairs were constantly going on among these timbers, old broken ones being taken out and larger, new ones being replaced.

Indeed, abundant proof of his statement could be seen in piles of mashed, broken and splintered timbers, at nearly every angle and turn of each drift, all gathered and heaped ready for removal.

In the various horizontal drifts that we traversed around this mountain of timber, that fills up the vast cavity out of which the old bonanza ore was taken, we met with numerous parties of miners engaged in taking out ore for the mills. These were mostly at work cutting into the external rim of the old bonanza, and taking out, in most instances, some of the richest silver ore that it has been our pleasure to see for many a day. Indeed, so hurried and forced was the ore formerly taken by millions from this C. & C. bonanza that there is no certainty in stating what yet remains in this recklessly butchered mineral wealth. We have some samples, now before us, taken from 1650 level, as we passed among the scores of miners, that are exceeding rich. And there appears to anyone taking in the prospect and review below, untold millions of bullion still ungathered in this mine. We came up feeling ourselves stronger, better and somewhat wiser, we trust, for having gone down. We enjoy looking at cabinets of precious ore. Here is one that will make the eyes of the old professor in mineralogy shed tears of gratitude and thanksgiving at the sight thereof.

An ejectment suit has been begun in the Superior Court of Nevada county, entitled Francis Hunt vs. Frank Seates et al.—five miners who are working a hydraulic mine on the premises of Hunt, twelve miles east of Wheatland. The mine is located on the ranch of Mr. Hunt, and is worked by the hydraulic process. The land was purchased from the railroad company by Hunt, the patent of which contains a mineral reservation, under which the miners claim a right to prosecute mining. This case will test the validity of that right. The mine is a small one, and can only be worked in the winter time when the water is plenty.

THE MINING AND SCIENTIFIC PRESS, Dewey & Co., Publishers, San Francisco, has lately entered its fifty-second volume. It is standard authority on all mining interests, and should, as it does, receive the encouragement and support of our miners. The price of subscription per year is low to suit the times—\$3, when paid in advance. Now is the time to subscribe for the New Year to secure the premiums.—*Mountain Messenger* (Downieville).

Mineral Lodes.

A Very Important Mining Decision.

The famous Tintic mining case, in Utah, which has been on trial many weeks, was decided by Judge Powers, in January. The case was entitled, "The Bullion, Beck and Champion Mining Company vs. the Eureka Hill Mining Company." A great amount of expert testimony was taken and the decision is one which all miners will be interested to read. The opinion of the court was as follows:

This case is one of vast importance. The amount in controversy, the lengthy trial, extending over a period of 13 weeks, the questions of law raised by the record, the learning and reputation of many of the witnesses, as well as the standing of the counsel employed, give sufficient foundation for this statement. While it has imposed upon the court careful and continuous study, and while the court is keenly alive to the great responsibility attending its decision, there have been many interesting features. The court has been permitted to explore the mysteries of nature. The testimony of the eminent scientists, all possessing a national reputation, and many with world wide fame, has been clothed in the most beautiful language and marked by a commendable spirit of fairness. They have "turned the granite leaves of the mountains" and explained how nature built her treasure vaults and placed therein the precious metals. It would be quite impossible to name in detail all these gentlemen, and quite invidious to single out any for special mention. It is sufficient to say, that the court was enlightened and charmed by such men as Hunt, Blake, Keyes, Diggett, Jenny, Clayton, Van Deusen and Palmer, men whose names are well known in the scientific world.

In these preliminary remarks, the court can do no better than adopt as its own the words of that most eminent jurist, Judge Field, in the Eureka-Richmond case, fourth Sawyer, 302, wherein he says: "Whatever could inform, instruct or enlighten the court has been presented;

Practical Miners Have Given

Their testimony as to the location and working of the mine; men of science have explained how it was probable that nature, in her processes, deposited the mineral where it is found. Models of glass have made the hill where the mining ground lies transparent, so that the court has been able to trace the course of the vein and see the chambers of ore found in its depths," to which, I may be permitted to add, that skillful draughtsmen, with beautiful maps, contributed their share. Assayers have tested the rock, and caused their mute tongues to speak. Photographers have, with admirable skill, reproduced the landscape, and specimens of ore and rock, almost innumerable, have been produced for the court's inspection. The court made an extensive visit to the mines in controversy, and examined the various workings and ore bodies, receiving the most generous attention from the litigants on each side.

In order to properly understand the case, it is well to refer to some of the salient features of the pleadings and proofs. The record shows that on January 6, 1885, the plaintiff filed its complaint in trespass, in which it alleged title to Bullion mining claim No. 76, in the Tintic mining district, Utah, stating that there is a lode of rock in place in said claim bearing silver and other valuable minerals, which has its apex wholly within the surface lines thereof; that the defendant, the Eureka Hill Mining Company, had trespassed upon said ore bodies and "are now working within said premises of the plaintiff beneath the surface," and threaten to continue said work and are doing great and irreparable injury.

The defendant answered fully the allegations of the complaint, and for cross complaint alleged its ownership of the Eureka claim No. 39, and of a lode of mineral therein, the course, strike and apex of which are in said mining claim, and between the side lines thereof, and parallel to said side lines. It is alleged that said lode is "very wide and dips westerly, and by a

Variation of the Hanging Wall

At one point, and for a short distance, the said wall and a small and comparatively unimportant part of the width of the lode is westerly of and outside of the westerly surface side lines of the Eureka mining claim, and within the Bullion. It likewise stated that the main part of the vein in its width is in and has its apex in the Eureka. That the Eureka is the older claim, and with the lode therein for its entire length was located and appropriated before the location of the Bullion, and that the same has been patented. That the plaintiff has for more than one year been in the possession and claiming to own the Bullion mining claim, and has set up and made, and still asserts an adverse claim to about 700 feet of the northerly end of said Eureka lode, claiming that it belongs to the Bullion. That it has sunk a shaft on the Bullion surface ground into the Eureka lode and is, and has been, extracting ore therefrom. That it continues by this action and otherwise to assert its adverse claim. The cross-complaint prays that the principal action be dismissed, and that the title of the Eureka to the lode in question be quieted.

The plaintiff answering the cross-complaints denied all the principal allegations thereof.

(Concluded on Page 99.)

MECHANICAL PROGRESS.

Cheap Machinery.

We take the following sensible remarks from the *Mechanical World*. They are applicable to any manufacturing country:

"One of the reasons why much of our trade has left us is cheapness. English engineers can turn out better work than the engineers of any other nation, if they choose to do so, but the competition which has grown up, during the last few years particularly, has been so severe that a very large, and we are afraid an increasing number of firms have, in the struggle to make ends meet at low prices, gradually let down the character of their productions until they can no longer be classed even as of medium quality. Manufacturers never make a greater error than when they sacrifice quality, and in severe competition should cease to seek orders which will not pay unless quality be sacrificed, for it is almost axiomatic that a firm's character is ruled not by their best, but by their worst quality of work, so that if once a manufacturer stoops to low qualities of work, he is doomed to remain there.

"As a proof of this, it is not a fact to-day that our busiest firms are those noted for invariably good quality? and are not the low quality men all struggling together in the rush for the poorer class of work? We have known many instances of individual firms who for long were known as one-quality men, and yet who, perhaps, in the push of bad times, have been tempted to take cheap orders. This has been their downfall. The cheap orders have demoralized the men, and the low tone, once entering is difficult to eradicate, and workmen say to each other, 'Oh! this will do; it's only for such and such an order'; and the result often is that, even with all its cheapness, the article turned out does not even secure as good a quality as its price warranted. Perhaps, if it had been finished no worse than its price, it would have given satisfaction, but it has not been so finished; it has been robbed of its poor birth-right, and being, perhaps, sent abroad, it has to compete with the work of the foreigner. Now, the foreigner is just at present putting forth his best efforts to compete with our poor efforts, and, of course, comes off the victor. If English engineers are to hold their own, they must simply do as they used to do, and make the words English and good synonymous terms. We are not here finding fault with cheapness, *per se*, for we all know that it is less expensive to build an engine now than it was formerly. We speak now more especially of what may be termed wholesale work, which is reproduced in hundreds. In this class, modern machinery has cheapened production in many ways, and the final price of the manufactured article may legitimately be correspondingly reduced.

"Economically, also, it is wrong to employ labor in producing had articles, for to put 20s. worth of labor upon the same value of raw material, to result in a 40s. article, is less economical than putting the same labor upon raw material of the value of 30s., for which perhaps 60s. will be finally obtained. It is often said that the wages of foreign nations being less, they are better able to produce cheaply than ourselves. This is, perhaps, true; but it is a fact daily becoming less burdensome to us, for with the spread of knowledge upon the European continent, workmen are becoming more alive to their true position, and shorter hours, with higher wages, cannot long be withheld. It is surprising that such is not even now a more burning question. Even in America, where it might be supposed a knowledge would have, ere this, spread of the short hours of work in this country, we find twelve hours a day to be the rule. We are not amongst those who think that a return to longer hours will be seen. The tendency of the day is to short hours, and if the world's production goes on increasing as it has done of late, the greatest question will soon be, 'What is to be done with our production?' Not, 'How much can we produce?'"

The Use of Steam Jackets.

It is surprising, says the *American Engineer*, to note how frequently one meets engineers, especially those in practical charge of engines, who have an idea that the function of the steam jacket is to prevent radiation of heat from the cylinder to the atmosphere, and regard its purpose in the same light as they do that of felting and lagging. But this not uncommon fallacy of considering it as a non-conducting device instead of as a supply of heat for the entering and expanding steam, is worthy of special mention. We know of a naval engineer in Government service, who, much to the discomfort of his assistants, insisted on having the highest attainable temperature in the engine room, closing up all doors, and windows, his directions being reinforced by the explanation: "What's the use of a steam jacket to prevent the radiation of heat from the cylinder, if the temperature of the room is not in the eighties or nineties?"

And this view is cropping out constantly, in many other ways, as when exhaust steam, or steam of a pressure much reduced below that corresponding to the initial pressure of steam, is let into the jackets. If a steam jacket is to be of any practical use, the temperature of the steam it contains must at least equal that of

the steam entering the cylinder. A queer and expensive kind of non-conducting device, indeed, in which the radiating surface is increased beyond that of the cylinder itself, and in which steam specially drawn from the boiler is the means.

Another writer on the use of the steam-jacket says: When you jacket with live steam you have a larger area for the condensation of steam than with the naked cylinder; but it is of less injury to condense live jacket steam than to condense cylinder steam, and it is less loss to condense exhaust steam in the jacket than to condense live steam in the cylinder. Of course the jacket must be properly formed. There should be an air space between the exhaust jacket and cylinder; and there should not be a current of exhaust steam passing through the exhaust jacket.

American Locks—Threatened Competition.

Hitherto American locks have met with a very large sale in England. The Pittsburgh lock manufacturers were especially held in favor by the London Government and other contractors, but the English lock-makers have recently determined to make a strong effort to secure that trade for themselves, and even to compete for the market in Canada, Australia, China and elsewhere, which has been generally supplied with American locks.

It appears that Messrs. Carpenter & Tildesley, a lock-making firm of Willenhall, near Manchester, have made up their minds to make the experiment at least. They have studied principles, construction and mode of manufacture of the Pittsburgh manufactures, have set aside \$50,000 to win or lose, as the case may be, and while they do not propose to imitate the exact designs of the Pittsburgh locks, they will come very close to them, and propose to put their goods on the market at a reduction of 30 per cent below the American.

How the Cheap Production will be Effectuated.

The English correspondent of the *American Manufacturer*, from whose letter we collate the above, continues as follows: A hint may be gained of how the cheap production will be accomplished when I state that in the manufacture of their wrought-iron rim locks the firm employ girl labor very largely. Two-thirds of the work in every lock is the outcome of girl labor. Their opponents, some of whom are gradually losing their Australian connection in consequence of the machine competition, are making the most in their own interests of the employment of girls by the firm, and are converting it into a "cry" against them.

Female Labor in the English Lock Trade.

But in fairness to the firm I must state that they assure me that in reality the advantage which they gain by the employment of females is not of much importance. They are, they say, paying as good wages as they would pay to young men, and they challenge comparison upon this point of their books with the books of their opponents. Of course female labor cannot be employed to do the casting which will be requisite for the entry into the American business, but it can be for the interiors, and if there is anything in it as compared with the cost of men's labor, that is one advantage which your Willenhall competitors will enjoy.

A STEAM PRESSURE REGULATOR.—An automatic regulator of the steam pressure within a boiler has been patented by J. Q. Everson, of Pittsburgh, Pa. A pipe is attached to the safety-valve, and, passing through the stack, enters the flues of the boiler. The pipe should be as large in diameter as the opening in the safety-valve, so that the escape of steam will not be retarded. When the steam pressure exceeds the safety limit it raises the safety-valve and escapes through the pipe into the flues. Thus the steam not only reverses the draft, but forces the gases that are non-supporters of combustion back into the fire. In this way the fire is cooled, the temperature is lowered and the pressure is reduced below the safety limit. The safety-valve then closes, the fire again burns and the hot gases are drawn through the flues into the stack. By the use of this invention an automatic regulation of steam pressure is therefore secured by utilizing the waste steam escaping from the safety-valve. A thorough test of the new appliance has been made at the Pennsylvania Ironworks, Pittsburgh, where for some six months past it has been in operation on a battery of eleven steam boilers with unvarying success. The device is stated to be as inexpensive as it is simple, for whilst performing its preventive functions, it also thoroughly cleans the flues and saves fuel.

IMPROVED BESSEMER STEEL.—A recent improvement in the Bessemer steel process as carried out at the Edgar Thomson Steel Works, near Pittsburgh, will have the effect it is said, of making Bessemer steel equal in quality to the crucible product, and at only about one-tenth the price. The change consists in a thorough mixing of the spiegeleisen with the molten iron in a ladle, and in such a manner as to make the carbonization much more uniform than at present. Bessemer steel can be produced at a cost of a cent to a cent and a half per pound, while that made in crucibles costs at least eleven cents a pound.

SCIENTIFIC PROGRESS.

Science in the Workshop.

Webster defines science as "knowledge, penetrating and comprehensive information, skill, expertness," and the like. Where, says the *Chicago Industrial World*, is there greater occasion for the acquirement of such comprehensive information in relation to the duties of every day work than in the shop? Here men deal with physical and mental questions. From wood and iron and steel they evolve forms which are the duplicate of previous mental conceptions. The angle or curve so beautifully fashioned in wood or metal is a reproduction from the mind. Yet there are those who contend that no previous mental training is necessary to make the good workman, or, if not going quite so far as this, contend that no previous orderly and systematic course of information is necessary to fit the workman for performing his duties in the most efficient manner. The whys and the wherefores of an art or trade are matters which some artisans disdain to look into. All they care for is to procure a certain effect. If the steel they are working can be bent and fashioned into shape under certain conditions of heat and pressure, that is all they care to know about the subject. How that steel acts under trial, why it will work to advantage when heated to one color, and will not when heated to another color, is a matter of seemingly useless speculation to workmen who think that practice is all that is necessary in the prosecution of their trade or occupation.

It is self-evident that the man who knows how a given metal will act under a thousand conditions, has superior acquirements to the one who only knows how it will act under a hundred conditions. Better still is the man who only knows why and how these various conditions arise. Frequently difficulties spring up in the shop when some material is under treatment or manipulation, which baffle the skill of the workmen, but which are easily overcome by means which some one familiar with the action of such material under such circumstances may suggest. The skill of the latter person is greater than that of the former, because he has more "penetrating and comprehensive information" touching the subject in hand, than the former.

Will anyone contend that the expertness, the "penetrating and comprehensive information" is of no avail in the shop? Young men, young engineers, young mechanics should by all means be taught to respect scientific methods of thought and labor. They should remember that there is an orderly, systematic way of arriving at conclusions, and a slipshod haphazard way. The workman may accomplish a certain effect and yet be ignorant of the real causes which lead up to the results obtained. He may strive for a similar effect again, and fail because of such ignorance. Knowing causes which produce effects, one can often calculate the results which a modification or change in such causes will produce. Science means thoroughness—exactitude. It means the understanding of one's work and not a blind groping after effects. It means the establishment of business upon correct principles—upon truths. What firmer foundation can there be than that which rests upon ascertained scientific principles? Such a foundation is everlasting—is impregnable.

Much of the opposition to scientific study in relation to shop practice arises from a lack of mental discipline. Men unaccustomed to study who cannot reason from cause to effect, who cannot arrive at a just conclusion from a given premise, cannot be supposed to be very enthusiastic over scientific studies. It is the old fight of ignorance against knowledge. But in the long ages to come knowledge will conquer ignorance and the light against science, research and study will give place to broader views and better methods.

DISCOVERY OF AN ANCIENT FRENCH FORT NEAR BOSTON.—The recent discovery of an ancient French fort on the Charles river leads Prof. Horsford to locate Norumbega, which has been a mythical place in New England history, at Salem. His researches have reached two important historical discoveries; first, the site of the landfall of John Cabot, in 1497; second, the site of the fort of Norumbega of the French, on the banks of the river bearing the same name. The results of his investigations in this direction are fully given in bulletin 2, of the American Geographical Society, just published. The site of the old French fort is in the immediate vicinity of Boston, being in the town of Weston, at the point where Stony Brook empties into Charles river. This research has, of course, involved years of geographical, historical and philological labor and study, and some of his gleanings have been from manuscript and map collections in the great public library at Paris. Professor Horsford holds out that Norumbega was a name which John Cabot brought back with him and did not know, but found out that Norumbega means "divided bay," or "divider of the bay," according as it is applied to land and water. It would apply to Salem neck; and all descriptions, maps, etc., pointing to this place as the landfall of John Cabot.

This discovery is a most interesting one, from the fact that if the above surmises are correct, Salem, Mass., must have been the first point on the American continent touched by Europeans, Columbus having reached nothing but islands

until after that time. Professor Horsford's careful researches in Algonquin history give him great advantages in his line. Old, mellow Salem may now put up a monument to John Cabot.

Measuring Sunshine.

Nearly fifty years ago, a plan was presented to the Cornwall Royal Polytechnic society of England for registering sunshine, continuously throughout the day. But nothing practical came of it until 1853. After various modifications, the idea was successfully carried out by means of an instrument, termed a heliostat, invented by Mr. J. F. Campbell, of Islay, by which the sun's rays, whatever be his altitude, were always reflected along the same direction throughout the day. This entailed the employment of clockwork to drive the reflecting mirror, and a similar power was also required to move the paper past the slit through which the sun's rays were admitted.

Mr. Campbell hit on the very ingenious notion of employing a glass sphere as a lens, so that as the sun traveled round the ball its image should travel round on the opposite side. The first instrument consisted of a ball placed inside of a mahogany bowl, turned to the exact focal length of the ball. Such a bowl was capable of receiving a record for six months from one solstice to the next. It was, however, impossible to distinguish the record of consecutive days from each other, and accordingly a plan had to be devised by which the record could be obtained on a slip of card hoard or other material which could be replaced daily.

A very ingenious frame was finally devised by Prof. Stokes, of Cambridge, provided with grooves into which the cards are slipped. The grooves are in three pairs—for the summer, the winter and the equinoxes respectively, and the cards have hour lines printed on them. The instrument can thus be used as a sun dial, for the spot where the solar image appears—where the burning is taking place—of course corresponds to the spot where the shadow of the gnomon would cut the scale of the dial. These instruments were first brought out at the end of 1879, and there are now nearly 50 of them in various parts of the United Kingdom.

CAN A HUMAN BEING BECOME PETRIFIED?—A medical journal, in an article on petrification of the human body says: "Petrification of the body of a warm-blooded animal never has been known, and it is quite safe to say, never has taken place. The condition of the body which leads to such a misconception is not that of petrification, but of saponification. It is explained that nitrogenous tissues give off ammonia, and this attacking the fats of the body produces adipocere, a hard form of soap. A gentleman at the New Orleans fair saw a barrel of pork labeled, 'Found floating in the Mississippi river in an advanced state of petrification.' Being skeptical as to the capacity of rocks to float, he chipped off a piece and found that the hog, like the human being under like circumstances, had merely turned to adipocere.

A SCIENTIFIC DISCOVERY.—Scientific investigators have found that the power of the bacillus of consumption is destroyed when other bacteria are grown in the same soil. Recognizing this fact, the new and remarkable idea has occurred to Dr. Cantani, of Naples, of fighting bacilli with other bacilli. If one of the organs of the body be attacked by a bacillus which is dangerous to human life, he introduces a bacillus which is not dangerous to man, but brings destruction to the dangerous bacillus. In the case of a consumptive patient, the doctor introduced a harmless organism known as the bacterium termo, and found that the bacillus tuberculosis gradually disappeared from the patient's expectorations.

AN OPEN POLAR SEA.—Lieut. Greely believes in the theory, and asserts the same in his lectures in England, that there is an open sea some 1500 miles in diameter round about the Pole that never freezes, and conjectures that the Pole itself is the center of an ice-capped land, covered with ice from 1000 to 4000 feet thick. These conclusions are rejected by prominent Arctic authorities in England.

MELTED STEEL UNDER THE MICROSCOPE.—Melted steel under the microscope shows a kind of cellular tissue, the iron forming the nucleus and the carbon the envelope of the cellules. These cellules form agglomerations known as compound cells, which are identified with what is known as the grain of the steel. Their surfaces are in the region of least cohesion.

MOONLIGHT AND SUNLIGHT.—"Among women especially," says a French writer, "it is regarded as a well-known fact that moonlight is not only more injurious than sunlight to the complexion, but that silk and woolen materials are faded more rapidly by the moon's rays than by the brightest sunlight."

THE HEAT OF THE SUN.—In the focus of a burning glass, the sun's rays will melt the most refractory substances. The heat, then, of the sun is most intense. If we were as near to the sun as we are to the moon, the whole solid earth would melt away as wax.

Saturday Morning, Feb. 6, 1886.

TABLE OF CONTENTS.

EDITORIALS.—A Novel Screw-Cutting Device; Periods of Fog, 93. Passing Events; Roscoelite; Telluride Ores; Fine Gold; Academy of Sciences; The New Gold Camp, 96. The Gritting Ore Roaster; New Steamships; Mining Accidents, 97.
ILLUSTRATIONS.—Hines' Patent Die Stock, 93. Gritting Ore Roaster; Section and Plan of Ore Kiln, 97.
CORRESPONDENCE.—Virginia City, Nevada.—No. 1, 94.

MECHANICAL PROGRESS.—Cheap Machinery; The Use of Steam Jackets; American Locks—Threatened Competition; A Steam Pressure Regulator; Improved Bessemer Steel, 95.

SCIENTIFIC PROGRESS.—Science in the Workshop; Discovery of an Ancient French Port near Boston; Measuring Sunshine; Can a Human Being Become Petrified; A Scientific Discovery; An Open Polar Sea; Melted Steel Under the Microscope. Moonlight and Sunlight; The Heat of the Sun, 95.

USEFUL INFORMATION.—Belt Shifting; Oil Paint for Floors; Ancient Dyeing; To Polish Horns; Indifferent Workmen; Ventilating Cars; Pneumatic Tubes Not New; Cold Liquid; Bronze; Polish for Marble, 99.

GOOD HEALTH.—A Genuine Mind Cure; Fitting Children's Shoes; Opposed to Bathing; Exercise for Insomnia; The Treatment of Frost-Bitten Fingers and Toes, 99.

MISCELLANEOUS.—Mineral Lodes, 94. Practical Hydraulics, 98.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 100-1.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 104.

Business Announcements.

Artificial Limbs.—Robert Reed, Oakland.

Physician.—J. P. Webb, Oakland.

Oxidizing Furnaces.—J. R. Brett, Oakland.

Engines.—H. W. Rice.

Passing Events.

The recent storms caused a number of serious and fatal accidents in the mountain regions of Idaho, Colorado and Utah. Several miners have lost their lives by snow-slides.

Several new gold mining districts have lately been organized. The Fresno district is in the county of the same name; Solo and Arrow districts are both in San Bernardino county. Arrow district is the new gold mining region about which there is some little excitement.

The stormy weather so long prevailing seems over, and just now we are rejoicing in bright sunshine in these latitudes.

There is quite a revival of gold quartz mining now prevailing, and the signs of the times are that many old mines will be reopened in this State, and many prospects developed this year.

The Sierra Buttes mine has been in operation for 34 years, and the owners are carrying on their explorations as though they expected the ore would hold out for another 34 years. A 60-stamp mill is kept in operation, and 250 men are constantly employed.

The Monitor mine and mill at Taylor, White Pine county, has been sold to the Eberhardt Company, the English capitalists who have operated largely in Hamilton for the past sixteen years.

An arrangement has been made by the Peer, Peerless, Crocker and Weldon Mining companies of Quijótoa, Arizona, to explore grounds by means of a tunnel instead of further individual sinking.

Fine Gold.

At Placerita, near Newhall, Los Angeles county, eleven miners are at work taking out \$6 per day. The Los Angeles Times says it is found that the gold is the first ever discovered in California, running \$19.75 to the ounce. An ounce of pure gold is worth \$20.6718. We give an instance in another column of this paper of gold from Tuolumne county bringing \$19.49 at the mint.

Our contemporary is in error, however, as to the Los Angeles gold referred to being the finest ever found in this State. Near Sonoma, Tuolumne county, there is considerable very fine gold. The gold from the San Guiseppe mine has been found to be worth \$20.32 per ounce; that from the Neale is worth \$19.64. This is, moreover, quartz, not placer gold. We gave the particulars in the PRESS of Dec. 5, 1885. Gold of 956 fineness is worth \$19.76 per ounce, and all the gold mentioned in this appended table over this 956 is worth more than the Los Angeles gold referred to.

In this connection it will be of interest to note the fineness of gold of this State from different localities, compiled from notes by John S. Hittell. The following shows fineness of placer gold:

Springfield Flat, Amador Co.....	965
Yankee Flat, Butte Co.....	960
Coon Hollow, Eldorado Co.....	970
Smith Flat " " " " " " " " " "	978
Spanish Hill " " " " " " " " " "	987
Sugar Loaf " " " " " " " " " "	963
White Rock Hill " " " " " " " " " "	965
Alpha, Nevada Co.....	968
Chalk Bluff " " " " " " " " " "	976
Deer Creek " " " " " " " " " "	956
Gold Hill " " " " " " " " " "	970
Omaha " " " " " " " " " "	975
North San Juan, Nevada Co.....	960
Timbuctoo " " " " " " " " " "	950
Blue Lead, Placer Co.....	944
Cedar " " " " " " " " " "	965
Dutch Flat " " " " " " " " " "	975
Michigan Bluff " " " " " " " " " "	970
Michigan Flat " " " " " " " " " "	970
Squire's Canyon " " " " " " " " " "	965
La Porte, Plumas Co.....	945
America Hill, Sierra Co.....	950
Bald Mountain " " " " " " " " " "	950
Gibsonville, Plumas Co.....	936
Nebraska " " " " " " " " " "	935
Pine Grove " " " " " " " " " "	920
St. Louis " " " " " " " " " "	925
Columbia, Tuolumne Co.....	950
Shaw's Flat " " " " " " " " " "	930
Springfield " " " " " " " " " "	960
Sugar pine " " " " " " " " " "	920

All the above figures relate to placer gold. Of quartz gold the following examples of fineness are given:

Plymouth, Amador Co.....	840
Night, Butte Co.....	890
Angels, Calaveras Co.....	900
Bovee " " " " " " " " " "	908
Flanigan " " " " " " " " " "	910
Morgan " " " " " " " " " "	910
Clipper Hill, El Dorado Co.....	900
Josephine Lode, Mariposa Co.....	918
Allison Ranch, Nevada Co.....	806
Gold Hill " " " " " " " " " "	875
Nevada " " " " " " " " " "	830
Union Hill " " " " " " " " " "	822
Washington " " " " " " " " " "	860
American Bar, Placer Co.....	860
Ironside, Sierra Co.....	900
Keystone " " " " " " " " " "	933
Rough-and-Ready, Sierra Co.....	900
Table Mountain, Tuolumne Co.....	950
Bald Mountain " " " " " " " " " "	950
Dannenberg, Yuba Co.....	900

In this connection a paragraph from the report of the State mineralogist will be of interest: "One grain of pure gold is worth \$0.0430963; one gram pure gold is worth \$0.6646+; one ounce troy of gold is worth \$20.671,791; one pound avoirdupois gold is worth \$301.46+; one ton (2000 lbs.=29,166.6 oz. troy), \$602,927.36; one cubic inch (10.12883 oz. troy), \$209.38; one cubic foot (17,597.9808+ oz. troy), 1205.4898 pounds avoirdupois; value \$363,409.85. The standard fineness United States gold coin =900; one cubic inch of standard gold, 9.0989 ozs.= \$169.25; one cubic foot standard gold = \$292,500.00. The average specific gravity of California gold dust, as it would be in a box or bag was found by the United States mint to be 9.01. It occupies about twice as much space as when melted into bars. A rectangular box, eight by ten inches, and five inches deep, will contain \$36,000 in gold coin laid in order, and \$27,000 poured in and shaken. A bag six inches by nine inches will hold \$5000 in gold coin with room to tie.

COLORADO is credited with a bullion product for 1885 of \$22,800,000, of which \$13,000,000 was silver, \$5,000,000 gold, \$4,000,000 lead, and 500,000 copper. As we have before stated, this shows that Colorado has her lead and copper credited to her, while California is not credited with these or with quicksilver borax, or any of her numerous mineral products. Of gold and silver Colorado only leads California by about three millions, California leading in gold. Of the total of Colorado product, Lake county (which includes the Leadville district) contributed \$12,357,662. This is about \$500,000

less than in 1885. The gold value of this Leadville product has been steadily falling off since 1880, yet it is stated that the quantity of silver produced in 1885 was 1,235,642 ounces greater than in 1884.

Roscoelite.

We have been shown some very rich and fine specimens of Roscoelite from the Stuckslager mine, Lotus, El Dorado county. The mine is a peculiar one in many respects. Although discovered ten or twelve years ago, it is but lately it was re-opened, and pay found again. At the time the mine was discovered, the mineral found was new to science, and was named Roscoelite, of which we have spoken more fully in recent numbers of the PRESS. This mine is, with one exception, the only place where the mineral has been found.

There is a quartz ledge or reef, in which the seam of Roscoelite is found. This seam runs from an inch in width down to a "knife blade." This seam, where wide, is very rich in gold, the gold being from 900 to 950 fine.

The gold is found all through the Roscoelite, though there is none to speak of in the quartz itself. None of the quartz is worked except that which lays next to the seam of greenish mineral, and that is ground in an arastra. This quartz is from two to six inches wide in the main vein. Sometimes there are several layers of quartz. The seam of Roscoelite sometimes pinches down very small, and then widens out into pockets, and these pockets are very rich. Sometimes quarter or half the weight is of gold. At a depth of 30 feet a \$11,000 pocket was found, and altogether \$80,000 or \$100,000 has been taken out of the mine.

They are now down 150 feet from the original surface, and are drifting and stoping. There is a tunnel connecting with the shaft by which waste is run out. At the deepest point they have taken out the richest of the seam, but they have not come to water level yet. The formation is now just the same as it was on top, when they got the rich pay in the early days of the mine.

The claim belongs to Messrs. McKenney and Woods. The claim is only about two miles from Coloma, where the discovery of gold by Marshall occurred. The Roscoelite is greenish black in color, has a greasy feeling, is soft, and crushes very easily in a mortar. The gold in it is free and in good-sized pieces. More or less of the gold-bearing mineral is sold for specimens. There is a mine of a similar nature about two miles from this one, which will shortly be worked.

Telluride Ores.

We were shown a few days since some beautiful specimens of telluride of gold, some of it in an apparently crystalline form. It was from the old Belmont mine, discovered by Patterson and Turner, as long ago as 1857. The mine is on Bald mountain, near Sonora, Tuolumne county, and belongs to Mr. W. E. Garrett. The gold is of the finest quality and brings \$19.49 per ounce at the mint. The ores are very rich indeed, since the white tellurium is abundant in them. From one piece of ore weighing seven pounds Mr. Garrett obtained 36½ ounces of gold, the gold being sold for \$19 per ounce at Columbia.

The mines are being worked by the owner. The richest of the selected ore is pounded up in hand mortars, and what is not treated in this way is worked in an arastra. They have been throwing away a good deal of the "white stuff" for a year or more, not knowing its value, and the owner, now that he has discovered that it is petzite, values the dump at many thousands of dollars. One piece, which he remembers throwing away, he now knows is worth over \$500. The dump will now be picked over again for the "white stuff." The large specimens brought here and sold were very fine, from half to three-quarters of the quantity being gold. The ore is all carefully sorted as it comes from the mine. Lately very rich rock has been taken out.

KERN COUNTY MINES.—The Sumner mines, Kernville, Kern county, Cal., are being purchased by an English company, who propose furnishing an abundance of working capital, and opening up the property on a large scale. The mines are already furnished with efficient machinery and a splendid water-power. In a few months, a great deal of mining activity may be looked for in this section of the country.

Academy of Sciences.

Professor Davidson presided at the meeting of the California Academy of Sciences on Monday evening last. Donations reported since the last meeting were: Several specimens fossil marine shells from Lewis creek, about 1200 feet above the sea level, and some scaly lizards, donated by Captain James S. Lawson; scorpions by Captain William Patterson, and a little snake called *aneila pulchra*. An interesting paper on the fauna and flora of the Yukon river, by Dr. Willis E. Everette, U. S. A., of Vancouver, W. T., was read. Dr. Everette described some of the heasts that roam through the forests and over mountains and moor in that far north country. Conspicuous among these are: A bear which occupies a place between the grizzly and polar bears, and is carnivorous, resorting to roots for subsistence only when driven to it by extremity, and which he named the Alaskan bear; the Alaskan moose and cariboo, which are much heavier than their Canadian cousins or the moose of Maine, and a deer something like our California deer. The Alaskan bear preys largely upon the moose, destroying whole droves of them when the snow crust, which remains intact under the shuffling and sliding gait of the flat-footed bear, is cut through by the sharp hoofs of the moose, making its retreat so slow and difficult that it falls an easy prey to its shaggy foe. The doctor described some beautiful song birds, and a number of game fowl of the grouse species, while the lakes are covered with myriads of wild geese, loon and other water-fowl. There is also a huzzard, which reminded him of the great California vulture. Of fish, the varieties of salmon and trout predominates. He saw no musk-ox, as they seek the more level regions toward the Mackenzie river.

Professor Davidson read some notes of observation on the planet Saturn, and a description of the locality in Volcano Canyon where the stone pestle exhibited at a meeting of the academy about a month ago, was found far below the natural surface of the ground.

Dr. Harkness pointed out some errors in classification made by Dr. Everette in his paper.

Professor Davidson read a report of appointments made by the council for the ensuing year as follows:

Publication committee—George Davidson, J. T. Evans, J. P. Moore, Charles G. Yale, Edward Lee Greene.

Curators—Botany, E. L. Greene and Mary K. Curran; entomology, E. S. Clark; conchology, Josiah Keep; mineralogy, A. W. Jackson and C. D. Gibbs; geology, Melville Attwood; ethnology and paleontology, Dr. A. B. Stout; ichthyology, Miss Rosa Smith; crustacea, radiates and reptiles, J. J. Rivers; ornithology, E. F. Lorquin.

The New Gold Camp.

In our "mining summary" this week further mention is made of the new Arrow mining district, San Bernardino county. Heretofore reports have been more or less vague, but if recent news is to be believed, they have a prospect of developing a good camp there. Mr. Daniel Edwards, foreman of the King mine, of Calico, who has recently visited the camp, reports the country as justifying the description of its prospects, as already given in the *Print*, and copied by us in the *PRESS*. The big ledge, which, though not so rich as the smaller ones, is considered the mainstay of the camp, can be traced a distance of four miles, and shows gold all along the entire distance. Huge blow-outs occur at intervals from the croppings of which assays of \$600 have been obtained. Every foot of the big lead is located, and scarcely any work of development has yet been done on it owing to the fact that the pioneers of the place spent their time in locating new ground in preference to exploring what they already possessed. The small ledges, which are in great numbers, are said to be very rich. Ten tons shipped from one of them realized \$1000. Wood is plentiful on the mountains near by. Water is plentiful within three or four miles of the camp, to which it is transported by the burro train. The only drawback to the speedy development and proof of the camp is, the lack of facilities for economically working the ore. At present it must be hauled at a cost of \$20 per ton to the railroad and shipped thence 80 or 100 miles before it reaches a mill. Consequently \$80 or \$100 ore is of the lowest grade that can possibly be handled.

The Grittinger Ore Roaster.

In concluding the short series of illustrations of ore-roasting furnaces such as are used in iron-producing regions, we give engravings of the Grittinger ore kiln. One of the figures is an elevation showing the roaster surmounted by a cast-iron hood and chimney, the chimney being shown as cut off so as not to take too much space on the page. The method of discharging the kiln is also exhibited. The other views show a vertical section of the roaster without a hood, and a top view looking down upon the central star-shaped cone, a portion of the shell and lining of the kiln being removed so as to show one of the chutes.

It is not necessary that the hood and chimneys be added, but where sulphurous ores are

except to raise the pivoted gate when filling a charging-barrow. Should there be any sign of unequal roasting, bars can be inserted in the openings in the shell, which also supply air for combustion to the outer portion.

There are 20 of these roasting kilns in use at Bird Coleman's furnaces, and six at North Cornwall furnace, Cornwall, Lebanon county, Pa.

A kiln 15 feet in diameter and of the proportions shown in the plate, will hold about 125 tons of ore, and will roast from 18 to 25 tons per day, dependent upon the amount of fine ore. The kiln is not claimed to have a complete desulphurizer like the gas-roasting furnaces, but it is the result of extended practical experience, and the various improvements embodied in it are believed by Mr. Birkinbough, who describes it, to permit better results than any

GRITTINGER ORE-ROASTER.

treated they are very advantageous in carrying off the sulphur-fumes. By preference, the cones and chimneys are made of cast-iron, wrought-iron deteriorating too rapidly.

The peculiarity of these kilns is in the lower portion. A series of column-brackets support a mantel carrying the shell of the kiln, and to these brackets are secured the ore-chutes and inclined bottom plates. In the center of the kiln there is erected a cone, star-shaped in section, the points of the star shutting against the column brackets; the spaces between the points or ridges, forming chutes of constantly decreasing incline and dividing the area of the kiln into practical uniform sections, thus encouraging a regular division of the ore to the outside chutes. A large flue passes up within the star-shaped cone and supplies ample air for combustion in the center of the kiln, as shown by arrows in the vertical section.

By erecting a kiln on a masonry base and providing pivoted grates, controlled by levers, to the outside chutes, a minimum amount of labor is required to discharge the ore. The ore and fuel (the latter generally culm, slack or braize) are charged at the top in approximate layers, and ordinarily no additional labor is required,

other form of roaster in which the solid fuel is mixed with the ore, driving off all the sulphur, which can be expelled by the simple application of heat.

WE received in San Francisco last month 71,167 tons of coal, of which Puget Sound regions yielded 23,597 tons, Oregon 4,020 tons and British Columbia 17,593 tons. The remainder came from Australia and the British Isles. The Puget Sound coal came from the following mines: Carbon Hill, Cedar River, South Prairie, Seattle and Green River. In the same month last year we received 89,677 tons of coal.

THE MINING AND SCIENTIFIC PRESS of January 23d, is a most valuable edition containing a complete report of the mineral production of all the States and Territories. It contains a whole volume of information on mining topics; in fact, this journal, published in San Francisco, is one of the best journals of the kind published in the country. It is always a welcome visitor.—*Elk Mountain (Colo.) Pilot.*

MINERS from Secret canyon, says the Eureka Sentinel, are hopeful that the coming spring and summer will witness big ore shipments from that section. The Geddes & Bertrand mine is looking and yielding well.

New Steamships.

The Oceanic Steamship Company has decided to order a new 4000-ton steamship to run between this port and Australia. Mr. John D. Spreckels, president of the company, has gone East to see Cramp, of Philadelphia, who built the Alameda and Mariposa, but he will have to underbid other American builders to get it. It may be mentioned that the Union Iron Works of this city may get the contract. In speaking of the probability of the work being done on this coast, Claus Spreckels expressed a decided preference for spending the sum (roughly estimated at \$600,000) at the ship-yards of San Francisco. The managers of the Union Iron Works will have a field of equal competition for the contract with several points in their

SECTION AND PLAN OF ORE KILN.

favor, and if it is found that the work can be done successfully here, Eastern builders will not get the work.

It is to be hoped that the Union Iron Works will succeed in getting the contract. They have not had an opportunity to build a very large vessel since their ship building plant and new works were completed. What work they have done, however, has been very satisfactory. They have expended large sums of money to establish a first-class iron ship building plant on the coast, and stand ready to expend more.

California steamship companies, therefore ought to "strain a point" to have the work done at home, where the money will be spent among our own workmen. There are still some necessary additions to be made to the Union Iron Works plant, but they would be made immediately if occasion demands. They have skilled workmen in designing and constructing, and the work would be under the immediate supervision of the owners. It is sincerely to be hoped that this steamship will be built there so that our only large ship building plant, adapted for iron vessels will be thoroughly tested.

Mining Accidents.

Joseph Kendall has had both legs broken by a cave in the Consolidated Esmeralda mine, at Aurora, Nevada, on the 28th ult.

Wm. Walker, a miner, while inspecting the Lima Consolidated Mining Company's shaft property near the Emerald mine, Tombstone, Arizona, fell down a winze a distance of thirty feet, striking on his feet, and broke his left leg badly below the knee, and dislocated his right ankle. The bones of his left leg protruded through his overalls when he was rescued.

Paul Champion, a miner at the Young America mine, Sierra City, Sierra county, had his hand hurt last Saturday.

A snow slide occurred on Lake creek nine miles above Ketchum, Idaho, in which three men lost their lives by being buried in the snow. Their names are Frost, Burro and Poters. They were working on the Home-stake mine owned by J. O. Swift and Harry Frost of Ketchum. A man by the name of Warring was also caught in the slide and was buried in the snow, but he succeeded in getting out and giving the alarm. All four men were in the cabin, when Warring stepped outside the door for a moment. Before he could get inside the avalanche struck and buried them all. Warring could hear Frost groaning for six or seven hours after the slide struck, and after that time all became still.

Three men were killed by snow slides at the Excelsior mine, Colorado, last week.

Tom Loring is reported to be buried under sixteen feet of snow on Thompson creek, a tributary to Warm Springs creek and about fifteen miles from Ketchum, Idaho. About half an hour before the slide he went from the mine to his cabin, where, in all probability, he met his death.

A fatal snow slide occurred near the Crescent mine, Park City, Utah, last week. The men had left the mine with the ore teams, and did not arrive below at the proper time. Investigation showed that an avalanche had caught them shortly after leaving the mine. All the men at the Crescent and Apex mines went with picks, shovels and lanterns, and in half an hour 200 men were at work trying to save the unfortunates. The drivers of the teams were William Sessions and Alonzo Gallard, who had in company with them William Backus and Frank O'Hara, who had been up to the mine in search of work. Mr. J. C. Cleveland was also in one of the rear sleighs. The fearful avalanche struck and hurled them with the speed of lightning into the bottom of the gulch, some distance below, completely burying both men and teams. Mr. Cleveland was fortunate in being thrown against a tree to which he clung for dear life. Although completely covered, he was still in such a position that he was enabled, by almost superhuman strength, to work his way to the surface by the aid, which the assistance of Mr. Nichols, who had left his sleigh and hurried back, afforded him. He was the only survivor, and with the exception of a dislocated shoulder dressed by Dr. Le Compte, who was early on the scene, he walked down the canyon to his home. The other four men were dug out as speedily as possible, but all four men were dead when extricated. The most unaccountable circumstance of this event was the fact that not one of the eight horses attached to the sleighs were injured in the least. After being dug out and cut loose they all galloped down the canyon and reached their stables ahead of the rescuing party.

SENATOR STANFORD, in speaking of California mining interests, says: "The mining development of the State is still very large. The gold yield aggregates well. I have owned some mines, and in one of them we made a profit when we got \$4 of metal out of a ton of the quartz. Indeed, quartz mining is probably in better condition in California than it has been for a good while. The great interest of the new west, excepting California and Utah, is first the mines and next cattle. Now, in the State of California, we probably find more than 125,000 persons engaged in agriculture, and that is a larger proportion than anywhere west of the Rocky mountains, possibly excepting Utah. Hence the mining interest is an important one to be supported. This is why upon the silver question I am for the continued coinage of silver."

A NEW mining district, called Solo, has been organized in San Bernardino county, and S. V. Morris has been elected recorder. The boundaries of the district are as follows: Commencing at a point at northerly end of Cronese lake and running thence easterly to Mesquite springs, on the Ludlow road; thence easterly to Marl springs on the old Hardyville road; thence northerly to Highland springs on the Ivanpah road; thence westerly to the northeast corner of the Five Points district; thence westerly along the southeast side line of Five Points district to the place of beginning.

FRESNO MINING DISTRICT.—A short time since, the miners of Fresno county, west of Fine Gold District, met and formed a new one called Fresno Mining District. A correspondent writes us that the new district is showing up some fine prospects, and by early spring good reports will be heard from them.

PRACTICAL HYDRAULICS.

NUMBER 16. COPYRIGHTED.

PRINCIPLES OF HYDRAULICS.

[Written for MINING AND SCIENTIFIC PRESS by P. M. RANDALL.]

Then $8.448 \times 5 = 42.24$ feet loss of head in 5 miles;
 $400 - 42.24 = 357.76$ feet effective head.—Ans.

Comparing results with respect to the 2.5-foot pipe of Ex. 72, and the 3-foot of Ex. 73:

$357.76 - 294.40 = 63.36$ feet, it is seen that the loss of head in the 3-foot pipe is 63.36 feet less than in the 2.5-foot pipe, which, in matters of economy, is of no little importance.

Ex. 74.—The elevation of the Guenoc Reservoir Site of the Feather River Water Co. is 1015 feet above the city base of San Francisco. The measured distance of pipe-line between the reservoir and the city is 104.83 miles. How many gallons of water a day (24 hours) will a pipe 40 inches diameter, whose inlet is at the reservoir, and outlet at San Francisco, deliver at an elevation of 350 feet above city base?

Cal.— $1015 - 350 = 665$ feet, total fall; $665 \div 104.83 = 6.34$ feet fall per mile.

In "fall per mile" column, Table 17, the nearest approximate fall to 6.34 feet is 6.336 feet, opposite which, in "40 inches," right hand column "diameters," is found 34.68 cubic feet, the discharge per second.

$24 \times 60 \times 60 = 86,400$ seconds in 24 hours; $34.68 \times 86,400 = 2,996,352$ cubic feet discharge in 24 hours.

In 1 cubic foot are 7.5 gallons nearly; $2,996,352 \times 7.5 = 22,472,640$ gallons.—Ans.

Ex. 75.—At a quartz mill, requiring 225 effective horse-power, the efficiency of the water wheel, in excess of the loss by nozzle resistance, is 60 per cent; the length of the pipe line is 3 miles, and the elevation of the reservoir, on point of water supply, is 500 feet above the point of application of the water at the mill. Required the diameter of the pipe to carry the requisite quantity of water?

Cal. 1st.— $225 \div .60 = 375$, total horse-power.
 $375 \times 550 = 206,250$ "foot pounds;" $206,250 \div 62.5 = 3300$ cubic feet $\times 1$ foot, which we will term *foot volume*.

Assume the loss of head by the internal surface resistances of pipe 10.56 feet per mile; then $10.56 \times 3 = 31.68$ feet, total loss of head.

$500 - 31.68 = 468.32$ feet, effective fall; $3300 \div 468.32 = 7.05$ cubic feet flow required per second.

In "fall per mile" column, Table 17, find 10.56 feet, opposite which, in right hand column "diameters," find 7.05 cubic feet. This is found under heading "20 inches." Hence the diameter of the required pipe is 20 inches.—Ans.

Cal. 2d.—By Cal. 1st, the "foot volume," corresponding to the "foot pounds," required at the mill, is $= 3300$ cubic feet $\times 1$ foot.

Assume 4.224 feet, the loss of head per mile due pipe resistances; then $4.224 \times 3 = 12.672$, total loss of head; $500 - 12.672 = 487.328$ feet, effective fall; $3300 \div 487.328 = 6.77$ cubic feet required per second.

In "fall per mile" column find 4.224 feet, opposite which, in right hand column, "diameters," find 7.32 cubic feet. This is found under heading "24 inches." Hence the diameter sought is 24 inches.—Ans.

Cal. 3d.—By Cal. 1st, the "foot volume," corresponding to the "foot pounds," required at the mill, is $= 3300$ cubic feet $\times 1$ foot.

Assume 21.12 feet, the loss of head per mile due pipe resistances; then $21.12 \times 3 = 63.36$ feet, total loss of head; $500 - 63.36 = 436.64$ feet, effective head; $3300 \div 436.64 = 7.55$ cubic feet required per second.

In fall per mile column find 21.12 feet, opposite which, in right hand column, "diameters," is found 7.65 cubic feet—a very near approximate to 7.55 cubic feet, the required quantity. This is found under heading "18 inches." Hence the diameter sought is 18 inches.—Ans.

Maximum Work.—To determine the maximum work, which water subjected to flow through a long pipe under pressure will perform, on issuing from the pipe:

Let h = the total head, exclusive of the inlet head, which, rarely in practice, exceeds 1.5 feet.

$a = h_f$, the friction head, expended in overcoming the resistances within the pipe.

d = diameter of pipe.

l = length of pipe.

$r = \frac{d}{4}$, hydraulic mean radius regarded constant.

c_f = coefficient of friction of resistances within the pipe regarded constant.

g = acceleration of gravity.

v = velocity of water in the pipe per second.

\bar{n} = ratio of circumference to diameter of pipe.

$h = h - a$, head for effective work.

W = total weight of water discharged per second.

w = weight of a cubic foot of water.

$\frac{\bar{n} d^2}{4}$, area of cross section of the pipe.

u = maximum work performed by the water per second.

Then $u = W h_f = a v w h_f$. (142)

Substituting in (142), the values of

$$a = \frac{\bar{n} d^2}{4}, v = \left\{ \frac{2 g r h_f}{c_f l} \right\}^{\frac{1}{2}} \text{ of (Eq. 129).}$$

$$r = \frac{d}{4} \text{ and } h_f = h - a.$$

$$u = W h_f = \frac{\bar{n} d^2}{4} \left\{ \frac{2 g d}{c_f l} \right\}^{\frac{1}{2}} \frac{1}{2} x^{\frac{1}{2}} (h - x). \quad (143)$$

Differentiating (142), omitting the constant factors $\bar{n}, d, g, c_f, l, 2$ and 4,

$$\frac{du}{dx} = 0 = \frac{h x^{-\frac{1}{2}}}{2} - \frac{3 x^{\frac{1}{2}}}{2}. \quad (144)$$

Transposing and reducing (144).

$$x = \frac{h}{3}. \quad (145)$$

Differentiating (144),

$$\frac{d^2 u}{dx^2} = -\frac{h x^{-\frac{3}{2}}}{2} - \frac{3 x^{-\frac{1}{2}}}{2} \quad (146)$$

As the second differential coefficient is negative, the function u representing the work performed is a maximum where $x = \frac{h}{3}$, as found in Eq. (145).

Thus it is shown that, in theory, the work performed by water after flowing through a pipe, is a maximum when the head expended in overcoming the resistances of the pipe is equal to one-third of the total head, exclusive of the inlet head. A modification occurs, however, with respect to this result, owing to the experimental coefficient of resistance being variable, by undetermined law, instead of constant, as assumed in our solution. Another source of variation is evidently due to difference in diameters of pipes. An inspection of Table 17 shows, that in practice, the ratio of the head expended in overcoming the resistances in a clean iron pipe is approximately equal to $\frac{1}{3}$, as a mean, instead of $\frac{1}{3}$ as found, of the total head. The remaining part of the total head amounting to nearly $\frac{2}{3}$ as a mean, applies to effective work.

Cal. 4.—By Cal. 1st, the "foot volume" (substituted for "foot pounds" for convenience of calculation) required at the mill, is 3300 cubic feet $\times 1$ foot.

Applying the ratio, $\frac{2}{3}$, proposed in the preceding article, there results: $500 \times \frac{2}{3} = 187.5$ feet, loss of head by friction; $187.5 \div 3 = 62.5$ feet, loss of head per mile.

In "fall per mile" column, the nearest approximate to 62.5 feet is 63.36 feet, loss of head per mile; then $63.36 \times 3 = 190.08$ feet, total loss of head $500 - 190.08 = 309.92$ feet; effective head $3300 \div 309.92 = 10.65$ cubic feet flow required per second.

Opposite 63.36 feet in "fall per mile column," Table 17, is found 13.65 cubic feet, nearest approximate to 10.65 cubic feet, the required quantity. This is found in "18 inches" column of contents for "diameters." Hence the pipe meeting the requirements is 18 inches diameter.—Ans.

Remark.—In "16-inch column," opposite 63.36 feet "fall per mile," is found 9.95 cubic feet, which is less than the required quantity. Hence a 16-inch pipe is too small. The velocity in a 17-inch pipe is $v =$

$\left(\frac{0.644}{1.19} \times 0.012 \times \frac{1}{4} \right)^{\frac{1}{2}} = 7.46$ feet per second for 63.36 feet fall per mile. The discharge per second in a 17-inch pipe will be $\left(\frac{1}{2} \right)^2 \times 7.854 \times 7.46 = 11.76$ cubic feet per second.

This amount, 11.76, exceeds the required amount of 10.65 cubic feet. Hence a 17-inch pipe will carry sufficient water to do the work. The margin of safety, $11.76 - 10.65 = 1.11$ cubic feet, however, is small.

An 18-inch pipe affording a margin of safety of $13.65 - 10.65 = 3$ cubic feet seems, by no means, large. Even a 20-inch pipe, with a fall of 63.36 feet per mile, and affording a margin of 7.34 cubic feet per second, would not exceed the limits imposed by D'Aubuisson, in his advice to engineers, if, indeed, it would the limits of true economy.

Reverting to the results obtained by 1st, 2nd and 3rd calculations for Ex. 75, and to the tabulated results corresponding respectively to these, or approximately so, it will be seen that in the first case there is no margin of safety, in the second .55 cubic feet, and in the third .10 cubic feet per second. This in practice would be inadmissible. A margin of .33 per cent is none too large. So that if on portions of the

lines steeper grades could not be had, it would be better to employ a "22-inch" pipe in the first case, a "27-inch" in the second, and a "20-inch" in the third case.

Inlet Head.—The inlet head is equal to the sum of the head expended in generating the velocity in a pipe, and the head expended in overcoming the resistance of entry.

Thus transposing Eq. (109), we have the inlet head,

$$h_i = h_r + h_e. \quad (147)$$

Substituting the values of $h_e = \frac{v^2}{2g}$ of Eq. (110), and of $h_r = c_r v^2$ of Eq. (116), noting that $c_r = .505$ of Eq. (127),

$$h_i = 1.505 \frac{v^2}{2g} = .0234 v^2. \quad (148)$$

Rule 34.—The inlet head is equal to .0234 times the square of the velocity in the pipe.

Ex. 76.—The velocity in a 14-inch pipe is 4.18 feet. What is the total head, the pipe being one mile long?

Cal. 1st.—Find in velocity column, Table 17, for "14 inches diameters" of pipes, the given velocity, 4.18 feet, opposite which, in "fall per mile" column, is found 26.40 feet, the head required to overcome the resistances of the pipe.

In velocity column, Table 18, find 4.17 feet, nearest approximate to the given velocity, opposite which, in "inlet head" column, is found 4.06 feet. Then

$$26.40 + 4.06 = 26.806 \text{ feet, total head.} \text{—Ans.}$$

Cal. 2d.—Find, as by Cal. 1st, the fall 26.40 feet.

By Rule 37:
 $(4.18)^2 \times .02337 = .4083$ feet, inlet head; $26.40 + .4083 = 26.8083$ feet, total head.—Ans.

Ex. 77.—A pipe, 33 inches diameter, being 5 miles long, and the velocity of flow in it 9.80 feet per second, what is total head?

Cal. 1.—In Table 17, opposite 9.80 feet, velocity for a "33-inch" pipe, find in "fall per mile column," $47.52 \times 5 = 237.6$ feet, head due resistances in pipe.

In Table 18, in velocity column, the nearest approximate to the given velocity is 9.83 feet, opposite which, in "inlet head" column, is found 2.257 feet; then $237.6 + 2.257 = 239.857$ feet, total head.—Ans.

Cal. 2.—Find, as in Cal. 1, the friction head $= 237.6$ feet.

By Rule 34,
 $(9.8)^2 \times .02337 = 2.244$ feet, inlet head; $237.6 + 2.244 = 239.844$ feet, total head.—Ans.

Remark.—The inlet head, except in case of great velocity, is, in practice, usually omitted as insignificant. Thus applying it in Ex. 75, the velocity due the friction head, 63.36 feet, employed in Cal. 4, is by Table 17, 7.73 feet for an "18-inch" pipe.

By Table 18, the inlet head, due 7.74 feet velocity nearest approximate to 7.73 feet, is 1.40 feet, which is seen to be small in comparison with the given head of 500 feet.

Mineral Lodes.

(Continued from Page 94)

It will be seen that the defendant in the principal suit occupies the position of the plaintiff in the cross-action. The issue formed upon the pleadings of the cross-action were brought to trial before the principal case, on a ruling by this court that it is an equitable action, and on the assumption that it is so related to that case that the decision in it will affect the determination in the principal action. The testimony shows that

The Eureka Claim

Was located in the year 1870. In accordance with the mining law of 1866, and the Bullion claim was not located until several months after the Eureka, a patent was granted for this Eureka claim on September 27, 1875, "pursuant to the act of 1866, the amendment of 1870, and the act of 1872," giving exclusive right of possession and enjoyment of all the lands included within the exterior lines of said survey not herein excepted from these presents, and of 2,200 linear feet of the said Eureka mine, vein, lode, ledge, or deposit, for the length hereinbefore described throughout its entire depth, although it may enter the land adjoining, and also of all other veins, lodes, ledges or deposits throughout their entire depth, the tops or apexes of which lie inside the boundary lines of said survey at the surface, extended downward vertically, although such veins, lodes, ledges or deposits in their downward course may so far depart from a perpendicular line as to extend outside the vertical side lines of said survey; provided that the right of possession hereby granted to such outside parts of said veins, lodes, ledges or deposits shall be confined to such portions thereof, as lie between vertical planes drawn downward through the end lines of said survey at the surface, so continued in their own direction that such vertical planes will intersect such exterior parts of said veins, lodes, ledges or deposits. And provided further, that nothing in this conveyance, shall authorize the grantees herein, their successors or assigns, to enter upon the surface of a mining claim owned or possessed by another. To have and to hold said mining premises, together with all the rights, privileges, immunities, appurtenances of whatsoever nature thereunto belonging, unto the said Eureka mining company of Utah, and to their successors and assigns forever, subject, nevertheless to the following conditions and stipulations: First—That the grant hereby made is restricted to the land hereinbefore described as Lot No. 39, of 2,200 linear feet of the Eureka mine, vein, lode, ledge or deposit, for the length aforesaid throughout its entire depth as aforesaid, together with all the veins, lodes, ledges or deposits throughout their entire depth as aforesaid, the tops or apexes of which lie inside of the exterior lines of said survey, as against all persons claiming under locations made upon such other veins, lodes, ledges or deposits, subsequent to May 10, 1872, but subject to the rights of other parties to follow any other vein or lode, with its dips, angles and variations, legally hold under a location made prior to such date.

At the conclusion of the plaintiff's testimony, a motion for a non-suit was made, and the ruling of the court thereon eliminated many questions of law from this controversy. The proof then showed that the Eureka claim was located along the course or strike of the Eureka lode, the same having a clearly defined apex throughout the entire length of the claim, and that towards the northern end of the claim the lode was very broad, extending westerly beyond the side lines of the Eureka and apexing in the Bullion. It was contended by the Bullion, that

A Location Upon a Vein.

The apex of which is wider than the location does not include the whole vein. That when the outcrop is so wide that it extends into adjoining claims, then the side lines must be run down vertically. This court overruled the motion and summed up its conclusions of law upon the facts as then presented, as follows:

First—The first locator upon the apex of a vein or lode is entitled to the entire width of the vein or lode, within the end lines of his claim, so long as the vein in its course or strike, remains within the side lines of the claim.

Second—The statute of 1872, instead of restricting the rights of locators, enlarged them so as to include not only the vein or lode first discovered, but also all other veins or lodes which have their apexes within the claim.—Copp's Handbook of Mining Law, 7.

Third—In the present case there can be no question as to the right of the Eureka Mill Mining Company

To the Entire Lode

In controversy. The location was made prior to the location of the Bullion; it was made under the law of 1866. The law of 1866 gave to the locators the entire lode, and the patent issued to the Eureka Company, carefully preserves all the rights gained by being located under the law of 1866.

Patent titles, when granted, relate to the first initial step, which is the foundation of the right, and in pursuance of which the patent is granted—Kahn vs. Telegraph Company, 2 Utah, 188.

(To be Continued.)

USEFUL INFORMATION.

Belt Shifting.

Have you got belt-shifters on the lathes in your shop? Can you run the belt off the spindle pulley, and then guide it upon the big steps of an over head pulley, with a neat little gas-pipe rig?

Can you do this, or must your men juggle the belt up there by slight-of-hand, or coax it up with a shaft measuring stick or a ten-foot pole?

That belt is very greasy; it will not catch on that smooth pulley; you get desperate, give a big lift with your pole and the belt catches, but it takes the pole with it, and your oil can, and your hat and spectacles, and the gas fixtures, and wipes them all up.

This business is all nonsense. Get enough one inch steam pipe to reach from the floor above to your floor, or to a nice step attached to the latho bed. Set it to line with the middle step of the overhead pulley, and about 12 inches from it.

Put a tee in the pipe just below the lower side of the pulley. Screw an eight-inch or ten inch pipe into the tee. Now make a stirrup belt-shifter, just like the one on that screw planer. Make the shank to slide in the short piece of pipe, and of the same length. Put up a couple of stops, or nail up two pieces of board to the floor joist, so that the belt arm cannot turn far enough to throw beyond the big or small step. Clump on a handle or make one with another tee and long nipple, placed where convenient to get hold of.

Put the belt through that stirrup guide, and you can shift your belt ten times while your neighbor is hunting up a greasy pole.

OIL PAINT FOR FLOORS.—For the painting of floors with oil paint, we should, says the *Builder and Woodworker*, only select such as contain earthy coloring substances and no lead, as all paints containing the latter wear off too easily. A floor that is covered with oil paint, and which is comparatively easily rubbed off, can safely be considered to contain lead. Lead is generally added on account of its superior density and body, and also being much more easily applied than most other substances. Even varnish that has been prepared by the use of litharge is objectionable, on account of being too readily worn off. Two coats of paint are usually employed, and care should be observed not to apply the second before the first is fully dry. If it is desired that the floor should present a varnish-like luster, the following may be employed, whereby the paint becomes even more durable: Dissolve two parts of shellac in eight parts of alcohol of about 80 per cent, and add to it one-quarter of a part of camphor. When the whole has been completely dissolved it can be filtered or strained through a cloth, in order to separate the suspended impurities. With this lac the floor is painted over once or twice, as may be required. By the application of the lac the paint adheres much better and is not so easily worn as though it were directly exposed; and when the lac has been partially removed, all that is necessary is to renew the simple application of the varnish.

ANCIENT DYING.—The use of colors was certainly known to the Americans from the most remote antiquity. The ochres, soot-black and lime doubtless furnished them their first coloring elements, and there was nothing in the idea of using these pigments above the most primitive conceptions. Experiment induced a rapid progress, and men learned to extract natural colors from roots, stems, leaves, fruits and seeds. A colored matter was also borrowed, like the Tyrian purple, from sea-mollusks. The Peruvians and the Mexicans knew how to place the colors upon their cloths. The goods were then exposed to the action of the light, and tints varying from a delicate rose to a dark violet were obtained. The colors were so fixed that they were not even modified by the decomposition of dead bodies. In the collection of cloth from the Peruvian huacas at the museum of the Trocadero, in Paris, wrappings of mummies that have been prepared for centuries still retain their primitive color on their time-eaten threads.

TO POLISH HORNS.—To polish common cows' horns and give them a fine gloss for fancy work, first scrape with glass to take off any roughness, then grind some pumicestone to powder, and with a piece of cloth wetted and dipped in the powder, rub them until a smooth finish is obtained. Next polish with rottenstone and linseed oil, and finish with dry flour and a piece of clean linen rag. The more rubbing with the stone and oil, the better the finish.

INDIFFERENT WORKMEN.—It is wonderful how little success will satisfy a man. As soon as certain mechanics are enabled to accomplish a portion of their work with reasonable skill, they at once conceive the erroneous idea that they have nothing more to learn, and assume by this very attitude that they are masters of their art. Upon observing such workmen we are forcibly impressed with the belief that "a little learning is a dangerous thing."

VENTILATING CARS.—Every one who has crossed the plains by rail, or passed over the desert country through which the Southern Pa-

cific railroad runs between Los Angeles and Denning, is well aware of the great nuisance and inconvenience of the dust, if even the last crevice or door is left open for ventilation. All such will be glad to learn that a Salom, Mass., man has invented a method of ventilating railway cars by means of fans revolving underneath the car, through gearing attached to the axles. The air is forced up into the car through pipes having bell-shaped, movable openings above each seat; but this air is freed from dust by passing first through water. The Boston & Lowell road is testing the device.

PNEUMATIC TUBES NOT NEW.—There is nothing new in the idea of pneumatic tubes. A pneumatic conveyor for letters, etc., was suggested by Dr. Lapin, in 1695; patented by Madhurst in England, 1810, on the compressed air principle, and by Valentine, in 1821, on the exhaust principle.

GOLD LIQUID.—Mix bronze powder with gum water; a little spirits of wine will make it keep better. The proportions are easily ascertained by trial. Pieces of glass may be put in the bottle to assist in shaking up the heavy powder, which settles at the bottom.

THE ENAMEL ON BRASS SIGNS, by which the letters which are cut into the metal are filled up, is made as follows: Mix asphaltum, brown japan and lampblack into a putty like mass, and then fill in the spaces, and finally clean the edges with turpentine.

BRONZE.—Bronze is a mixture of copper and tin, and sometimes lead, the proportions of which vary somewhat, but are usually nine to one. It is often adulterated with zinc, but when this is the case the surface honeycombs on exposure.

TO REMOVE VARNISH without injuring paint, brush on spirits of ammonia or hartshorn, which softens the oil, allowing of its being rubbed off easily.

SOLID LEATHER SHOE BUTTONS are now made at the rate of two or three hundred per minute. They grow a brighter jet the longer they are worn.

POLISH FOR MARBLE.—One-half ounce of magnesia; two ounces oxalic acid; one pint of warm rain water. Use a white woolen cloth.

GOOD HEALTH.

A Genuine Mind Cure.

A lady at the South End was enjoying a visit from her mother, who had been stricken with paralysis some years previous. As soon as she arrived at her daughter's home she stipulated that she must sleep downstairs, as her health would not permit her to climb upstairs. The man of the house, like a dutiful son-in-law, gave up his bed below and went upstairs himself. Finally a severe storm broke out, and the lightning and thunder were terrific. The lady of the house, a little timid, thought she would light the gas in the dining-room. As she had done so and turned to go back to the bedroom she was startled to see the face of a rough-looking man peering at her from one of the piazza windows. The woman, in her night clothes, was chained with fear for only an instant, and then, without uttering a sound, she fled upstairs to awaken her husband. In the meantime the old lady, her mother, heard her daughter's bare feet pattering swiftly across the floor, heading for the stairway, and intuitively feeling that something was wrong, and entirely forgetting her own condition, sprang from the bed and fairly flew after her daughter. She reached the stairway, and, in spite of her paralytic infirmities, which she had so carefully nursed for years, found herself rushing upstairs. Her daughter heard the steps behind her, and supposed the man she had seen on the piazza had broken in and was pursuing her. Not for an instant did she imagine that her invalid and paralyzed mother could move so rapidly. This added to her fright and increased her pace. She rushed up to her husband's bedside shouting "Save me! Save me!" and looking round saw—her invalid mother.

"Why, mother, is this you? I thought you couldn't walk upstairs."

"I thought I couldn't, but I never tried before."

Then the man of the house went below to reconnoitre as to the visitor on the piazzas, and grandma crawled into bed. She always went upstairs to sleep after that.

A squad of 15 gypsies had taken possession of the piazza to shelter them from the storm, and the gentleman, not having the heart to turn them out until the rain was over, allowed them to remain.—*Hartford Times*.

FITTING CHILDREN'S SHOES.—Children's boots and shoes should be accurately fitted, else permanent injury may be the result. Even if strict economy has to be practised in every other detail of the wardrobe do not be penny wise and pound foolish with regard to this matter. Many grievous troubles have been traced to the badly fitting boot. Happily the high heel, placed almost in the center of the foot, is fast disappearing, but there is still a tendency to cramp the toes. When women

realize that a broad sole gives the greatest comfort to the foot there will be no more of the lance-shaped thigs with narrow soles and spray uppers that are so ugly. It is a pity that all boots cannot be hand-sowed; for how many tender little feet are made to suffer from the heavy thread, and the cruel wire nails that so often force their way through the inner lining of a machius-sewed boot. An ill fitting boot, too large or too small, will rub the feet and sometimes cause acute inflammation. A young girl had long suffered from severe pain in the head, which extended to the eyes and caused so much distress that the eyesight became impaired. Several physicians prescribed various treatment, but without success. Finally a consulting physician asked to see her boots, which were of the most approved pattern, pointed toes, narrow soles and high heels almost in the middle of the foot. "Ah," said the doctor, "here is the cause of all your trouble. Get a pair of broad-soled, flat-heeled boots, and never put on those monstrosities again. My word for it, in a short time you will feel like a different person." All that the doctor said was fully verified. In a fortnight the unfavorable symptoms had disappeared and the young girl seemed to have received new life. Three years have passed since the sensible boots were first worn, and during all that time there has not been an ache or a pain to disturb the perfect health with which the girl is blessed.—*N. Y. Commercial Advertiser*.

OPPOSED TO BATHING.—He laid down a package which he had just finished tying up, and wiped his hands on the front of his vest. His stood behind the counter of a South-side grocery store. His face was broad and red, and overflowing with good nature and perspiration. He looked as though he might weigh two hundred.

"So you would like to see a man who is opposed to bathing, would you? Well, here he is; take a good look at him. He is never sick and never had a cold."

"You don't look as though you would go into a rapid decline soon."

"No; and I don't feel like it. I am 45 years old and weigh 195 pounds. I am opposed to bathing. If a man wants to open the pores of his skin once or twice a week and lay himself open to the attacks of disease, let him do it."

"How long ago did you discover this principle in hygiene?"

"If you mean when did I stop bathing, about ten years ago. Not entirely, mind you. I take a light invigorator twice a year, just to keep my skin fresh, you know. May be this is too often, but I find it agrees with me best. I get into a tub on the 1st of January and on the 4th of July. Now you are laughing, but remember, young man, I am older than you and have had experience. Did you ever see a cow haths? No, I thought not. A cow refrains from bathing by instinct, yet they are as clean an animal as lives. I merely take a rough towel every night and rub myself down, and change my clothes often. If the cholera comes here this season, I think I can defy it. I never had a contagious disease in my life, yet I have attended to people who had the smallpox, and have been among contagious diseases of all kinds."—*Pittsburg Dispatch*.

EXERCISE FOR INSOMNIA.—If you are not accustomed to walking, be careful not to become fatigued. So many women who wish to overcome their nervousness by the inhalation of fresh air and by exercise overdo the matter, and their last state is almost worse than the first. They walk until completely tired out, and return exhausted, having received no benefit, and then resolve that exercise is a delusion and a snare. A gentleman who was suffering from a complication of troubles, which induced extreme nervousness, but which were not of a sort to confine her to her bed, came to the city for treatment by one of our celebrated specialists. She had insomnia; could only sleep under the influence of chloral; was unable to take exercise, and had become utterly despondent. The physician told her she must take regular exercise in the open air. The patient declared it was impossible for her to walk. She could scarcely move about the house. The doctor, however, told her she must go out and walk, if it were only one block, but she must not tire herself. This advice was followed reluctantly. The first day two blocks were accomplished; the second twice the distance; at the end of a week the patient found no difficulty in walking half a mile in the park, after riding thither in the horse cars. The regular exercise soon enabled the sufferer to sleep well, and her general health was re-established.

THE TREATMENT OF FROST BITTEN FINGERS AND TOES.—Dr. Lapatin, in the "Proceedings of the Caucasian Medical Society," advises that fingers and toes which have been slightly frost-bitten, and which subsequently suffer from burning, itching and pricking sensations, should be painted, at first once, and afterwards twice a day, with a mixture of dilute nitric acid and peppermint water in equal proportions. After this application has been made for three or four days, the skin becomes darkened and the epidermis is shed, healthy skin appearing under it. The cure is effected in from ten to fourteen days. The author has found this plan very effectual among soldiers, who were unable to wear their boots, in consequence of having had frozen feet. They were, in this way, soon rendered capable of returning to duty.—*British Medical Journal*.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Operations at the Mahoney mine are delayed on account of the unsettled state of the weather. As there is but a scanty supply of wood on hand, it would hardly be safe to commence taking out water until the roads will permit of hauling, which will be a couple of weeks at least. The new skips have been taken to the mine and hung on the ropes. G. W. Horn, the foreman, has taken advantage of this delay, and has gone to his home in Sonoma county for a week. The gravel claim worked by Messrs. Strickland, Hughes and McKindly, situated about six miles above here, promises to pan out better this winter than it has done for years. The supply of free water is almost sufficient to run the claim. Every pan seems to prospect well, and everything indicates a good clean-up in the spring. Enos and Wm. Templeton, who are mining a short distance from town, came in this week with a bag full of gold. Enos carried the treasure, and Will acted as escort armed with a Spencer rifle.

AMADOR QUEEN.—*Ledger*, Jan. 30: Both mine and mill were brought to a standstill this week. A clean up was made at the mill a few days ago; the yield was not large, as considerable slate and dirt had been run through, materially reducing the average yield. The mine is idle for want of timbers and other material, the roads being too heavy to admit of any being hauled for some time to come.

MISCELLANEOUS.—The high water of Saturday last did considerable damage to the Volcano tunnel property. The recent heavy rains, giving an abundance of water for mining purposes, have given a stimulus to gravel claims around Volcano. The water wheel experiments by Knight & Co., at the Zeile mill, have resulted so far in the discovery that by using two wheels instead of one a saving of 5 per cent in the amount of water can be effected. Experiments with the Pelton wheel have not been commenced as yet.

Calaveras.

MILL.—*Mt. Echo*, Feb. 2: The mill at the Tozer mine started up for the first time last Monday. It reported as doing satisfactory work. We will particularize more fully in future regarding its pulverizing qualities. The stage plying between this place and Mokelumne Hill has failed to make its schedule time during the past week, owing to high water. It is reported that work will be resumed in the Gold Cliff mine in a few weeks.

Contra Costa.

THE CENTRAL MINE AFIRE.—*Antioch Ledger*, Jan. 30: Last Sunday morning upon entering the Central mine at Stewartville, it was found to be on fire. The fire was in the engine room, and the heat was so intense and the smoke so dense that no one could go in to see how much damage had been done or how far the fire had extended. The mine was immediately closed up to smother the fire out if possible, but when the covering was taken away, and they entered the mine to see if it was out they found it still burning. By the use of a hose to carry water to the fire, it was put out on Thursday afternoon. The necessary repairs will be made, and work will be resumed in a few days.

El Dorado.

LOTUS.—*Cor. Placerville Observer*, Feb. 2: The Mountain Peak or Hard Scabble mine, north of this place, after having been shut down for a month or so, was started up last week, and is now being worked night and day, with Bomback, Hanten and Shultz at the wheel.

GOLD ORE.—The Hale & Norcross mine, which is the southern extension of the Mount Pleasant, at Grizzly Flat, and owned by Anon Melton and Denis Gally, bids fair to prove as rich and permanent as the mother mine. The Hale & Norcross has been prospected to a considerable depth for a distance of two hundred feet, showing a well defined ledge of ore bearing much free gold, though the rock is not of the specimen character. We have a number of samples of ore from this mine on exhibition at the *Observer* office, which is open to inspection by any of our friends.

POVERTY POINT.—The Poverty Point Mill is to be started up again this week, and will be fed on ore from the diggings now being worked by Myers and ren, who are to run through about 150 tons. The mill which is a five stamp battery, is the property of Rulofson & Likens. These men some months ago visited the Point, and finding the character of the country to be principally porphyry, with an inexhaustible supply of quartz, hundreds of tons of which were on dumps ready to be hauled and crushed whenever the facilities presented themselves, were not long in concluding that a custom mill would not only supply a long felt want but would be remunerative as well. They accordingly put up a mill, one of the rotary pattern, which after repeated trials was found to work so unsatisfactorily that they immediately substituted the present and more compensative one. The first shipment of ore crushed at this mill, some two weeks ago, was from the Gentle Annie mine owned by Fred Montgomery and George Hilbert; and while the result of the clean-up was not as encouraging as the owners thought it would be, still they have not lost their confidence in that the mine will eventually develop into a desirable property. They are making preparations for another crushing which will be made just as soon as others are accommodated. We learn that Chub Napier has on hand several hundred tons of high grade ore ready for hauling. Joe White has also in readiness for shipment a large dump of ore. When the weather moderates and the roads become passable, Poverty Point will rejoice in a boom that will impress upon the people the urgency of transforming the name from Poverty to Prosperity Point.

Inyo.

AT WORK.—*Inyo Independent*, Jan. 23: A few men have been put to work in the Chulula mine. John C. Eddy has put a few men to work in one of his mines at Riley. Lasky has ten men at work in the Keynot mine; they are getting out good ore. Two carloads of ore were sent down from Elina to the Swansea furnace a few days ago. John Anton has leased the McEvoy mine and mill in Beveridge,

and will begin work in a few days. At the Union mine, Cerro Gordo, Tom Boland has about the usual number of men employed. A good deal of ore from the mine is taken to the furnace at Swansea.

Mono.

BENTON.—*Cor. Inyo Register*, Jan. 29: We love to see stuff rolling into Benton. We hope Dr. Griswold is correct when he remarked the other day that "there will be mining around Benton a hundred years hence." Should half or even a fourth of the mining claims enumerated in a late issue of the *Register* by your genial Benton correspondent prove remunerative, this farming section would be particularly benefited thereby. Most of the claims mentioned in that article are but a short distance comparatively from this valley. The entire distance from Round Valley to Millner's store, Benton, is only twenty-five miles according to the survey via the Yellow Jacket, another via Clover Patch. In case of a mining boom in that region a good wagon road would be built direct from here to Benton. It is rumored that more than one company will be operating in Mammoth next summer; also the contemplated works at Mono lake; thus will be created a new market not farward for us.

Nevada.

THE CROWN POINT MINE.—*Grass Valley Union*, Jan. 31: The station at the foot of the 180 level of the Crown Point mine has been completed during the past week, and a contract has been let for lowering the pump and putting in a skip track to the 300 level. This work will be commenced on Monday, and prosecuted with vigor. As soon as the level is free from water the drifts will be run both southeast and northwest from the shaft; and it will very soon be determined whether the ledge holds its size and richness on this level. The southeast drift on the 180 level is being driven as fast as possible, and is already in a distance of 275 feet, with a 5-foot ledge showing in the face. The rock increases in richness as the drift advances. On Friday a very rich strike was made in the slope of the 180 level, and some of the finest specimens ever produced in this district were brought to the surface. The specimens show plenty of free gold, in fact show nearly as much of the precious metal as rock, together with galena and heavy sulphurets. Some of these specimens were brought to town yesterday and attracted considerable attention, although such things are of an every-day occurrence in Grass Valley. All the machinery about the mine is working well, and many more improvements will be made when the ditch from the Idaho is completed. The Crown Point is destined to be one of the great paying mining properties of the district.

THE DEADWOOD MINE.—*Transcript*, Jan. 3: The work of repairing the old tunnel of the Deadwood mine, at Willow Valley, is about completed. There remains about 400 feet of new tunnel to make before the former workings can be penetrated at the desired point. It is expected that in running this extension of the tunnel (which is to be done without loss of time) some good bodies of ore will be opened. The stockholders of the Deadwood are resolved to put the mine on a producing and profitable basis if energy can do it.

WATER POWER FOR MINES.—*Foothill Tidings*, Feb. 2: In an interview with Mr. David McKay, last evening, he informed us that the Empire Mining Company had now completed all their arrangements for the introduction of water power at their mines. The company formed is a strong one. It will be an immense saving to the Empire Company in fuel, and will give them better power than steam. The newly organized company do not propose to stop their enterprise at the Empire, but will carry it further, so that all the mines now in the southern part of this district can have the benefit of the enterprise. Many of these mines are now closed, and have been for a number of years, just because the cost of hoisting and pumping by steam was to great an expense, and would soon eat up the profits of low grade ore. There is the Omaha, Bullion, Hartley, Allison Ranch, Franklin and others which have now slipped our memory, that will start and will be in active operation and paying dividends before another year rolls around. If the present company, now negotiating for the Allison Ranch mine, do not take it (and we seriously doubt it) the new water ditch will be a higher incentive for capital and enterprise to take hold of that mine. The new company formed to carry out this water enterprise is not composed entirely of the Empire Mining Company, as is supposed by many, but is almost entirely composed of gentlemen who have heretofore had no interest in this county. It is estimated that the cost of introducing this power will be over \$100,000. The water will be from the South Yuba Canal Company, and will be conveyed by ditch and pipe a distance of nearly four miles. The work for constructing the ditch and reservoirs will soon commence, and it is expected that by the first of May the Empire will shut off steam and turn on water. Members of the new company are expected here any day to make arrangements for carrying out the enterprise.

ORE.—*Georgetown Courier*, Jan. 28: During the year 1885 the Terrible mine produced 1,131,835 pounds of ore. A millrun of ten tons of ore was made from the Centennial mine last week. Reports are current that work will soon be resumed on the Highland Chief and Hugo lodes, on Silver creek. William and John Jay Smith are exerting their muscle on Columbian Mt. these days, developing their Nabob lode. Barrett & Fletcher's mill at Empire is running steadily. The new concentrator recently put in has not yet been tested. It is reported that the Cashier and other properties at Empire have been leased to a syndicate of capitalists with Tabor at the head. The new crushers and other machinery for the Stanton Engineering Company arrived this week, and will be immediately placed in position for operation. A millrun of 40 sacks of ore was made last week from the Queen of the West lode, in the Horseshoe. The mineral yielded as second class, 281 ounces silver to the ton. Wing & Co., lessees on the Johnson lode in East Argentine district had a millrun of 32 sacks of ore from the workings last week. The ore returned 193 ounces silver and 1½ ounces gold per ton. George Anderson, who is leasing on the South American lode, on Republican Mt. has exposed a good vein of ore. He brought down 55 sacks of ore last Saturday, which we understand milled well in silver and lead. Duncan Drummond is steadily pushing the adit ahead on the Candalaria lode on Columbian Mt. The adit is in 100 feet. This vein crosses all the main ledges on the mountain, and it is the intention of the owners

to drive the adit ahead to intersect with the Etta and other promising lodes. The developments on the John Welch lode, situated on Fall river and owned by Michigan parties show a discovery shaft and an adit on the vein about 65 feet in length, the breast of which shows a vein of auriferous quartz, about two inches in thickness. This working has steadily improved as exploration progresses.

Sierra.

MILL RUNNING.—*Mt. Messenger*, Jan. 30: Jesse Carney has now been running his quartz mill at the head of Jim Crow about a week. Everything works well. A large amount of work is being done at the Downville foundry for the Young America, Cleveland and other Sierra mines.

RUBY.—Ruby will be yet one of the largest gravel mines in Sierra county. The last week's cleanup was 143 ounces of gold. One nugget weighed 33½ ounces.

Siskiyou.

HAPPY CAMP.—*Yreka Union*, Jan. 28: Work on the Smart & Co. claim is temporarily suspended on account of a break in the ditch caused by accumulation of slush snow.

QUARTZ AND PLACER.—*Yreka Journal*, Jan. 30: The recent storms have created a lively boom in the dry diggings and hydraulic claims. Considerable gold has been realized from the high gulches and ravines, which can be worked only during such winters as the present, to furnish water at the summits of mountains. Louis Scheld is now busily engaged in working the Pellett and Scheld hydraulic claim, in Greenhorn gulch, there being an abundance of water lately, to crowd operations day and night. The Chinese Hydraulic Company, at the north end of town, is also working day and night, with a full supply of water from Greenhorn ditch. At Hawkinsville all the companies are at work, with a good supply of water from both Long and Canal gulches, and the Big ditch also furnishes a fine quota to those who have leased it. On the various creeks in Scott valley the hydraulic and placer miners are all busy raking in the gold while the warm rains prevail, to afford plenty of water in the various gulches, streams and ditches. Klamath river has been up to eight feet above the low-water mark, and the freshets have cleaned out the stream of the vast amount of tailings accumulated for several years past, which will be of great benefit for mining operations. The stream had become choked up to a great extent at many points, and could be forded very easily last summer at numerous places below and above Scott river. The miners started out a couple of weeks ago to secure poles for windgirding in the spring, but have been obliged to postpone such work until a later period, when the roads are in better condition and the ground dries up to some extent. As soon as spring opens all the claims will require a great amount of lumber and poles for windgirds, which will give employment to many men and teams.

Shasta.

PLACER AND QUARTZ.—*Shasta Co. Democrat*, Jan. 27: The late rains stopped all work at the mines on Squaw creek for the time being. Andy Fife's quartz mill at Lower Springs is running on custom rock day and night with first-rate results. We are informed that the Iron Mountain company will not be able to commence reducing ore before the first of March. As soon as the road will bear heavy loads a new quartz mill will be taken in to the Bullychoop mines. This will make four mills for that camp. Dr. Bell of Anderson owns a placer claim on Grizzly gulch from which last week he took out an ounce of coarse gold in two pans of dirt. A prospector named Decker has discovered on Bulgin gulch what is said to be another tellurium mine. The vein is a big one and the ore is said to be identically the same as that of the Salt creek tellurium mine. The mine owned by Bradberry and others of Red Bluff, situated a short distance west of the old Hall reservoir, although not attracting much attention promises to develop into a rich thing. A shaft is now down nearly fifty feet and ore continues to assay into the hundreds of dollars. We are informed that Wm. T. Coleman now owns some twenty-odd mining claims in the French Gulch district excluding the Niagara, which is yielding handsomely. On several of these locations he is running prospecting tunnels, all of which gives employment to quite a number of men at good wages. The owners of the Cressus mine on Squaw creek have succeeded in getting their engine and boiler on the ground despite the stormy weather of the past ten days. W. W. Nichols is building a wagon road from Copley into the Squaw creek mines. Heavy loads of ponderous machinery continue to be freighted through Shasta to Iron Mountain. Wm. Campbell, who was in town a few days ago, says that Mr. Ellsworth, superintendent of the mine and works, is erecting as fine and substantial works for size and capacity as can be found on any mine on the Pacific coast.

San Bernardino.

ARROW DISTRICT.—*Cor. Calico Print*, Jan. 29: Since writing you last week Arrow Mining district has had a visit from some mining experts. They came back to Providence apparently well pleased with their visit. As yet little work has been done, but what has been shown up well. The Mexicans are down about 40 feet on their mine, showing rich ore as on the surface and much more of it. The Golden Queen is also showing up well, and several other prospects are looking very nice. The owners of the Mountain Pass on the main ledge will commence work this week. The Red Cloud now shows a body of ore 12 feet wide and 150 feet in length, this claim assays very high and has a large quantity of ore in sight. A number of prospectors in this district are fetching in good gold rock every day. There is now no question but Arrow District will make a large camp.

MESCAL MINES.—Mr. W. A. Roberts has returned to this camp after examining the Oases mines; he speaks well of that country. He has left for Los Angeles and will return to Mescal in a few days to see to the working of bond on the Cambria mine. Mr. Sim Barrett has not returned yet from the green fields of San Bernardino; the pasture must be good in there.

IVANPAH MINES.—Messrs. Miller & Van Winkle had a crushing from the Alps mine. The boys have met with deserved success. Some of their ore pulped over one thousand dollars a ton. Van says that the green fields have no attraction compared with the glittering silver coin. Messrs. McFarlane & Barrett have been running during the week and turned out some nice silver bars. Two miners are working

on a lease on the old Consolidated mines. Winters, an old time Ivanpaher, has bought the Eugene mine and is meeting with success, having struck some rich ore. There are several other chloriders working at various mines, some doing well others making a stand off.

NEVADA.

CHOLLAR.—The tank at the 3100 level of the Combination shaft being completed, the pump column is being built up from that point to meet the Cornish pump on the 2900 level. This will be completed and in pumping operation by Wednesday next, after which sinking the shaft deeper will be taken into consideration. No other work is being done in connection with this mine at present. The heavy stone bulkhead on the 2800 level, 70 feet south of the Hale and Norcross south line being fully completed, was closed on Tuesday last, and the drift behind it allowed to fill. No water at all comes from that point where fifteen or twenty inches came before, being a relief to the big hydraulic pump of about 300,000 gallons per day.

OPHIR.—On the 300 level the west drift from the old Mexican shaft is now in 76 feet, 27 feet having been advanced during the week. Material vein porphyry with streaks of decomposed quartz. On the 700 level the progress of the joint Mexican and Union drift running northwest from the Ophir shaft is described under the Union Consolidated head.

CON. CALIFORNIA AND VIRGINIA.—About 300 tons per day continues to be the daily yield, which is reduced at the Morgan and Eureka mills, assaying a little over \$15 per ton. On the 1530 level the north-west drift towards the old bonanza stopes is in 508 feet, advancing at the rate of about 30 feet per week. The west drift on the 1400 level is in about 212 feet, advancing in good working ground.

KENTUCK.—Owing to the damage to the roads, hauling to the mills from this mine has had to be suspended, as well as the extraction of ore for the present. It will be some time yet before hauling to the Rock Point mill on Carson river, below Dayton, can be resumed, as the road which 'follows the bed' of Gold canyon at its lower end was destroyed by the recent flood and made impassable for teams.

SIERRA NEVADA.—The main north lateral drift on the 520 level has now attained a total length of 1620 feet, 56 feet having been added during the past week. The material is principally vein porphyry with streaks of clay, but little or no quartz. It works very favorably, allowing of a very good rate of advancement.

UNION CONSOLIDATED.—On the 500 level the main east crosscut is now in 546 feet, and making good advancement in favorable working ground. On the 700 level the joint Mexican and Union drift running northwest from the Ophir shaft, is now in 211 feet, and progressing at the rate of about 40 feet per week.

MEXICAN.—The lateral drift north from the east crosscut on the 500 level was extended 30 feet, making a total of 392 feet. Material, vein porphyry, with some little clay and quartz. The progress of the joint Mexican and Union drift on the 700 level is given in the Union Consolidated portion of this report.

CROWN POINT.—Some of the mining force had to be laid off for a few days, owing to the heavy storm, which impeded ore transportation and milling, but all are at work again, and the daily amount of ore extraction is up to the former standard.

ALTA.—The lateral drift north toward the Benton ground continues its steady rate of advancement. Material, vein porphyry and quartz, with streaks and bunches of low-grade ore.

MISCELLANEOUS.—The small outside mines and mills in Six-Mile canyon, which were stopped by the recent heavy storms, are all at work again.

Columbus District.

HOLMES.—*Candelaria True Fissure*, Jan. 30: We are preparing to do some work in the old 6th level during the present week in a prospect that we think will extend down and connect with the ore body near eastern end of 9th level. The stope 60 feet below the Morris ledge well. This stope has been very large for a long time, and it is now larger and stronger than ever. It is 80 feet long and looks exceedingly well. In the 8th level we are stopping in the Morris ledge. The stope is 150 feet long and is larger and better than at last report. This is a very productive stope. It will average 4½ feet wide for 150 feet in length. It is all good milling ore and goes to the mill as it is broken from the stope. In the eastern ore body on the 9th level we are stopping in the ledge above and below the level. We are running a drift from this stope toward the foot wall on a small streak of ore that assays very high. The foot streak still keeps up its north and south course, and will doubtless extend from hanging to foot wall. The ledge at this point is about 220 feet wide, and there is no place in the mine that looks more favorable for large and extensive ore bodies.

BICYCLE.—This is a new find, located by J. L. Callison. It is situated east of the Silver Boy. A shaft has been sunk on the ledge about 8 feet, where it shows a width of 4 feet of ore that assays \$118 per ton in silver. The formation is granite and porphyry, and the mine has an appearance of permanency. Mr. Callison feels very much elated over his prospects.

GENERAL GRANT.—William Dunlap is sinking on this mine. He is now down about 15 feet, and the ore improves as depth is attained. It is the intention to sink 100 feet before crosscutting. The ledge is about 14 feet wide and will work about \$25 per ton.

PROPOSE TO STAND IN.—A number of the chloriders are stacking their ore on the dumps to await the starting up of the new mill. They 'propose to stand in with home industry. That's right, boys.

CLIMAX.—Kent & Co. are still driving their new tunnel. They are now in 200 feet, having made 20 feet since last report. They expect to cut the ledge in a few feet.

Gold Mt. District.

STATE LINE.—*Candelaria True Fissure*: This property, located in Gold Mountain mining district, in the southwestern corner of this county, is again coming to the front, this time as a bullion producer, instead of a stock speculation. A new corporation called the State Line Consolidated Gold Mining Company, of New York, has taken bold and con-

solidated the different claims known as State Line Nos. 1, 2, 3 and 4, with the capitalization reduced to one-fourth. Thirty-six of the forty stamps in the mill are working during daylight hours and several very satisfactory bullion shipments have already been made. On the first level, where the old company quit work, thinking that they had lost the ledge, on account of a change in dip, good ore is being taken from both sides of the incline. At the depth of 186 feet a second level was opened and a crosscut started for the ledge in new ground. It struck the vein in far richer ore than any that had been developed above. The crosscut shows 18 feet of good milling ore. An upraise has been driven 54 feet, all in high-grade ore. A west drift has been run 50 feet, and an east drift 80 feet, and the ledge still holds out as good as where encountered. The upraise and the drifts have opened the ledge in fine condition for stoping, and enough ore is now in sight to run the mill to its full capacity for many months. The main incline is down 280 feet. The company has a large amount of wood and other supplies on hand, and the water supply is practically unlimited. There are 23 men all told about the different branches of work. Operations will shortly be begun on full time.

CALICO.—*Print, Jan. 29:* Some very rich ore is being taken out of the Waiho mine. Several chlorides have leases on the Bismark mine: some of them are taking out very good ore. The Jessie Tay and Rosebud have been bonded and leased to Messrs. Waterman & Porter, who have ten men taking out ore. The Blackfoot mines are once more being worked by chlorides. Some specimens taken from this ground have been shown your correspondent, running 600 ounces to the ton; the mines show up good mineral in several places.

JACKSON DISTRICT.

A MILL.—*Silver State, Jan. 30:* Jackson mining district, which was organized a year and a half ago, is assuming considerable prominence. George Clark, who left there a few days ago, says they expect to have the mill completed early in March. At present they are short of powder, and not much is being done in the mines. A saloon is to be opened there next week, and a barrel or two of whiskey was shipped there from Mill City this week. This is expected to stimulate prospectors, and new mining discoveries may be looked for before the Ides of March.

PEAVINE DISTRICT.

THE PEAVINE PROCESS.—The new process adopted for working the refractory ores of Peavine mining district, west of Reno, is described as follows: A new process for separating gold and silver from the baser metals, it is said, has been tried at Peavine with astonishing results. The ore is roasted in a furnace, then treated with a chemical fluid which separates the gold from the silver and both from the gangue and baser metals. A three-ton furnace and vats for treating the roasted ore have been erected at Peavine, and it is claimed that the refractory ores of that district are worked up to 85 per cent of their assay value, and the gold and silver is over 900 fine. The cost of treating ores by this process does not exceed \$3.50 per ton where fuel is not too high.

TUSCARORA DISTRICT.

GRAND PRIZE.—*Tuscarora Times-Review, Jan. 27:* Two hundred east lateral drift extended 26 feet, and 200 north drift 16 feet. No material change in the mine.

BELLE ISLE.—The past week have suspended work in east crosscut No. 2, 450 foot level, and resumed in the face of the north drift from east crosscut No. 1, same level.

NAVAJO.—No. 1 upraise on east lateral vein 350 feet level carried up a total height of 30 feet, south drift from east crosscut 250-foot level extended 11 feet east crosscut No. 2 same level extended 3 feet. Have started up and extended the Belle Isle and Navajo joint crosscut same level 15 feet.

WASHOE DISTRICT.

HALE AND NORCROSS.—*Enterprise, January 30:* Sinking the deep winze below the 3100 level constitutes about the only work being done in this mine at present, all forces being concentrated at that point. Last evening it was down to the depth of 97 feet below the floor of the 3100 level, having about 30 feet yet to go in order to reach the 3200 level. As this winze has been sinking at the unprecedentedly lively rate of 35 feet per week, it is easy to see that sinking but another week or less will carry it to the 3200 level. The ground is dry and works favorably, hence the excellent progress made in sinking. The Cornish pump has not been lowered, but a column is being built upward from the tank on the 3100 level to join the main Cornish pump above, connecting with it on the 2900 level. This pump will be completed and ready to start up by Wednesday next, after which sinking the shaft deeper will be in order.

GOULD AND CURRY.—All work in this and the Best and Belcher mine is concentrated entirely upon the proposition of draining the Osbiston shaft owned jointly by the two companies. The powerful surface machinery recently started into operation after nearly a year's rest, continues to work smoothly and effectually. The repairs to the shaft are made and the new pump tank on the 1600 level completed. Pumping was commenced last Monday and the water in the shaft is rapidly being reduced from its original depth of 837 feet. The shaft is 2700 feet deep—200 feet deeper than our local contemporary makes it—therefore it will take several days, perhaps weeks, before the shaft can be thoroughly drained.

ARIZONA.

LONGFELLOW.—*Clifton Clarion, Jan. 26:* But little development work is being done at present, nor is any of consequence being extracted. A small force of men are engaged in timbering and getting the ground in shape for extensive exploitation and extraction of ore. The company is preparing for a vigorous summer campaign, and the output for 1886 will be something handsome. The management of the property is all that could be desired, and would be difficult to improve upon. Immense quantities of ore are on hand, but awaiting the magic touch of the miner's pick to fall—and be converted into the merchantable article. At the Metcalf things move on in the even tenor of their way. The Little Annie is producing considerable quantities of high-grade ore.

WHITE HAWK.—Seventeen men are employed in getting out a medium fair grade of ore, yet not quite

so rich as that in the Annie. A tunnel is being started in, under the cut, to tap large bodies of ore supposed to exist further in the hill. This claim, with the others of the Metcalf group, at present working, employs together about seventy men. The King, Coronado and Queen mines will start up whenever the demand for copper will justify.

MORENCI.—The site is being graded and prepared for the concentrators immediately adjoining the smelter. The same power will be utilized in running the concentrators that is now employed at the smelter. The old concentrators are being taken down, preparatory to their removal to the new location. The smelter is running smoothly, and is turning out from 10,000 to 13,000 pounds of bullion daily. But a small force of men are employed in and about the smelter, and everything is conducted in a quiet, business-like manner. The Postoffice commands no small share of attention. About 150 men are employed at present.

Mr. Alex McLean, the foreman of the works, was too busily engaged at the time of our visit to devote much attention to the pencil pusher, but we promise to see him again, at some more opportune moment, when lost time can be made up.

GLOBE.—*Cor. Silver Belt, Jan. 23:* The Mayflower mining claim, owned by the Epley Brothers and J. L. Bichelder, is located on the northeast slope of the Quartzite mountain, a few hundred feet west and parallel to the Silver Fame, has had considerable surface work done by running tunnels and open cuts. The ore found here is similar in character to that of the Silver Fame, some of which is very rich. The Hartford and London mines, formerly the Silver Era and Etna, owned by Eastern parties, are situated about eight hundred feet west and parallel to the Mayflower. It has produced thousands of dollars and sent one or two men to Europe on tours of pleasure. The work so far done here consists of several irregular gashes in the crest of the hill, and the greatest depth reached does not exceed 75 feet. There is, to the best of my judgment, from 250 to 300 tons of ore on the dumps that will yield from 40 to 50 ozs. of silver per ton. The ores are free-milling, and with a mill conveniently located they could be reduced at a handsome profit. The Home Ticket mine, owned by E. L. Winterburger, F. F. Burke and J. B. Henry, is located on the southwest slope of the Quartzite, about one-fourth of a mile from the mines above described. This property has had a large amount of development done, consisting of one tunnel 120 feet in length along the ledge, and a winze midway in the tunnel down to a depth of 50 feet, which exposes a vein of ore throughout the entire workings, from eighteen inches to three feet wide. There is already on the dumps about sixty or seventy tons, that will yield without assorting 100 ozs. of silver per ton. The Arizona Central mine, owned by Dr. S. C. Heinemann, is situated six hundred feet east of the Ticket. It has had considerable surface work done, and has produced some exceedingly rich ore of a like character as that of the Ticket and Fame, and has several tons of ore of good grade on the dumps.

COLORADO.

ELK MOUNTAIN.—*Pilot, Jan. 30:* During the summer we expect to see a smelter erected here. We consider the mines far enough advanced in development, and with a good road to reach the ores of Aspen, everything is ripe for a smelter at this point. With the coal and coke, water and timber, iron and lime rock, coupled with the various kinds of ores mined right at our doors, it is certainly reasonable that the silver should be extracted here, which can be done, and save waste rock freight, and give a market for a much lower grade of ore than can be shipped to market at the present freight rates. We believe that by spring the proper parties with the experience and means will be on hand to build the much needed smelter. Mr. Metzler will start his mill on Monday, and run a 100-ton lot of Queen ore. He has been constantly improving his mill until he certainly has a model one. When Mr. Nichols took charge of it six months ago it required from ten to fifteen men to run it twenty-four hours. It now requires but three men to run it the same length of time. Garrett Fitzgerald was down from Redwell Basin this week. He reports the basin filled up with slides even with the rim.

MONTANA.

INDEPENDENCE DISTRICT.—*Butte Inter-Mountain, Jan. 29:* Near Burlington, the mining center of Independence district, there is considerable mining being done in a quiet way, the results of which promise well for the future of that vicinity. Recently lessees and purchasers have demonstrated that the mines improve with depth, at least as far as they have gone. In nearly every instance the ore has improved in quantity and quality below the water level. From all we could learn from observation, and from details given by those who should know whereof they spoke, the veins seem as large and as rich as those in the more developed districts in the immediate vicinity of Butte. The principal mines that are being worked in the district at present are the Blue Bird, Burlington and Nettie. There are quite a number of others on which lessees are working in a small way.

THE BLUEBIRD.—The main shaft of the Bluebird mine is 400 feet deep. A crosscut is being run from the bottom to cut the main vein, which will be reached within 40 feet from the present heading. They are driving this cut at the rate of four feet a day. The 300 foot level is also being worked. No stoping is being done as the intention is to develop the property and then determine upon the best method of disposing of the ore; perhaps works for its reduction may be erected in the vicinity of the mine. At a depth of 200 feet a level has been driven east 300 feet, where it connects with a tunnel which has also been run on the vein for a distance of 300 feet. A level 325 feet in length runs west from the main shaft at this (200 foot) station, making a total of 925 feet along the vein that has been opened underground, and throughout this distance the levels have been in ore. Besides the main one there are three other shafts on the lode, respectively two hundred, one hundred, and forty feet deep, which demonstrate the continuity of the vein for a distance of 1,300 feet along the surface.

THE NETTIE.—The lessees on the Nettie have only been working three weeks and have had trouble with their machinery and with water, so that they

are only now getting fairly started. Their shaft is 150 feet deep. The ore raised from the 60 and 100 foot levels and stopes has been at the rate of about 100 tons a month.

THE BURLINGTON has been traced for some distance by its outcroppings, and has several shafts. The main one, where Messrs. Edwards & Co. are working, is 150 feet deep. At this depth they are driving drifts east and west; the former being about 130 feet, and the latter 60 feet in length.

MISCELLANEOUS.—Messrs. Rodda & Odgers have a lease on the Fredonia. They are down about 100 feet. They hoist with a whim and are shipping ore regularly to the mills. The I. X. L. is also being worked by leasers. The Occidental has a shaft 75 feet deep, from which the lessees, Messrs. Connors and Colonel Thornton, are cross-cutting to reach the vein. Blodgett & Hannaker are sinking on the Sarsfield lode. They are now down 78 feet. The Silversmith lode, north of the Alice, is leased and being worked. The shaft is 90 feet deep. Here also they are cross-cutting for the ore vein, which they expect to reach in about ten days. The Arlington company has begun work on the Star of the West. At the Golden Rule the new boiler is in place, and sinking is resumed with three shifts. The lower levels are being continued east and west from the shaft, and stoping will begin in a few days. About 20 men are employed at the mine. The Azure is a continuation (east) of the Bluebird. It has a shaft upon it about 80 feet deep. The Mono is near and parallel to the veins just mentioned. There are two shafts on the lode about 75 feet deep. The ore is rich in manganese.

NEW MEXICO.

ORE.—*Silver City Enterprise, Jan. 29:* Twelve tons of 69 ounce ore was shipped from Jimmy Percell's Little Fat Man mine at Cook's peak last week. The ore is of a very desirable class and is sought after by the ore purchasers throughout this section. The mine promises well for the future. The Flower Queen, at Cook's Peak, sent six or seven tons of fine lead carbonate ore to the Denning smelter last week. A new strike of horn silver and sulphide is reported upon the Old Man mine. The discovery was made at the deepest point that mineral has been found upon the lower west tunnel. Two shifts are at present employed by Bernard McDonald upon the Red Cloud mine at Bullard's peak and they are getting out a fair grade of ore in quantity. Joe E. Sheridan has been in town during the past week, figuring upon the mill to be erected by the Sheridan mining company, at Cooney, and awaiting advices from his company. Everything is working satisfactorily and most encouraging reports are coming in from the mines, where a small force of men are employed in developing the property. Kingston, the rich camp of Sierra county, is keeping up its reputation handsomely. Among the recent new strikes there is one made by Captain Burns on the Uncle Jack mine. The ore body is said to be immense and of a good grade. Several carloads will be shipped from it shortly. Capt. Burns was the pioneer mine developer of Kingston, and his friends will rejoice with him at his good fortune. Thos B. Pheby informs us that connection was made between the upper and lower shaft of the Satisfaction mine, at Georgetown, Tuesday. The air has been very bad in the workings of this property for some time, but now the most perfect ventilation has been secured by the tunnel connection. A very rich strike is reported in the 60-foot level of the third shaft of the Cooney mine. A sample of the ore was taken, and the returns show 300½ oz silver and 17 oz gold. The ore is a copper pyrites and a grey quartz, and shows fully five feet between the walls. This new discovery is located south of the immense chimney that has produced such large quantities of ore, and is but 150 feet from the surface. North of the point from which this sample was taken but one wall has been encountered. The lead will be tapped from the first level as soon as the diamond drill now on the road arrives. This is the most important find made on the Cooney for many months.

OREGON.

JOSEPHINE CO.—*Courier, Jan. 29:* Desselles & Connell on Scott's Gulch, near Waldo, are pushing things lively with a giant. Mr. Havelin on Canyon creek is also tearing away dirt at a rapid rate with a giant. We are informed this is a splendid claim. All the mines on Althouse and its tributaries are running—some of them night and day. This will be a glorious season for Josephine miners. During this winter and last fall, prospecting for both placer and quartz mines in the county has been carried on more extensively than for some years past. We expect to hear a good report from Mr. Cliff Smith of this place, who is working a claim on Foot's creek. Cliff is full of energy and deserving of success. A contract has been let for a 200-foot tunnel on the Jewett ledge near Grant's Pass. As development proceeds on the old stand-by, it becomes more evident that the owners have a good property. Wm. Bybee's famous claim, producing a fine character of gold, on the head of Allen Gulch, near Waldo, is running one giant with every indication of a very profitable clean-up at the end of the season. Negotiations are pending for the purchase of J. T. Layton's claim on Applegate by a Chinese company of Portland. \$65,000 is the amount asked by Mr. Layton, and the mines are well worth it. John Hall is superintending Hall & Bybee's placer on Canyon creek. He is running one giant, and making the best of the season so far. They have abundance of water, and the promise of a grand clean-up when the streams run dry. Last week Joe Scott, who is interested with B. McNair in the gravel claim on Rogue river near the Big Yank, showed us two ounces of excellent fine gold from that bar which indicates that if it was worked with a hydraulic, it would pay handsomely. Simmons & Ennis, near Waldo, are running a cut from the Illinois river, intended for the purpose of developing their ground and getting into Shelly gulch. Next year these gentlemen will, no doubt, make some startling discoveries, as the dirt gives every indication of being rich. Mr. Henry Smith and E. F. Everitt of this place have a claim on Foot's creek on which they are ground sluicing with good prospects. J. Wimer & Sons are running two huge giants on their famous diggings—night and day. Mr. Geo. W. Wimer, the energetic superintendent, is vigorously pushing the work with eight men, and a very large yield of the "precious" will undoubtedly

be the result of this season's work. The Dry Digging northeast of Grant's Pass are no longer "dry," but every little gully is overflowing with water, and several parties are ground sluicing with good pay. These diggings can always be relied on for a "stake" when the season is propitious. The present is one of them, hence all the boys in that section are happy. On Myrtle creek some work is being done. This district, we are told is termed as being "spotted," but when the boys do get "on to it" they "strike it rich." All the miners on Cow creek are getting down to business in earnest. Some of the mines which have not been worked for some years are now producing well. John Catching and sons, we are informed by a gentleman from that section, are working their claim near Riddle, and up to this time have taken out over \$600. The *Courier* has information to the effect that the owners of the several mines on Coffee creek are working the ground with better indications of a profitable season's run than for some time heretofore. Marrian & Sands have well developed claim on Cow creek, near Glendale. They are running a hydraulic and taking out good pay. These gentlemen, we are told, have every indication of a large profit over all expenses this season.

UTAH.

REVIEW.—*Salt Lake Tribune, Jan. 29:* The week has been a stormy one, and the roads are almost impassable. But the movement of the metals has been fair. No special mining transactions have distinguished the week, but the snow-slides have been a terror. The great slides in Bullion Gulch, Idaho, and the more recent one in Thayne's Canyon, near Park City, Utah, have been fully described in the current news of the day. In the latter, four men perished. The receipts of bullion and ore in this city for the week, ending January 27th, inclusive, were as follows: Bullion \$78,936.55; ore \$53,470; total \$132,406.55. For the previous week, the receipts were \$130,458.27, of which \$9,048.27 was bullion and \$38,410 was ore. Fine bars of bullion received during the week were valued at \$38,852; base bullion at \$3,200. The Hanauer smelter produced during the week seven cars of bullion, \$19,580; the Germania, six cars, \$17,304.55. Ore receipts were \$6,200 from the Crescent, and \$47,270 miscellaneous, including ores designated as "silver and lead." The Ontario opens the year with the declaration of the usual monthly dividend of fifty cents a share, payable in New York on the 30th. Total of dividends to that date inclusive, \$7,100,000. The receipt of five cars of ore from the Horn Silver, marks the era, probably, of resumption of activity in that great property. The news from the mine is meager enough, and is kept so, but there seems to be no reason for doubt that a large body of ore has been tapped from the new workings.

LEACHING PROCESS AT SILVER REEF.—*Cor. Pioche Record, Jan. 26:* Including teamsters, wood-choppers, coal-burners, mill-hands and miners, there are between 350 and 400 men at work in and around Silver Reef, and if plans for contemplated enterprises are carried out, as expected, this force will be doubled within this year.

The great problem that our mining men have been trying to solve is a process by which low grade ore can be worked to an advantage, for without exception there is more of this character of silver rock in sight on the dumps and in abandoned stopes in this district, than there is in any one mining camp on the coast. You can pick up a piece of country rock anywhere on the Buckeye or White Reef that will assay from three to four ounces, while there are thousands of tons of ore scattered through the waste dumps in camp that will sample 15 ounces per ton. The Stormont and Christy companies have been working ore right along during the past year that does not average 15 ounces, while until a few months ago the chlorider could get nothing for rock that went less than \$30, as the mills of the present two companies were the only place in this part of the country where custom ore was crushed. Since the new leaching works have been nearing completion, however, the Stormont and Christy companies have been offering better terms to chloriders, as many of them were piling up their ore on the dump, and holding it in reserve until such time as the new leachers operated.

The new leaching works will have turned on steam by the time this reaches you, when its progress will be carefully noted by our resident mine owners, who devoutly wish to see it succeed. The new plant is located in the old Leeds mill building, about a mile from town. The leaching and precipitating tanks are made of California redwood, and the other part of the apparatus is constructed from the best quality of material. The tanks have a capacity of a hundred tons of slimes, and the managers are confident that they can easily handle seventy-five tons of ore every twenty-four hours. The company has been working tailings during the last year, in comparatively small works, with such success that they were induced to erect this new leacher on a grand scale. The Russell process will be used, as the managers have during their past experience found out its advantages, and obtained the sole right of using it in this country.

THE BURNT RIVER MINES.—*Portland Oregonian, Jan. 22:* Mr. Alexander Mayer, one of the principal shareholders, was yesterday elected president of the Burnt River Mining Company. Mr. Wm. B. Fisher, the well-known California mining man, is now making a careful examination of the property of the company, and the development of the mines, which will be vigorous and extensive, will probably be made under his direction. The "M. W." mine, lately purchased from J. F. Watson by A. G. Ellis, has been transferred to the company. Mr. M. J. Sweeney, who was sent to Burnt River by the Hendy Iron Works, of San Francisco, passed through Portland on his way home. Being asked to express his opinion as to the value of the company's property, he said: "Any of your mines on Gold Hill are good enough to boom the best camp in California. I'll take what stock I can pay for and advise my friends to do the same. You've got the stuff, lots of it, and it's very easy to get at. If you have a good mining superintendent and a competent mill man, you ought to be earning good dividends right from the first month's run of the mill." The contractors on the cross-cut tunnel to the Oriental have struck stringers of rich ore, and report that they are within 20 feet of the main ledge. The funds of the company are being expended only for improvements and development.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont Street, San Francisco.

Manufacturers of NEW and Dealers in SECOND-HAND

Boilers, Engines and Machinery of Every Description.

PORTABLE ENGINES AND BOILERS

On Skids.

Each engine is fitted with a governor, steam and water gauges, heater, flue brush, waste, blow-off cocks, brass whistle, smoke stack with spark arrester, oil cups, gauge cocks, combination check and stop valve, and pump. Both boiler and engine are fitted in complete running order, and are sold either mounted on strong wheels with wide tires, or on skids.

STEAM PUMPS

OF ALL MAKES.

Mining Pumps.

Quartz and Sawmill Machinery.

AGENTS FOR THE SALE OF

"Cummer" Automatic Engines,
Porter Man'g Co.'s Engines and Boilers,
Blaisdell & Co.'s Machinists' Tools,
Hot Polished Shafting,
Baker Rotary Pressure Blowers.

CLERK GAS ENGINES.

RELIABLE,
ECONOMICAL,
SAFE,
STEADY,
COMPACT.

NO BOILER,
NO ENGINEER,
NO COAL,
NO ASHES,
NO DANGER.

These Engines are eminently serviceable for use as motors for Printing offices, Workshops, Laundries, Factories where sewing and bag machines are operated, and in Hotels, Public Institutions, and Private Buildings where pumps, elevators, or electric lighting machines are in use; and generally in Cities and Towns (where gas is obtainable) for all mechanical purposes requiring small driving powers.

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.

E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. This, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

PELTON'S WATER WHEEL.

THIS WAS ONE OF THE FOUR WHEELS TESTED by the Idaho Company at Grass Valley, Cal., and gave 90 2 per cent., distancing all competitors. Send for Circulars and guaranteed estimates.

L. A. PELTON,
Nevada City, Nevada Co., Cal.

AGENTS—PARKE & LACY, 21 and 23 Fremont Street San Francisco, Cal.

American Exchange Hotel,

SANSOME STREET,

Opposite Wells, Fargo & Co.'s Express, one door from Bank of California, SAN FRANCISCO.

This Hotel is in the very center of the business portion of the city. The traveling public will find this to be the most convenient as well as the most comfortable and respectable Family Hotel in the city.

Board and Room, \$1.00, \$1.25 and \$1.50 PER DAY, ACCORDING TO ROOM.

Hot and Cold Baths Free. None but most obliging white labor employed. Free Coach to and from the Hotel.

MONTGOMERY BROS., Proprietors.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manu-
facture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under
the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.
Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our
**IMPROVED
HYDRAULIC
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT
instead of two. It is of greater capacity and more easily worked and
kept in repair. The statement of Mr. Hendy that all styles are infringe-
ments on the machines made by him, he knows to be utterly false. All
litigation has been in reference to old style two jointed machines, which
are superseded by our new style one jointed. The decision of Judge
Sawyer, referred to by him, is carried up on appeal to U. S. Supreme
Court, with absolute certainty of a reversal in our favor. Send for
Circulars and Price List. HOSKIN & CO., Marysville, Cal.

JAS. LEFFEL'S TURBINE WATER WHEEL

"The Old Reliable,"

With Important Improvements, making it the

MOST PERFECT TURBINE NOW IN USE,

Comprising the Largest and the Smallest Wheels, under both the Highest and
Lowest head used in this country. Our new Illustrated Book sent free to those
owning water power. Those improving water power should not fail to write us for
New Prices before buying elsewhere. New Shops and New Machinery are provided
for making this Wheel. Address

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over
other Valves and Gate Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impos-
sible to make them tight except by regrinding, which is expensive if done by hand, and if don-
by machine soon wears out the valve, and in most cases they have to be dis- connected from
the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is
manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited.
To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MOWING MACHINE.—Benton Elmore, Shasta, Shasta Co. No. 334,762. Dated Jan. 26, 1886. This invention relates to certain improvements in mowing machines, and it consists in certain details of construction difficult to describe clearly, without the aid of engravings.

WASH BOILER.—Gottfrid Bergenheim, South Butte, Sutter Co. The invention relates to that class of wash boilers, in which a vertical passage communicates with the lower portion of the boiler and rises to near its top, whereby a circulation of water is effected. The new boiler consists of a combination of devices, so as to provide a more simple and effective wash boiler of this class.

GATE.—Thomas Depp, Moore's Station, Butte Co., and Edward H. Selby, Marysville, No. 334,516. Dated Jan. 19, 1886. The invention relates to that class of gates which are adapted to be opened and closed by the passing traveler without the necessity of alighting from his vehicle or conveyance, and especially to those gates which, by means of suitably directed ropes by the roadside, have their latches raised and are swung to an open or closed position. There are several novel features in this invention, the object being to provide a simple and effective gate of this class.

GRADING LEVEL.—C. Willganz, Little Stoney, Colusa Co. No. 334,149. Dated Jan. 12, 1886. This surveying instrument is used for determining the grade of land. The invention consists in a stand or tripod, having attached to it a fixed gauge-leg and a plumb, by which the perpendicular between the ground and the top of the stand remains constant, and in a suitable level, supported by a tripod, and having sights upon it, one of which is vertically adjustable for determining accurately the amount of grade necessary for a given work in a certain distance. The object is to provide a surveying instrument, by which the user can readily determine whether one point is lower or higher than another, and the difference between them, and can also accurately indicate and determine the amount of grade necessary for a given work, or for a ditch from one point to another.

Mining Share Market.

Although they have commenced actively pumping the water out of the Osiston shaft of the Gould and Curry and Best and Belcher Companies, on the Comstock, it has not had much effect on the stock market here. The shaft has been repaired and put in good working trim, and its complete drainage to the bottom is merely the matter of a short time, when sinking the shaft deeper for a level corresponding with the 3200 of the Combination shaft will be actively commenced. The sinking of the deep winze below the 3100 level of the Hale and Norcross is also a feature of important interest in the deeper workings of the Comstock. This work has been pushed forward at the very lively rate of about 35 feet per week, and in a few days more will reach the 3200 level. Extraordinary good progress has been made in sinking this important winze, and it will reach its destination, the 3200 level, before the Combination shaft does. The Corliss pump in this shaft has been completed to its connection with the new tank constructed on the 3100 level. The sinking of the shaft for the 3200 level can soon be actively resumed under the most favorable auspices, having only 55 feet further to go to reach that desirable point.

Bullion Shipments.

Richmond Con., Jan. 28, \$19,801; Oro Grande Mill, 30, \$3477; Odessa Mill, 30, \$3720; Koebig's mill, 28, \$500; from French Gulch (for December) \$2000; Moulton, 27, \$11,968; Alice, 27, \$22,214; Lexington, 27, \$23,872; Germania, 24, \$5609; Hanauer, 24, \$7880; Germania, 28, \$5190; Hanauer, 28, \$2600; Germania, 30, \$5151; 31, \$2574; Hanauer, 31, \$3040; Stormont, 31, \$4000. Following were the ore and bullion shipments from Salt Lake City for the week ending Jan. 31: Twenty cars of bullion, 481,494 pounds; seven cars of ore, 106,910 pounds; one car of copper ore, 23,400 pounds.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

The Montana Mining Company, formerly known as the Drum Lummon property, has declared an interim dividend of 37 1/2 cents per share, payable in London.

To Young Men and Young Women.

All competent boys and girls should prepare themselves for usefulness in business if they wish to "step up higher." We have for sale to such, on easy and favorable terms, a scholarship in one of the best business colleges in the U. S. Address this office.

And in accordance with law, and an order of the Board of Directors, made on the 22nd day of December, 1885, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Company, room 4, No. 309 California street, San Francisco, California, on Monday, the 15th day of February, 1886, at the hour of 2 p. m., of said day, to pay said delinquent assessment thereon, together with costs of advertising

**Dewey & Co.'s Scientific Press
Patent Agency.**

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

**BRETT'S
Oxidizing and Chloridizing
FURNACE.**

A Continuous Furnace for Working the
Most Rebellious Ores.

For full description of this furnace see MINING AND SCIENTIFIC PRESS of Jan. 30, 1886, or address the inventor for circular.

The main features of the furnace are as follows: The self-discharging dust-chamber and automatic return to the cylinder when not sufficiently chloridized. A saving of a large percentage of salt. Saving in weight of cylinder, which is short, as the greater part of the sulphur is eliminated in the stack. There is less volatilization by desulphurizing without salt. A higher percentage of chlorination can be obtained by first desulphurizing, as shown in the report of the Navajo mine, at Tuscarora, Nev. The separate fires give opportunity for perfect control of heat, making it easy to roast the most rebellious ores. By the constant motion of the pulp while being desulphurized, there is no danger of matting. The combination of flues and dust-chamber makes the construction comparatively cheap.

**KENDALL'S PATENT
QUARTZ MILLS.**

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are now enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past five years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that claimed for it and give entire satisfaction.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Golden State and Miners' Iron Works.

\$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embores), similar to the Triumph, the Frue Vanning Machine Company owns the Embores patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement. The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them. Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for. N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

RANKIN, BRAYTON & CO.,
BUILDERS OF,
MINING MACHINERY.

San Francisco: Chicago: New York:
127 First Street. 109 N. Clinton. 115 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES. We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER OF INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished in order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY OF CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES THE BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Aid for Boys and Girls.

The engraving on this page represents the new building of the Boys' and Girls' Aid Society of this city. This society is the only organized enterprise west of the Rocky mountains, whose exclusive work represents the most advanced thought of the age, on the treatment of dependent and erring children. Education in the family, individualization (Natura's process) as opposed to institutional machinery (mechanical measures), are its central ideas, based on the truth that "it is wiser and less expensive to save children than to punish criminals."

The Boys' and Girls' Aid Society was organized in 1874, to pursue in this city and State the methods of child-saving, so strikingly successful in New York City, in the case of the Children's Aid Society. With that conspicuous model before it, modifying its efforts as required by the changed conditions here, the Aid Society has quietly and steadily kept to the work. It has never received a support adequate to its needs, but neither has it ever been without firm and generous friends, full of faith in the value of its work, and determined that it should live till it demonstrated to the community its necessity, and compelled a respect that should insure its proper support. The society rescues homeless, neglected or abused children of California, and receives juvenile offenders (by legal commitment or otherwise), who are in danger of being sent to prison (see annual report, for Probation Law and Form of Commitment); provides for such until suitable homes, or employment and guardianship are found for them, and continues a systematic oversight of their condition and treatment; maintains a day school, a sewing school, reading-rooms, library, baths, and a class in music. Lodging and board are furnished at a nominal charge to working boys and girls, who are without homes in the city. The work is absolutely free from sectarianism, and depends upon voluntary contributions for its support.

The engraving shows the exterior of the main building for the new home of the Aid Society. It was planned by Mr. Clinton Day, architect, and was the gift of Mr. Charles Crocker. Mr. J. G. Fair donated the lot on which the building is to stand, and the late Mr. Sharon donated \$4000 to assist the cause.

This main building is planned to hold about 120 boys, properly classified as to age and condition. On the ground floor will be a main dining-room, officers' dining-room, kitchen, store-

room, pantries, closets, coal room, bath room for boys, with large circular tank, lavatory and workshop.

The first story contains offices, parlor, large assembly (and school) room, two or three bedrooms, a bath-room, and two dormitories where the girls will sleep till the "girls' building" is donated.

The second story is divided into dormitories, with officers' rooms communicating in such way that one officer overlooks two dormitories. In addition there is a bath room, two "lock-ups"

The Mechanics' Institute Fair.

The preliminary announcement of the 21st exhibition of the Mechanics' Institute has been made. It will be held in this city, commencing August 24th, and closing September 25, 1886.

The management have determined to use their utmost endeavor to make this occasion a memorable one, and worthy of the manhood ushered in at this auspicious time. The advantages of this city, to the producer, manufacturer and State at large, for a comprehensive

Aluminium.

A private letter from Kern county informs us of the discovery of a deposit of very pure sulphur. Close to it a metal has been found which they suppose to be aluminium, and which will shortly be prospected. This discovery is on the oil belt. We are asked by the correspondent referred to, concerning the value of aluminium.

The useful properties of aluminium are becoming better known than formerly, and considerable interest is manifested in the prospect of

the manufacture of the metal. It can be used to make wire, pens, pencil cases, railway carriage fittings, locks, bolts, barnes furniture, chandeliers, cutlery, ships' fittings, instruments, etc.

Aluminium is coming into use in the manufacture of alloys, such as aluminium bronze. In this country it is being more extensively used in making the lighter parts of such instruments as galvanometers, and other physical instruments used in scientific experiments, for delicate weights, suture wire, and in engineering, astronomical, and optical instruments. It is sold as leaf, in books, like gold leaf for decorators, at from 40 to 50 cents per book, and is being experimented with by makers of jewelry. Its use is extending slowly, its cost being the principal obstacle.

The price of American aluminium ranged from 75 cents to \$1 per ounce troy in 1883, and \$1 per ounce in 1884, according to quality. It was formerly worth \$1.25. In 1884 the imports were 554 pounds avoirdupois, valued at \$7463.

Until recently the aluminium sold in the United States was all of foreign origin, but it is produced in this country, by a process patented by Wm. Frisbuth, of Philadelphia, who turned out 1000 ounces in 1883, and 1800 ounces in 1884. The aluminium cap or apex of the Washington monument was cast by this gentleman. It is of pyramidal form, is about 10 inches high, its base is six inches on a side, and it weighs 100 ounces.

The small mines and mills in Six-mile Canyon and Gold Canyon and also the main mills on Carson river are all in good working condition, having perfectly recovered from the rough setbacks experienced from the late storm and resultant floods.

GEORGE W. SMILEY, for a number of years caller at the San Francisco Stock Exchange, and well known to mining men on this coast, died in London last week.

NEW BUILDING OF THE BOYS' AND GIRLS' AID SOCIETY.

and a sick-room. The third story, or attic, is not divided at present, although it is to be finished like the rest of the building.

The lot is near the park entrance, and some six feet above grade, which will admit of a good terrace and room for flowers and vines. This will be kept in order by the boys, who will be taught by a good gardener employed for the purpose.

It will be seen that in providing a "workshop" the question of manual labor has been considered. There will be a competent shop supervisor, able to teach the boys simple mechanics. It is not the policy of the society to keep children long enough to learn a trade, but they can begin learning the principles of mechanics and use of their hands.

The girls of eleven and over will be taught by a skilled seamstress both hand and machine work.

The gift of Mr. Crocker is the principal one of three buildings (the others yet to be provided for). The society is doing a good work, and after a long struggle is coming into more prominence, so that it will doubtless receive further gifts.

general display at one time and place, of all the products that are making our name famous throughout the world, must be apparent to every thinking mind, and particularly that when the Grand Army of the Republic, and the largest influx of strangers yet known on this coast will be here, to partake of our hospitality, and to seek information about all that pertains to the Pacific Coast.

The finest products of the husbandman, the best work of the skilled mechanic, and the happiest effort of the artist should be prepared and presented on this occasion, and the management is specially desirous that the various portions of the State be represented by counties or individuals, and to that end will furnish every facility and convenience for the proper display and care of goods, and have decided to offer liberal premiums to exhibitors.

The Mechanics' Pavilion, that now has an area of floor space of over 158,000 square feet, will be still further enlarged and refitted for this exhibition. The premium list is being prepared, and, with the rules and regulations will be ready for distribution at an early day,

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Butte, Montana.

[By Our Traveling Correspondent, R. G. HUSTON.]

Butte City, Montana, the silver and copper metropolis of the Union, is located in Silver Bow county, near a creek bearing the county name, 104 miles southwest of Helena, and some 400 miles north of Ogden. Communication with the outside world is carried on via the Utah Northern railroad, which connects at the northern terminus, Garrison, 45 miles from Butte, with the Northern Pacific and at its southern terminus with the Union Pacific and Central Pacific railways.

The town is scattered over a southern slope of a spur of the main Rocky mountain range. The site was originally located for placer mining some 21 years ago, and was at that time chiefly noted for the poor quality of the gold dust extracted here, it only being worth \$8 or \$10 per ounce, all the other placer gold taken out in this territory being worth double that amount. The altitude is nearly 6000 feet above sea level, being close up to the main range, only a few miles from where the waters of the continent agree to disagree, and pursue opposite directions. Silver Bow valley spreads out into quite a beautiful little valley here, and bears off to the southward for some miles, and is then lost in the mountains in which the creek heads.

For years and until Feb. 1881, Butte was in Deer Lodge county, but at the above time by an act of the Territorial Legislature, the county of Silver Bow was cut off from the southern part of Deer Lodge and Butte as a matter of course was chosen as her county seat.

The new county started in with an assessed valuation of \$4,000,000 and in four years has very nearly doubled, the assessment of 1885 showing \$7,546,781. The population was then some nine or ten thousand, and now Butte claims 21,000. This, of course, includes the villages of Walkerville, Meaderville and the station and they are virtually one, as they are in a manner built up from one to the other.

The Growth of the Town

Has truly been phenomenal and can only be accounted for by the large amounts of money disbursed by the different mines for labor and supplies that required labor to procure. Many leads were discovered during the first years of the placer mining here, but they were of a character of ore of which but little was known, and were not much thought of.

A quartz mill was put up here in 1867 by Mr. Chas. Hendrie, but owing to the fact that the mill was for saving gold and the ore they produced to treat carried a preponderance of silver, the enterprise failed and for years the mill was shut down. It was afterwards purchased by Judge A. J. Davis and remodeled into a silver mill, and is yet treating silver ore successfully, and known as the old Lexington mill.

Late in 1875 John Howe, one of Montana's early pioneers, erected the Centennial mill, and early in 1876 commenced the first successful treatment of ores in Butte, and from this date the town began to grow. It still continues and from the present appearance of the different mines, the depth to which they have been tested, the immense size of a number of them, and the number of other properties being prospected that are showing up to be permanent paying properties, I would not be surprised to know that at the end of another year the population had increased to 30,000.

Previous to this time a number of parties had selected ore and shipped it East for treatment; but, of course, the high rates of freight must have consumed most of the product of these shipments. This Territory is now producing more than one-fifth of the world's product of copper. The worth in dollars of the copper produced from the Butte mines for 1885, was \$8,500,000, the silver \$6,750,000; the total placing Butte a long way in the lead for precious metals for the year just ended.

The Outlook

From my impression, is that the year 1886 will far exceed any previous one in volume of product, and consequently in general prosperity. Many new mines have been opened and are ready, or will be, by the opening of spring, to take out ore, and as there are custom mills and smelters both here, there will be no trouble in getting their ore worked and satisfactory results obtained.

Also many of the old regular producers have so increased their capacity that their product will be largely increased and the output of the camp correspondingly increased.

The freight receipts via the Utah Northern Railroad will probably give an outside party a better idea of the magnitude of the business of the town than anything else I can give them. For the year ending Jan. 1, 1886, the freight receipts were nearly 230,000 tons and the freight forwarded was 235,000 tons; this of course was nearly all bullion and copper matte.

The city incorporated in 1879, and is governed by the usual mayor and aldermen that look after the welfare of corporations of that kind,

and her various interests are carefully looked after and law and order maintained in the fullest sense of the word. The circulation of so much coin every month among the masses naturally attracts an army of adventurers, and amongst them rascals in a great plenty; but there are very few cases of robbery or violence to dispose of, and in fact, it is about as orderly, and life is safer here than in the Bay City, and when we consider that we have here a motley crowd of the rougher element gathered in from all the different mining camps from Mexico to Alaska, it is certainly wonderful that peace and quiet reign supreme.

Butte Is Well Supplied

With all the modern improvements of the age. First of all, it is supplied with electric light by an incorporated company, who have a magnificent plant and sufficient capacity to meet the demands of the rapidly-increasing population. By a contract with the City Council, they supply 11 masts in different parts of the city, so that the helated traveler need experience no inconvenience from dark streets. The tower on the courthouse is furnished with four arc lights of 2000 candle-power, and looms up like a star in the distance, particularly to a stranger coming into town through the valley at night, as I did. These lights are at an elevation of 150 feet above terra firma.

The courthouse is or should be the special pride of the residents of Butte, for it would certainly do credit to a much older city. It was erected at a cost of \$150,000, and is a good example of the enterprise and spirit of men in these mountain towns. Whilst at the time, I understand, the conservative portion of them did not fall in with the idea, it will, I think, ultimately prove just what they wanted, as it gives them ample room and no doubt will for all time to come. It is well and substantially built of brick, iron, white sandstone and granite, and in the matter of architectural beauty is certainly not lacking in any particular.

It is two stories in height, and surmounted by a large tower running up to the height of 150 feet. The upper story is lighted by gas, the lower by incandescent lights, and is strictly a "modern improvement" building.

The county jail is in the rear and connected by a passage way, and is also substantially built and equipped with Pauley's patent cells of chilled iron and steel, safety locks inclosed in iron boxes, has a capacity of 64 prisoners, and from the close proximity of the Territorial penitentiary that it is probably as much room as they will ever need to serve the ends of justice and correction.

The Butte gaslight and coke company is another of her live enterprises, with \$100,000 paid up capital. They have a fine plant, present capacity about 50,000 cubic feet per day, and are prepared to increase it whenever the needs demand.

The Silver Bow Water Company supply the place with good water from a mountain stream which is hrought some eight miles in a covered ditch, which is compulsory on account of the climate. This is reservoir on the hill above town, and affords them ample pressure in case of fire. So complete is this part of the arrangement, that the city authorities sold their steam fire engine to the Helena people because they had no use for it.

The wants of the weary traveler are ably looked after by Messrs. Baker and Foster of the Saint Nicholas hotel, and Dr. Beall of the Centennial hotel. I have heard that a movement is on foot to incorporate a company and build a fine hotel on the present site of the Centennial, and it looks like a paying scheme, for Helena with less than half the population supports three first class hotels, and I can see no reason why Butte should not do as well.

The town has been visited by fire three times since my arrival here, but they have a very efficient fire department and they soon get the best of it.

Mineral Lodes.

Continued from our last.

After mature reflection the court is unable to see any reason for changing the conclusions it then announced, and it will be governed by the principles enunciated in determining this case. This, of course, leaves the question to be decided mainly one of fact.

The mines in controversy are situated in a low group of mountains, one of that type of small mountain ranges so common in the Great Basin between the Wasatch and Sierra Nevada mountain ranges. The town of Eureka is located in a gulch or gully between two hills or ranges, which extend easterly and westerly. Running northerly from the southern range is a spur of the mountain, which declines quite rapidly to the town below. North of the town the northern range of hills rises quite precipitously. The Eureka and Montana mines are located along the spurs just mentioned, their course being northerly and southerly. From the southern end of the Eureka claim the outcrop or apex is clearly visible, until within 750 feet of the northern end line, where a point is reached where the rock has been eroded away and covered by debris and wash to the depth of from 100 to 125 feet. It is over this wash that the town is built, and it is underneath the wash that the greatest crushing and breaking of the lime rock has occurred and the complications been produced by nature, which have occasioned this litigation.

The Bullion claim, No. 76, adjoins the Eureka

on the west, and is located over the wash to the east of the vein. There is an extensive

Area of Intrusive Rock.

Called by the miners porphyry. Next adjoining that is a broad belt of magnesian limestone. Going with the magnesian limestone there is a narrow belt, somewhat irregular, of thin bedded limestone and shales, more or less calcareous and more or less silicious. Bounding this limestone on the west is a broad and extensive belt of quartzite. The mines in question are found in the limestone formations. These are rocks of sedimentary origin. Their original position was flat, or horizontal. Subsequent dynamic disturbances have altered their original position. They have been raised up—tilted up; have been cut apart, and the basic edges of the strata are in many places visible on the surface. The position of the lime beds at Eureka is now nearly vertical. In some places they dip slightly from the vertical line to the west, and in other places, especially in the southern portion of the mountain south of Eureka Hill, dipping to the east. At the time the lime beds were uplifted they were extensively faulted, on the line of what is called the main fault, or 24 fissure. This great fissure runs through the rock underneath the wash and has caused the beds to bend or buckle, turning them sharply to the west and causing more brecciation than in other portions of the mine.

The ground is more or less broken and fissured from end to end. There are a large number of cross-fissures, and there are several that run north and south with the bedding. Some of these fissures show lines of motion and quite high polish on their walls. Two in particular, which have during the case been called the east and west fissures

Show Clearly Defined Lines of Striation

In many places, and at some points exhibit beautifully polished walls. It is conceded by all the witnesses that the rocks were crushed, rent and fissured before the period of vein formation. It is admitted by all that the precious metals came up from below in solution, in the form of mineralized waters, through openings in the rock, and were deposited where we find them to day.

The Conflicting Claims.

The Eureka Company contends that the ore found in the claims is one broad lode which is wider than the side lines of the Eureka toward its northern end, and extends into the Bullion. On the other hand the Bullion Company claims that there are two veins or lodes. That the two longitudinal fissures, called the east and west fissures, to which the court has called attention, are the east and west veins. It claims that the precious metals were brought up from below through these fissures and no others, and that they are divided by a clearly defined boundary of mineralized country rock. It also claims that the west vein passes entirely without the side lines of the Eureka and becomes the Bullion lode. These are the conflicting claims of the parties upon the facts, and this is the issue the court must decide.

The Question

May perhaps be stated more intelligently as follows:

First—Is there one broad lode, or are there two veins?

Second—If there are two veins, does the west vein pass without the side lines of the Eureka?

Much may be advanced in favor of either theory. In fact, this is a case in which men may honestly differ. The court can only determine it by the preponderance of the evidence. Upon the one hand it is contended that the limestones at Eureka are more or less dolomitic, containing carbonate of lime and carbonate of magnesia. It is said that the carbonate of lime is more readily soluble in waters containing free carbonic acid than is the carbonate of magnesia, and that waters charged with free carbonic acid would erode, eat out and alter the dolomite. That irregular caverns or chambers would be formed, and that the mineralized waters coming from below through numerous fissures, would deposit their minerals

In Irregular Bodies.

With but little reference to the fissures. On the other hand, it is urged that while it is true the ore is not found within the walls of fissures, yet that it is deposited through the agency of fissures, and that all the ore bodies will be found to connect with either the east or the west fissure, and that the two lines of ore bodies are clearly separate and distinct.

What makes the question harder for the determination of the court than it would otherwise be, is the fact that there are no well defined boundaries to the ore bodies. This ore is deposited with that irregularity and uncertainty that we must expect in limestone deposits, where, as in this case, there is not found as yet either a foot wall or a hanging-wall.

The court is unable to accept the argument of counsel for the Bullion, that the east and west fissures are the east and west veins, and that where the west fissure crosses the west line of the Eureka, the vein crosses. The court is unable to adopt this theory, because there is no ore found in the fissure; but there is ore found each side of it and sometimes a long way from it. To whom do these ore bodies belong? The fissure itself is substantially barren. It may have brought mineralized solutions from the great source below, but it was merely the channel through which the waters flowed.

However, in the view which the court takes of this case, it is unnecessary to determine whether there are two veins or one broad lode. The ore bodies on the west side of the Eureka claim are said by the Bullion to have been deposited through this agency of the west fissure. The court does not think that

A Barren Crack in the Earth

Is a vein or lode, within the meaning of the law, and hence it cannot bold that where the fissure crosses the west line of the Eureka the vein crosses. This simplifies matters, and narrows the inquiry to the question as to whether the line of ore bodies upon which the Eureka discovery is located passes outside the side lines of the Eureka. The testimony shows that it does not.

The Ore Bodies of the Eureka

Are within its side lines up to a point westerly of and about opposite the Eureka main shaft. Here the wash begins to be encountered in depth, and here, owing to the buckling, breaking and turning of the lime beds, the ore bodies are turned towards the west and cover a much greater space in width than they do further south, but the Eureka lode has its apex underneath the wash, and does not depart from the claim. It is broader and its course seems to be more westerly. But large ore bodies are found in the north and south center drifts, in the court raise, in the Dower stope and at other points, and their connection with the ore bodies further west is plainly shown. The mineralization found throughout the northwest and southwest tracing drifts, through the north and south center drifts, in the McMyrtle raise, the Dower stope, the Henderson drift, and the ore bodies found west of the Eureka west line, came from the same source, are impressed by the same forms, and appear to have been created by the same processes.—The Eureka case, 4 Saw., 312. In other words, they are one and the same lode.

I have already called attention to the fact that so far as the Eureka lode outcrops at the surface or can be disclosed by ordinary surface explorations, as defined by the witnesses on the trial, the Eureka location follows the course or strike of the lode. The point where

The Ore Bodies

Curve westerly and the lode becomes wider than the side lines is upwards of one hundred feet beneath the wash. The question therefore arises whether, if a locator follows the course or strike of the lode in making his location, so far as it is indicated by the surface outcrop or surface exploration, the law will not presume his location to be laid along the lode for the entire distance to which he is entitled by the statute. The law does not require impossibilities. It does not require a man, when making his location, to make explorations a hundred feet or more beneath the surface. It simply requires him to act in good faith; and if, in good faith, he follows the lode so far as he can by surface indications and surface explorations, he should not be cheated out of his property because, a hundred feet beneath the wash, a great convulsion of nature has caused his vein to pass partly outside his side lines. With regard to

The Location of Mining Claims

The Supreme Court of the United States has said that the most practicable rule is to regard the course of the vein as that which is indicated by surface outcrop, or surface explorations and workings.—Flagstaff case, 98 U. S., 460. In this case the location followed those indications. The law says he is entitled to a certain number of feet of the lode. Is it fair to say that he shall not have them because, after having followed the outcrop and laid his claim upon the course of the lode, so far as he could gain any knowledge of the same, he finds that the heads of lime beneath the surface are so bent to the west that a portion of the ore bodies lie outside his lines?

I have suggested these matters as indicating that it is but simple justice that the Eureka

Should Have Its Lode

In its entire length. The Bullion did not know that there was any ore within its claim, No. 76, until about the time the suit was commenced. It was discovered then, by sinking a shaft, after making a survey of the Eureka's workings. The Bullion discovery is on claim No. 68. Claim No. 76 was segregated from 68, and was thought to be of but little value. I am pleased to feel that the facts do not require me to do any injustice in determining this case in favor of the Eureka. The law and the facts enable me to say that the Eureka shall have that to which it was entitled when its location was made. Had the locator of the Eureka seen fit to sink shafts through the wash south of the Eureka main shaft on a line above the north and south center drifts, he would have found as he reached the rock, that the ore apexed within his location from one end to the other. Under such circumstances the court cannot, in reason or in justice, say that the lode passes without the claim.

This disposes of all the questions that it seems necessary to discuss in this opinion. The other questions raised, as well as those I have just considered, are decided in the findings of fact and conclusions of law to be filed in the case.

Judgment must be entered for the plaintiff in the cross action, the Eureka Hill Mining Company, in accordance with the findings.

ORLANDO W. POWERS, Judge.

MECHANICAL PROGRESS.

Triple-Expansion Engines.

The first volume of the "Transactions" of the recently established North-East Coast Institution of Engineers and Shipbuilders, England, contains a paper on "Triple-Expansion Engines," by Mr. Taylor, which is well worth notice. Mr. Taylor was one of the first engineers to make triple-expansion engines a success at sea, and what he has to say on the subject, therefore, claims attention. Mr. Taylor attributes the superior economy of triple-expansion engines to the fact that larger measures of expansion may be used with it without entailing disastrous cylinder condensation than is possible with any other form of engine, and apparently to nothing else. He asserts, also, as do many other engineers, that this result is due to the smallness of the range of temperature in each cylinder. In other words, the triple-expansion engine enables the heat-trap theory to be applied in practice to a greater extent than is practicable with the ordinary compound engine. Referring to this point the London *Engineer* some months ago undertook to prove that the economy of the triple-expansion engine is due to an entirely different cause.

If steam could be used in a cylinder of slate or other material which did not take up or give out heat, remarked our contemporary at the time, it would, according to the accepted basis of thermo-dynamics, behave very nearly like a permanent gas. If it was so far superheated that none of it would be condensed in the performance of work, it would behave precisely like a permanent gas, and the consumption of coal, as compared with the very best engines now running would be reduced by about 25 per cent. This result would be due entirely to this circumstance that there would be no condensation and no re-evaporation in the cylinder. We say "cylinder" advisedly, because no advantage of any kind is the way of economy of fuel could then be derived from the compound principle. The turning movements would be more irregular and the strains more severe, and the valve gear more complex, but with these things we have nothing to do at this moment.

After a technical discussion of the subject, the *Engineer* says: "The practical aspect of the case is that there is some special condition or factor operating to cause cylinder condensation, which is not fully explained by theory. In spite of the advantage apparently gained from the use of more than one cylinder, the fact is that condensation seems to be augmented rather than diminished. There is no obvious reason why as much as 43 per cent of all the steam that enters the high-pressure cylinder of a compound engine should be condensed; but if indicator diagrams tell any truth, the condensation does reach, and even exceeds that point. In Mr. Perkins' triple-expansion engine the condensation reached as much as 47 per cent, although the cylinder was jacketed. In the discussion Mr. Heck called attention to Mr. Seaton's paper read before the Institute of Naval Architects. Mr. Seaton stated that the results which he had obtained from a three-cylinder engine, with steam at from 100 to 110 pounds pressure only, were almost as good as those which he obtained with 160 pounds. Accordingly he had reduced his pressures, and he found that he did just as well with 140 pounds as he did with 180 pounds. This is very important testimony, as Mr. Seaton probably knows as much about triple-expansion engines as any other engineer.

The fact is that the heat-trap action of multi-cylinders has little or nothing to do with the economy of the compound or triple engine. It will suffice to say here that cylinder condensation is not an evil, provided all the condensed steam is re-evaporated under conditions which will permit it to be usefully employed. It is no more an evil than a fly-wheel is an evil; and the triple-expansion engine supplies more facilities for using initially condensed steam to advantage than the simple engine does."

Another number of *Engineering* contains a cut and an elaborate description of a triple-expansion engine of the steamship *Enfield*, the cylinders of which are respectively 21, 35 and 57 inches in diameter with 39 inch stroke and an initial steam pressure of 160 pounds. This engine is said to be performing remarkably well.

Compound Locomotive Engines.

According to the *Locomotive*, there is at present quite a lively discussion among the English technical journals in regard to the economy of compound locomotives. Mr. Webb, the master mechanic of one of the principal English roads, who has been running them for some time, says they have not proved as successful as it was hoped they would, hence some of the writers jump at the conclusion that the principle is wrong and that compounding must be regarded as a failure. An American cotemporary—the *Manufacturer and Builder*—does not think this conclusion is justified by the circumstances of the case, and holds, as a rule, that when a new departure is made in any department of engineering the forms of construction first tried should be modified to overcome difficulties arising in practice such as could not be foreseen. Our cotemporary has made the prediction that compounding will ultimately prove as successful in locomotive practice as it has in marine and stationary practice.

STEEL AND STEEL CASTINGS.—The raw material for the manufacture of wrought-iron and steel, and also for making castings of all kinds, is obtained by the reduction of iron ores in the blast furnace, and is handled under the name of pig-iron, which varies greatly in chemical composition, according to the purpose for which it is intended. Wrought-iron is the refined iron from the pig iron that does not occur in a fluid condition. Steel is the refined metal obtained in a liquid condition, and can be cast in molds, and has one advantage over wrought-iron, by containing a very small amount of oxide of iron and slag. The microscope shows these two deteriorating impurities in large proportions, forming a mechanical mixture with the refined iron. Malleable iron is the same inevitable pig of the required chemical composition, which is first cast in molds, and the castings heated in an oxidizing material that eliminates the excess of carbon that is always found in pig-iron and renders it malleable. It is a matter of controversy whether or not steel was known to the ancients; in our own period it dates back only a hundred years, and Sheffield, England, the home of tool-steel, enjoys the distinction of location. The manufacture of good crucible steel, although largely dependent on manipulation, is due to the material used in it; in other words, good crucible steel cannot be made from inferior material. For the best tool steel the best material is required, and so far none has been found to approach the celebrated brands of Swedish ores for this purpose. By far the greater part of the cost entering any tool is what is paid for labor, and in view of the many mishaps liable to occur, even under the most favorable conditions, the best steel should be used, as it is the most economical in the end, notwithstanding a comparatively slight advance in its cost.

EASTERN COMPETITION IN WROUGHT IRON.—The *Builder and Architect*, of this city, says that the fact that the "box girders" made East and shipped to San Francisco for use in the Union Club building, are strongly suggestive, alike to "wrought-iron workers," owners of property, tradesmen, general dealers and business men. To wrought-iron workers, as suggesting the necessity for more complete and perfect arrangements, machinery and appliances, enabling the handling, shaping and dressing of heavy girders and all other descriptions of works, to advantage, and doing all that can be done in any other part of the United States, as cheaply and as well, barring differences in cost of labor, and even overcoming that to a large extent, if not entirely. A material difficulty in this connection exists in the fact that the number of shops and firms operating in this line are far too numerous for this city, except in extremely brisk times; that while there are two or three fairly equipped establishments, sufficient in appointments to supply all ordinary demands, or, in fact, anything that might be required of them in wrought-iron work, there is no one firm or establishment of comparative "gigantic proportions" capable of taking hold of any work offered and defying all outside competition. The freightage and handling expenses of plate iron in long lengths certainly should not be any greater, if so great, as that of heavy manufactured girders. In this regard, the advantages should be on the side of our local workers, with which, as a fact, leaves all the advantages possessed abroad, in the more complete methods of working, and any difference that may be in labor and incidentals.

METAL IN HOUSE BUILDING.—In the East or in any locality where thunderstorms are frequent, it is suggested by a Philadelphia paper that the metal in the fittings should be reduced to the smallest practical amount. In this connection the following hints are given: Stove pipes, the foils at back of mirrors, gas and water pipes are good conductors of electricity, and one should avoid their neighborhood in a storm. Brick furnaces are better every way than iron ones, and there is so much gain of safety in dispensing with these masses of metal in the house. Gas is a barbarous thing for dwellings anyhow, killing plants and poisoning people, so its pipes may be got rid of. As for water pipes, rubber hose in proper casing will be found to answer well and have the additional advantage of saving plumbers' bills, as it will not freeze in winter. It is argued from a scientific view that the employment of much metal in house building is injurious to the health of inmates, as it interferes with the magnetic current, and that delicate persons condemned to live in buildings with metal roofs, iron stairs, girders, or with a battery of gas and water pipes, steam coils and electric wires about them, infallibly suffer in strength and nerves. Be that as it may, and the view is quoted only as a curiosity, it is certain that low houses, broad rooms, and the least metal about them are safe houses in thunder storms, and all the clatter about modern conveniences, or the ridicule of friends in rugged health, who never knew the quiver of a nerve, will not weigh a feather against the gain in peace of mind in these constantly recurring cries of weather.

THE BEST MACHINERY AND TOOLS.—The *Mechanical World*, of London, says that the United States has the best machinery and tools in the world, and M. Lourdolot, who was recently sent over here by the French Ministry of Commerce, says that the superiority of tools used here, and the attention to details too often neglected in Europe, are elements of danger to European industries.

SCIENTIFIC PROGRESS.

Tracing a Typhoon Around the World.

At the meeting of the Meteorological Society of London, in November last, Mr. Henry Harries read a very interesting paper on the origin and progress of typhoons, in which he made particular mention of a noted phenomenon of this character which traveled, in a zig-zag manner, almost around the world. Its appearance at different points was carefully and, no doubt, correctly traced by numerous observations along its track at meteorological stations on the land, and by the examination of ships' logs which chanced to be in its path across the Indian, Pacific and Atlantic oceans. Probably no typhoon or gale was ever traced over so lengthy a track. We copy from the London *Athenaeum* as follows: The earliest evidence of the formation of the typhoon was on September 27, 1882, some distance east-southeast of Maui, some ten degrees south of Japan. At first the movement was toward northwest, five miles an hour; but on September 30th, when the storm area extended to 1300 miles northwest of the center, it turned toward northeast, crossed the southeastern corner of Japan at 33 miles an hour, and attained a maximum rate of 51 miles per hour on October 2d to 3d, after leaving the Japanese coast. In the neighborhood of the Aleutian Archipelago the progress was very slow until the 9th, when it rapidly increased to 35 miles an hour, and entered Oregon on the 10th. The Rocky mountains proved to be no obstacle to the progress of the typhoon, which crossed the range at 36½ miles an hour, and maintaining this rate passed across the Northern States into Canada. Thence it crossed Hudson bay and Labrador into Davis strait. Altering its course to south of east it passed the southern point of Greenland on October 16th; and two days later, in lat. 55 N., long. 27 W., it was joined by another disturbance, which seems to have formed about October 9th in 20° N., 48 W. The juncture of the two storms was followed by a complete cessation of progressive movement for a week (October 19th to 26th); and during this period there was formed the subsidiary gale which suddenly arrived over our southern counties on the morning of October 24th, completely upsetting the meteorological office forecasts of the previous night. The author quoted several records from ships, which went to show that this secondary storm had not formed until nearly midnight, and that reports from our low-lying stations would not have enabled successful forecasts to be issued before 3 A. M., October 24th. As this gale passed away, the primary moved into the bay of Biscay and entered France on the 27th. As in Japan and America its advance was marked by violent gales and destructive floods over a very extensive area, from Algeria northwards. The damage caused by the floods in England was serious, but trifling compared with the losses in Southern and Central Europe, where the destruction was enormous. This typhoon was the principal contributor in making the month of October, 1882, the worst within living memory. With this final effort it seemed to have expended its fury, and in crossing France and the Netherlands it gradually filled up. The last trace of the typhoon was in the Baltic on November 1st, when it quietly dispersed after covering over 14,000 nautical miles in 36 days—nearly three-quarters of the entire circumference of the earth—and the longest track hitherto followed day by day. This is the first storm which has been followed day by day from the Pacific to Europe.

Meteors and Meteoric Streams.

Much attention has been paid of late years to the study of meteors, and especially to their periodical occurrence in large numbers, or in "streams" or orbits, as has recently been ascertained to be the fact in regard to these periodical appearances. These streams move in orbits more or less eccentric around the sun, and are supposed to represent what were once cometary bodies, now broken up into small particles of matter, streaming along and occupying vast longitudinal areas of space. The asteroids form a stream of a similar character, only less elliptical, not crossing the path of any planet, as the meteors proper do. The asteroids, however, are undoubtedly the fragments of a reared planet, and are much larger in bulk. Probably all meteors are fragments of reared comets or planets, or particles of matter thrown off from planets like their moons, in the early stage of their planetary existence.

Prof. Kirkwood, of Bloomington, Indiana, has recently pointed out, in a paper read before the American Philosophical Society, that a careful discussion of the meteors which have been observed in the middle of November shows that there are three meteoric streams moving in the orbit of the comet of 1866. Of these the principal group is the well-known one which produced the great showers of 1833 and 1866; the period of this was shown by Prof. Adams to be about 33-25 years. Prof. Kirkwood identified the second group in 1875 from an examination of the meteoric observations of Humboldt and of Quetelet; its period is about 33-31 years, and a shower from it will be due about November 14, 1887; but the display may commence about that time next year. The third group has been less observed than either of the others; its period is about 33-19 years, and another shower from it will not be due until 1912 or later. A comet (or rather a pair of comets) was

observed in China in the year 1366, and this is generally supposed to have been an appearance of the comet of 1866 (500 years being very nearly equal to fifteen multiples of 33-25). Prof. Kirkwood suggests that the comet may have undergone a great diminution of brightness in 1366, in consequence of the separation from it that year of the first and largest of these groups.

A Revival of the Bronze Age.

We had in the earlier ages of mankind a rough and polished stone age, a bronze age and an iron age, each distinguished by the character of the material that was predominantly used by men for their weapons and tools, and have now added to these ages one of steel. In a similar manner, we are now entering upon a revival of the bronze age, in which that substance in its varieties is to be put through stages of improvement like those that iron and steel have undergone. Many varieties of bronzes have been produced within the last few years that possess features strongly distinguishing them from the ancient alloys, and some very remarkable qualities as compared with them, in view of which they are frequently used in place of even iron and steel. The bronzes of the ancients were composed of copper and tin, as is also what is now regarded as bronze pure and simple, mixed in proportions varying according to the purpose for which the compound is intended. Other substances, however, are often added, without unclassifying the product, which is still called bronze, provided copper and tin are the chief constituents. Among these substances are zinc, lead, phosphorus, manganese, silicon, iron, nickel, arsenic, antimony and sulphur. It is the addition of certain proportions of one or the other of such substances that constitutes the modern development of bronzes manufacture, and which has given us some of the most useful and at the same time some of the most remarkable alloys known.

These comprise no fewer than eleven distinct products, all of which find their uses in connection with the practice of engineering. They are phosphor bronze, silicon bronze, manganese bronze, delta metal, phosphor copper, phosphor manganese bronze, phosphor lead bronze, phosphor tin, aluminium bronze, silveroid and cobalt bronze. There are also other bronzes which are used as substitutes for gold in cheap imitation jewelry, but they do not come within the scope of this article.—*Manufacturer and Builder*.

THE ORIGIN OF THE AMERICAN DOG.—Dr. A. S. Packard has contributed to the September number of the *American Naturalist*, a paper of universal interest on this origin of American dogs. He concludes that, though the impression that the domestic dog of the Old World has descended from a wild species distinct from the wolf may be well founded, in America, the evidence tends to prove that the Eskimo and other domestic varieties of dogs were domesticated by the aborigines and used by them, long anterior to the discovery of the continent by Europeans,—the varieties in question originating from the gray wolf or the prairie wolf. The subject is fully illustrated by quotations from the accounts of the early explorers. This opinion is supported by the well established fact that the domestic dog, and gray as well as the prairie wolf will hybridize.

USED IN SHOOTING OIL WELLS.—More than one hundred tons of nitro-glycerine were exploded in wells in the Pennsylvania oil fields during October says a Warren correspondent of the *New York Sun*. November, the closing month of the year for active field work has already seen this wonderful record, and will go it at least ten tons better. In the flush days, when the patent was exclusively controlled by the Roberts monopoly, the deadly explosive was measured by the quart, and commanded most exorbitant prices. It then cost a poor man nearly a month's production to have his well shot. Now the smallest producer in the region can afford to dump a barrel or so of the stuff into his well. There are perhaps twenty firms in the country that are piling up fortunes making glycerine.

THE VALUE OF SCIENCE is not in the discipline which it gives the mind, nor in the pleasure which its acquisition conveys, but in the use which can be made thereof. Sooner or later, each scientific fact, quarried from the great ledges, at which men have toiled unceasingly for centuries, becomes of use with special fitness. It may make us better, or wiser, or richer, or stronger or happier or more than one of these; but its great use is sure to come in time, if not at once.—*Grimshaw*.

ARTIFICIAL FORMATION OF IRON ORE.—A curious phenomena is said to have been recently observed, and supposed to have been caused by electricity. In removing a lightning rod which had been imbedded in a clayey earth containing iron in the form of oxides, for about fifteen years, there was found attached to it a lump of iron ore, weighing ninety-six pounds, supposed to have been aggregated by the action of electricity from the surrounding earth.

A NEW ELEMENT has been discovered in nickel ore from Norway. It is malleable, of white color, with a tinge of brown, presenting, when pure, a metallic luster, but oxidizing when exposed to the air. It is as hard as copper.

Passing Events.

There has been no lack of exciting topics of discussion during the past week, the anti-Chinese outbreak at Seattle, W. T., and the riots in Loudon forming the principal ones. The trouble in the coke regions of Pennsylvania is not over, and the Chinese agitation on this coast seems to be spreading in all directions. The nation is called upon to mourn the loss of another of the great generals of the war of the rebellion, Major-General W. S. Hancock having died suddenly on Monday last.

Considerable attention is just now being turned to Northern California, which is found to be adapted to the cultivation of citrus fruits, and doubtless it will be more in favor for settlers hereafter. This will benefit the mining industry as well as the agricultural in that region, and those who visit the northern counties will find much that is attractive in the mineral fields.

After a long reign of assessments the Comstock comes to the front once more with a mining dividend. The Consolidated California and Virginia has declared one. It may be, with the more economical methods in vogue, some of the large mines there will yet pay handsomely. The miners are digging away in hopes of discovering a bonanza, which any day they may meet, for the possibilities of the lode at great depths are now being tested.

A BILL has passed the Senate appropriating \$350,000 to purchase a site for a post-office in this city.

Mine Signals.

The census officials made an inquiry into the modes of signaling in mines on this coast, and it was found that only 72 of the important ones use vocal signals alone, but in a large number of workings signals by voice are generally the only means of communication. The telephone or the telegraph would seem to be the most desirable means of signaling in large mines were it practicable to preserve the insulation of the wires. In most cases where it has been tried, however, difficulties have been experienced from imperfection of insulation. The wires must pass down the shaft and are subject to mechanical abrasion. Most shafts, too, are wet, and the water contains more or less acid. The batteries also introduce a complication which is undesirable. Experiments are being made, however, on telegraphic methods, which, when in good order, permit signals to be sent to the surface from the cage, even when it is moving at a maximum velocity.

The commonest mode of signaling in mines of considerable size is by means of the bell rope, and the method has the advantage of extreme simplicity. In deep shafts, however, it requires much force to ring the bell, and when the cage is in rapid motion it is extremely difficult to communicate with the surface. A very large proportion of accidents are induced or aggravated by the difficulties of signaling, and the imperfection of signaling apparatus. Many mines using gong or bell as a principal means or signaling have also other means. Among them are the telephone, telegraph, speaking-tube, Cornish clappers, triangle, shaking rope, rapping on bucket, etc.

COMBINATION MINE AND RANCH.—Work has been suspended upon the Caribou mine, at Fleming, New Mexico. With the exception of a few pockets of ore, nothing of consequence was struck, while the constant and excessive inflow of water greatly retarded operations and proportionately increased the cost of operating. The Silver City Enterprise says that the owners of the property have concluded to utilize the large volume of water their mine is capable of producing and for that purpose have resolved themselves into a cattle company. There being no other water of consequence for miles around they will produce an artificial stream in the gulch below the mine by pumping the water into it. As there is a large scope of excellent grazing country that can be made useful for cattle raising the project seems a very feasible and good one. The cattle ranch is now worth more to them than the original and subsequent cost of purchase and development of the Caribou mine. It isn't every country where people can prospect for a mine and strike a cattle ranch.

THE COMSTOCK.—The consolidated Virginia and California shipped \$64,136 in bullion last week. During the week 591 tons of ore were shipped to the Morgan mill, and 1,653 tons to the Eureka mill. The average value of this ore per battery sample assays was: Morgan mill \$15.22 per ton; Eureka mill, \$13.01 per ton. A dividend has been declared. Not a bad showing for what has been called a "played out" mine. The Best and Belcher had \$3,068 on hand on the first of the month, Crown Point \$26,497, Gould and Curry \$20,615, Hale and Norcross \$20,123, and Chollar \$7,974. In any other camp but the Comstock this would be considered a good showing. The letter of one correspondent in this number of the PRESS gives some interesting facts concerning deep mining on the lode.

THE Virginia Chronicle says the pay-rolls of the mines and mills engaged in crushing Comstock ore, and outside mines in Storey county will swell the total amount disbursed to employees for the month of January, 1886, to \$180,000, a falling off of \$10,000 from the sum disbursed in December. This is due to the shutting down of the mines and mills during the late storm. The pay-rolls for February will exceed \$200,000.

At the regular semi monthly meeting of the mine engineers, a resolution was unanimously adopted, indorsing the application made to the Board of Supervisors by the stationary engineers for the appointment of an official boiler inspector.

Practical Treatise on Hydraulic Mining.*

"A Practical Treatise on Hydraulic Mining in California," with descriptions of the use and construction of ditches, flumes, wrought iron pipes and dams, flow of water on heavy grades and its applicability, under pipe-pressure, to mining, has been written by Aug. J. Bowie, Jr., the well known mining and consulting engineer of this city, and published by Van Nostrand. The work is really a text-book, and probably the best one contributed to the literature of mining for some years. Mr. Bowie has had large experience in the subjects of which he treats, and has had access to sources of information which have not been open to other engineers; and he has, moreover, carried on, at his own expense, extensive surveys during a number of years for the purpose of obtaining exact information. He has made a special study of ditches, dams, etc., and his descriptions, tables, and conclusions will save a great deal of money and time in the future to any one engaged in this class of work.

The book is handsomely illustrated. A large map accompanies it, this being a map of the lower portions of the Sacramento and San Joaquin rivers, showing the principal auriferous deposits in California, and the tributary streams draining the mining districts. It is on a scale of 18 miles to the inch, and is handeomely and accurately made.

The preliminary chapter is devoted to the records of gold-washing all over the world, and is replete with most interesting information. The second chapter is on the history and development of placer mining from its incipency in California. The third is on the general topography and geology of California. These subjects are treated in concise style, and the general features of the geology and geography of the country are sketched, so as to enable the reader to picture to himself the regions which are described in other chapters, and to thoroughly understand the working of the hydraulic mines. There is also a chapter on the distribution of gold in deposits, and the value of different strata, and on the amount of workable gravel remaining on the western flank of the Sierras. Mr. Bowie then describes the different methods of mining gold placers, both surface and deep. The chapter on reservoirs and dams is a specially useful one, describing their construction, and the principal ones in the State. His remarks on the measurement of flowing water are excellent and of great value.

As a matter of fact this is the first time that it has been practically demonstrated what the coefficients of discharge are for water flowing in ditches on heavy grades. The text books heretofore have never treated this subject, and the engineer has been left to grope in the dark and apply the old formulas, which has caused endless loss, and in some cases entailed financial disaster. The deductions given in this chapter are drawn from the facts as therein shown, viz: The area of the ditches is stated, the grade or slope given, the quantity of water turned in at the head of the ditch is accurately measured and stated, and the amount discharged at its outlet at varying distances given. The results are then formulated. It is a noteworthy fact that all experiments for the determination of coefficients for the flow of water in ditches and canals, have been made on short lines and on light grades, and even Higham, in his work on hydraulics, gives 10½ feet per mile as the heaviest grade on which water would probably be made to run in ditches or canals. The instances cited by Mr. Bowie show grades from 12 to 25 and 30 feet per mile, and the distances over which the water is run and delivered are 40 and 50 miles and over.

The chapter on ditches and flumes gives the location and construction principles, examples of ditches, flume construction, dimensions, cost, etc. In the treatment of this subject drawings are given which show in detail the construction of the various forms in use and which have been proven by long experience to be the best. The cost per foot or per box is given in every instance, and the rate of labor and material is stated, so that any person is enabled to make estimates by substituting other rates, as the case may require. In the chapter on pipes and nozzles is a very useful table giving the amount of iron, weight, etc., in differ-

ent sized pipes, with varying thickness of gauge used in their construction. This is accompanied by a table of rivets. In the chapter on blasting, details are given which have never before been published. Descriptions of notably large blasts are given, with systems adopted, cost, etc. This chapter is a very useful one, as the methods are carefully described, with diagrams, etc. That on the distribution of gold in sluices is an interesting one, giving tables which show proportion of gold caught at certain distances in the sluices, under currents, etc.

Mr. Bowie's remarks on the "Duty of the Miners' Inch" are practical and to the point. This subject has been usually handled in general terms. Absolute data are here given, and the facts from which they were deduced are stated. This is specially useful as showing what has been done with water on different properties, serving as a guide to those who wish to know what can be done with various quantities of water under the conditions stated.

The other chapters are on "mechanical appliances," "blasting gravel banks," "tunnels and sluices," "tailings and dump," "washing or hydraulicking," "loss of gold and quicksilver," and "statistics of the working and the yield of gravel." There are 72 engravings in the work, and a number of useful tables for reference derived from the experience of our largest companies.

It will be seen from this brief summary of the contents of the book, that it is not only to hydraulic miners that it is useful, but to placer, drift, river, beach, and other surface miners. The data concerning ditches, flumes, reservoirs, dams, etc., will be found of service even to those engaged in irrigating work or other users of water. Mr. Bowie has brought to his task experience and ability, and has produced a book of value not only to the profession of mining engineering, but to miners as well. He has confined himself to the technical discussion of his subject, without going into the vexed "debris question" at all. He gives his authority when quotation is made, and chance statements are entirely avoided. The work will be found useful to all miners, and will serve as a *valde mecum* for engineers in the branch of which it treats. All the subjects in the book are treated from a practical standpoint, and the results of actual experience are given: it is not a question of what may be done, but a question of what has and what is being done.

THE Kuebig Brothers of Calico, San Bernardino county, have failed in their mining and milling enterprise. Their liabilities are about \$6,500 including about \$2,000 in attachments on the mill and other property and about \$1,000 mechanics' and laborers' liens on the same, by local creditors. Their failure is due partly to extravagance and useless expenditure, and partly on account of trying to mill from 8 to 12-ounce ore, and employing 40 to 50 men, three-fourths of whom were doing "dead work." The Calico Mining and Reduction Company and the Kuebig Bros. have spent \$45,000 in cash besides the bullion returns, amounting to about \$75,000, since they started the mill last Fourth of July. The Calico Print says that this is the only failure of any consequence that has occurred in the district.

THE Pacific Bridge Company will soon commence the erection of an iron bridge, consisting of three 100-foot spans, across the Los Angeles river, at Aliso street. The bridge is to be built for the Central Railroad Company, the street-car line.

IT is stated that the English purchasers of the Cottonwood Canyon nickel mines, Nev., intend to work the mines extensively and reduce the ore on the ground, as nut pine wood for fuel is abundant in the vicinity of the mines.

A COMPANY of capitalists have bought 320 acres of land, rich in iron ore, at Tintic, U. T., on the shore of Utah lake, and will erect smelting furnaces and go into the business of producing pig iron.

TAYLOR, Nevada, though much talked of outside, is said to be very dull at present. The White Pine News advises men not to come there in search of work.

J. B. RUPLEY, a miner well known through the southern mining country, died last week at Calico.

Deep Mining.—Is There Money In It?—Some Novel Theories.

[By our Special Correspondent.]

At present there appears to be a vigorous sentiment on the subject of deep mining in this camp. Whilst during the past few years no great bonanza ores, like those mentioned in our last article, have been struck, still the unflagging energies and the unswerving faith of those who have continued to operate these vast and expensive works, have always argued the utmost confidence in the ultimate discovery of such. If no paying ores are likely to be found in such deep and expensive mining, it would certainly display the height of prodigality, as well as sheer waste of time, to operators and stockholders alike, to continue in so fruitless a project. One theory, recently offered to the public, if conclusive, should certainly end all controversy as well as all further efforts in the department of deep mining. This theory is doubtless well worth our consideration, inasmuch as it emanates from such a source as a writer in a Government report. For instance, Mr. O. J. Hollister, in the report of the director of the U. S. mint for 1882 says, on page 262, in regard to the famous Emma mine, Utah: "It seems that in all these mines for a thousand feet down, on the dip of the formation are carried the ore chimneys, chutes, and channels, and below that they give out or cease to pay, thus giving color to the theory, that the presence of the precious metals is due to surface agencies."

"The same thing is observable at Leadville, in Colorado, and elsewhere. The Iron Silver, at Leadville, pitches into the hill at an angle of 20 degrees below the horizon, and the hill rises at considerably steeper angle. They claim 300 feet on the dip, and beyond that distance, on the top of the hill, are sinking for the same vein. It is doubtful whether the ore will continue that far, or indeed so far as 2000 feet. The overlying country rock is so deep as to have prevented the operation of surface agencies." "The Emma, Flagstaff and all the mines in the Little Cottonwood belt go down more or less like wells, the same as the channels in the Iron Silver, Silver Chord, and mines on Carbonate and Fryar hills, at Leadville, and in both places everything seems to indicate that the ore is lost for all practical purposes at a greater or less distance from the surface, governed largely by the thickness of the hanging country rock, and seldom exceeding 1500 or 2000 feet." Thus we have presented, by the writer referred to in this governmental report, a theory which, if acted upon, would effectually close and debar all further mining operations below the 2000-foot level. It assumes to state that all

Deposits of the Precious Metals

Are derivable from surface agencies (whether atmospheric, aqueous, chemical or electrical, we are not informed), and inasmuch as it is impossible for these agencies to operate below the 1500 or 2000 foot level, there can, therefore, be no deposits of gold or silver below these levels in sufficient quantities for any practical purposes.

The same Report, in setting forth the mineral interests of Nevada, follows out the above theory in regard to deep mining on the Comstock lode, and after recounting the bonanza outputs of the Ophir, Gould & Curry, Savage, Hale & Norcross, Imperial, Yellow Jacket, Kentucky, Crown Point and Belcher, and finally the Con. Virginia and California, says:

Stimulated by the unprecedented amount of ore found along the line of the lode, the various companies have prosecuted their work in sinking deeper shafts and driving drifts and crosscuts into unknown ground, at an expense totally disproportionate to the results attained.

So far as exploration has developed, no ore bodies of importance have been found to exist below the 2000-foot level, and it would seem as though this point was the deepest boundary to the zone of ore bodies, and yet the explorations have continued to a depth of, in some instances, 3100 feet.

It is a serious question whether it is advisable to continue operations in these mines. The ledge matter at this depth is of great width, but it contains only small seams and stringers of ore, in most cases of very low grade. Whether by following these they may lead to important ore bodies is of course unknown, but the search will doubtless be continued so long as the stockholders will furnish means to prolong the work.

By the foregoing statement and conclusion, the nature and importance of this question looms up most conspicuously into view. It is very plain indeed that the various companies on this Comstock lode are seriously bent upon the project of going down still farther into these mines until the small seams and stringers of ore develop into something more tangible and profitable. The machinery heretofore in full working order upon these various mines

is still upon the ground here, in a good state of preservation, although not all in full and profitable employment.

In Surveying These Various Plants,

Few would put the cost of this enormous and splendid array of works at less than \$30,000,000, and this whole mechanical plant is but the smallest portion of the value of the work that has been laid out beneath the surface on these mines to open up and extract the ore, as well as to prospect the surrounding districts adjacent. Admitting, as we reasonably can, that the entire property upon the ground, and the vast work performed beneath it, would scarcely fall short, but rather exceed one hundred millions of dollars, what must be thought of the wisdom of any one who would seriously question the advisableness of continuing operations in these mines, especially when we reflect that from the lowest estimates not less than four hundred millions have been taken from them as the result of previous efforts. Verily the theory that only began with a color in regard to depositing the precious metals through surface agencies has here put forth a wonderful and startling outcome, when the formulator of it would seriously question whether it is advisable to continue operation in these mines, since no ore bodies of importance have been found to exist below the 2000 foot level, and it would seem as though this point (2000 feet) was the deepest boundary to the zone of ore bodies; but still remarking that in violation of this principle,

Explorations Had Been Continued

In some instances to a depth of 3100 feet, and would doubtless be continued, so long as the

no means a novelty. Silver mining in Germany, at Freiberg, of a very deep order, has been successfully and profitably carried on since the 10th century. It is stated that a silver mine, over 6000 feet in depth, is now being worked in Silesia. Pliny and Vitruvius bear testimony to silver mining in their times, that went down over a mile and a half in depth, showing a skill in ancient engineering in the mining department equal to that which constructed the pyramids. If the ancients in the old world could sound the earth to a depth of nearly 8000 feet and make silver mining profitable, we should certainly conclude that no insurmountable obstacle should present itself to defeat the Comstockers from going down at least 4000 feet, as a fair test of their energy, skill and faith. Certainly the mineral interests of this camp at present and heretofore would seem to warrant an outlay of effort and expenditure, in its prospecting and development, of which the present would appear only infantile in comparison before any serious notion should be entertained as to the advisability of prosecuting the work or of turning over all these magnificent accumulations of property to the moles and to the hats. In the census report on the statistics and technology of the precious metals, S. F. Emmons in the chapter on lead smelting at Leadville, Colorado, makes use of this language concerning the Leadville systems: "In conclusion it may be said the lead smelting as carried on in this region, while not entirely beyond criticism, has been brought to a high degree of perfection, and is extremely creditable to American metallurgists."

When the writer of this (in 1880) was engaged in reviewing, with the superintendent, the extensive smelting works at Pueblo, Col.,

SET OF MINE TIMBERS.

stockholders would furnish means to prolong the work.

The conclusion drawn from such statement would be that it was but a waste of time, money and labor to prosecute an enterprise of so unpromising a nature. Inserted in a common newspaper, such declarations would hardly claim momentary recognition; but being published in the report of a Government official, and scattered throughout every gold and silver camp in the States, we believe such statements should be met with the closest scrutiny, and allowed such a place only as their proper merits justly entitle them. All mining interests of this character have long since been ranked among the systematic and ordinary industries of the country, and held subject to the same fluctuations as other pursuits: have their periodic seasons in the sinking fund, as well as their more acceptable and gratifying records in the dividend. The minimum rate of interest on the lowest estimate of coin already taken from these mines, would be amply sufficient to operate the whole of them, *in perpetuo*, and after a manner to correspond with the magnitude of the claim, which they hold upon a vast multitude, who have been so greatly enriched by them. Whilst

These Shafts on the Comstock

Are confessedly deeper, and the prospectings more extensive than any to be found on this continent, still, they by no means, as yet, come up to a standard corresponding with "the unprecedented amount of ore found along the line of the lode." Such being the case, we are naturally led to inquire, if the structural character of North America, in its mineralogical order, is so different from that of Europe as to admit of no terms of comparison. Deep mining in the old world, in quest of the precious metals, is by

put up mainly in the interest of Leadville ores, he felt irresistibly drawn to the same conclusion. If such an opinion could be cherished in regard to the Leadville works, equally as strong a one might be entertained in viewing the plant now operated in behalf of the Hale & Norcross, Chollar and Potosi and Savage mines. These mammoth pieces of machinery, employed on the surface as well as below ground on these mines are certainly the most marvelous of their kind that can be found in any part of the earth. Their manufacture and successful operation here may also be considered extremely flattering and creditable to American machinists and engineers.

J. B. P.

THERE are very few people at Quijotoa, Arizona. The well is closed. It is now said that the mines never belonged to the bonanza firms—they merely advanced money to work them on security on the stock.

THE supply of water in Six-Mile canyon creek is more than ample to keep the quartz mills running to their full capacity, and averages 90 tons every 24 hours.

PERSONAL inquiry in the districts lying at the east end of London shows that an average of 40 per cent of the highly skilled workmen are unemployed.

MONTANA'S copper output last year was 59,500,000 pounds, an increase of 18,887,217 over the figures for the previous year—about 25 per cent.

Mine Timbering.

The methods employed in timbering shafts and drifts are very much alike all over this coast. The system adopted for preventing the caving of excavated ore bodies originated on the Comstock, and was described by Hague in the volume on "Mining Industry" of King's Geological Exploration of the Fortieth Parallel. We have heretofore given engravings of this system. The framing of the timbers at Eureka, Nev., however, presents some peculiarities to which Mr. Curtis, in his monograph on the Silver Lead Deposits of Eureka, calls attention.

As a rule, the limestone comprising the ore-bearing zone requires but little timbering where it is penetrated by drifts and winzes, and it is only when it has been crushed to a powder that workings of this character need to be kept open by timbers. Where drifts have been run along the line of the quartzite and limestone contact, timbering is always necessary, as the quartzite and accompanying clay scale off and in course of time fill up the drift. Drifts in the quartzite itself stand better, but, nevertheless, often require timbers, especially where there is much water. There are but few workings in shale, but if there were, much timbering would no doubt be required to keep the ground open for any considerable length of time. Shafts and winzes in the limestone of course require some timbers, but usually no more than are necessary for the support of ladder-ways. Below the water level the limestone stands very well, owing partly to its nature and partly to the compact nature of the rock as depth is attained.

The engraving on this page represents a complete set of rectangular timbers, as they are used in carrying up a stope in an ore body. These timbers are similar in their general features to those in use on the Comstock. It is only as regards the manner in which they are framed that they differ, and even in this respect the differences are slight, though worthy of attention. We shall give in next week's PRESS engravings of the ties, caps and posts, with accurate dimensions, etc., showing exactly how the framing is done.

THE CHASE HEIRS INTEREST.—The Department of State has been hesitated with numerous questions regarding the \$800,000,000 supposed to be in the Bank of England, awaiting distribution among the Chase-Towneley-Lawrence heirs, and Secretary Ayard has issued in reply a long circular letter, based on information from our minister in London, in which he strongly advises the inquiring parties to "pay no attention to any reports or statements of associations in reference to claims on the above-named estate," and not to "pay any money to agents for prosecuting the same." Moreover, private advices from a reliable law firm at the East, convince us that the whole business, on this side of the water, was set on foot by designing swindlers in hopes to entrap and fleece the credulous and unwary.

ACCORDING to the Colton *Semi-Tropic*, surveyors are already in the field looking for the most practicable route for the cut-off between Mojave or Lancaster and the Cajon Pass, by which a saving of 75 miles haul of freight and passenger trains between San Francisco and Colton can be saved.

THE Yreka *Journal* says: It is now stated that the railroad company is hiring white men principally to work on the railroad above Delta, and possibly the road through this county will be built by white labor, which will make lively times in Siskiyou while work is in progress.

EXPERIMENTS on the Staten Island railroad have proven that it is possible to send telegraphic messages to and from railroad trains which are running at a rate of 30 miles per hour.

AURORA, Esmeralda county, is beginning to attract considerable attention and threatens to come once more to the front as a hulsion producer.

THE Moote Cristo mine in Seven-Mile canyon has started up and is producing 60 tons of ore per week. The Cosmopolitan has shut down.

THE President has ordered out the United States troops to quell the disturbances at Seattle and other places in Washington Territory.

PRACTICAL HYDRAULICS.*

PRINCIPLES OF HYDRAULICS.

[Written for MINING AND SCIENTIFIC PRESS by P. M. RANDALL.]

EQUATIONS AND RULES FOR VELOCITY HEAD, LENGTH, DIAMETER, AND VOLUME OF FLOW FOR CLEAN PIPES.

The general equation for the volume of flow is:

$$q = a v. \quad (149)$$

Substituting in (149), the value of $a = \frac{\pi d^2}{4}$ (area of cross section of pipe), and the value of v of (129), noting that $r = \frac{d}{4}$,

$$q = \frac{1}{2} \times \frac{\pi}{4} \left(\frac{2g}{c_f} \right)^{\frac{1}{2}} \left(\frac{h_f d^5}{l} \right)^{\frac{1}{2}} \quad (150)$$

For convenience of notation put,

$$c_r = \frac{1}{2} \times \frac{\pi}{4} \left(\frac{2g}{c_f} \right)^{\frac{1}{2}} = 3.1514 \left(\frac{1}{c_f} \right)^{\frac{1}{2}} \quad (151)$$

$$\text{Then } q = c_r \left(\frac{h_f d^5}{l} \right)^{\frac{1}{2}} \quad (152)$$

Transposing (152) successively with respect to h_f , d , l , and reducing,

$$h_f = \left\{ \frac{l q^2}{c_r^2 d^5} \right\} \quad (153)$$

$$l = \left\{ \frac{c_r^2 h_f d^5}{q^2} \right\} \quad (154)$$

$$d = \left\{ \frac{l q^2}{c_r^2 h_f} \right\}^{\frac{1}{5}} \quad (155)$$

Substituting in Eq. (151), the values of $\pi = 3.1416$, $2g = 64.4$, and of $c_f = .00644$, as a mean coefficient of resistance within the pipe:

$$c_r = 39.27. \quad (156)$$

By reference to Table 16, the coefficient of resistance .00644, employed in finding the value of c_r of Eq. (151), is due a velocity of 2.25 feet per second in a 6-inch pipe, 5 feet velocity in a 3-inch pipe, and 7 feet velocity in a 12-inch pipe. Its range thus appears too limited for general application.

Substituting the value of c_r of (156) in Eqs. (152), (153), (154) and (155), there results:

$$q = 39.27 \left\{ \frac{h_f d^5}{l} \right\}^{\frac{1}{2}} \quad (157)$$

$$h_f = .000648 \left\{ \frac{l q^2}{d^5} \right\} \quad (158)$$

$$l = 1542.13 \left\{ \frac{h_f d^5}{q^2} \right\} \quad (159)$$

$$d = .23034 \left\{ \frac{l q^2}{h_f} \right\}^{\frac{1}{5}} \quad (160)$$

Equations (157), (158), (159) and (160), expressed as written rules are as follows:

Rule 35.—The quantity of flow in cubic feet per second, in a clean pipe, is equal to 39.27 times the square root of the quotient arising from dividing the product of the head, and the 5th power of the diameter, both in feet measure, by the length of the pipe in feet.

Rule 35 corresponds to Eq. (157).

Rule 36.—The head is equal to .000648 times the quotient arising from dividing the product of the length of pipe in feet, and the square of the discharge in cubic feet per second, by the 5th power of the diameter of the pipe.

Rule 36 corresponds to Eq. (158).

Rule 37.—The length of a pipe is equal 1542.13 times the quotient arising from dividing the product of the head and the 5th power of the diameter by the square of the discharge in cubic feet per second.

Rule 37 corresponds to Eq. (159).

Rule 38.—The diameter is equal to .23034 times the 5th root of the quotient arising from dividing the product of the length of the pipe in feet, and the square of the discharge in cubic feet by the head in feet.

Rule 38 corresponds to Eq. (160).

Rule 39.—The values of quantity of flow, the head, length of pipe, and diameter of pipe are found by Table 17.

Case 1st.—Quantity of flow being required, divide the given head by the given length, both in feet. Find in "sine of slope" column, the sine equal to this quotient, opposite which, in discharge column for the given diameter, will be found the quantity of flow sought.

Case 2d.—The head being sought, find the given

discharge, or nearest approximate thereto, in the discharge column for the given diameter, opposite which, in "sine of slope" column, will be found the proper sine, which, multiply by the given length of pipe. The product will be the head sought.

Case 3d.—The length of pipe being required, find in the discharge column for the given diameter, the given quantity of flow, opposite which, in "sine of slope" column, will be found the proper sine. Divide the given head by this sine, the quotient will be the length of pipe required.

Case 4th.—The diameter being required, divide the given head by the given length of pipe. Find in "sine of slope" column the sine equal to this quotient, opposite which, in discharge column, find the given quantity of flow, or nearest approximate thereto. The diameter for this discharge will be the diameter sought.

Ex. 78.—The head being 40 feet, the pipe 6 inches diameter, 10,000 feet long, what is the discharge in cubic feet per second?

Cal. 1st.—Substituting the given values $d = 6" = .5$ feet, $h_f = 40$ feet, and $l = 10,000$ feet in Eq. (157).

$$\frac{h_f d^5}{l} = (.5)^5 \times 40 \div 10,000 = .000125;$$

$$39.27 \times (.000125)^{\frac{1}{2}} = .440 \text{ cubic feet.—Ans.}$$

Employ Rule 39, case 1st.

Cal. 2d.—Dividing the given head by the given length of pipe, $s = 40 \div 10,000 = .004$, sine of slope.

In Table 17, find the sine of slope, opposite which, in discharge column, for 6-inch pipe, is found the quantity sought—.444 cubic feet.—Ans.

Ex. 79.—A pipe 3 inches diameter, 10,000 feet long, discharges .247 cubic feet per second, what is the head?

Cal. 1st.—Substituting the given values, $d = 3$ inches, $l = 10,000$ feet, and $q = .247$ cubic feet in Eq. (158):

$$\frac{l q^2}{d^5} = (.247)^2 \times 10,000 \div (.25)^5 = 61.7;$$

$$.000648 \times 61.74 = 400.05 \text{ feet head.—Ans.}$$

Employ Rule 39, case 2.

Cal.—In Table 17, find in 3-inch discharge column, .2469 cubic feet, nearest approximate to the given quantity .247, opposite which, in sine of slope column, is found .04; then $h = l s$.

$$.04 \times 10,000 = 400 \text{ feet head.—Ans.}$$

Ex. 80.—If, under a head of 42 feet, a pipe 4 inches diameter discharges .3 of a cubic foot of water per second, what is the pipe's length?

Cal. 1st.—Substituting the given values of $d = 4" = \frac{1}{3}$ foot, $h = 42$, and $q = .3$ cubic feet in Eq. (159),

$$l = 1542.13 \times 42 \times \left(\frac{1}{3} \right)^5 \div (.3)^2 = 2961.6 \text{ feet.—Ans.}$$

Employ Rule 39, case 3.

Cal. 2d.—In Table 17, find in discharge column for 4-inch pipe, .3036 cubic feet nearest approximate to the given quantity .3 cubic feet, opposite which, in

sine of slope column, is found .014; then $l = \frac{h}{s}$; $l = \frac{42}{.014} = 3000$ feet.—Ans.

Ex. 81.—The head of water being 280 feet, required the diameter of a pipe 4000 feet long, that will discharge 80,000 gallons in 24 hours?

Cal. 1st.— $q = 80,000 \div (24 \times 60 \times 60 \times 7.5) = .124$ cubic feet, discharge per second.

Substituting the given values, $q = .124$ cubic feet; $h_f = 280$ feet, and $l = 4000$ feet in Eq. (160).

$$d = .23034 \left(4000 \times (.124)^2 \div 280 \right)^{\frac{1}{5}} = .17 \text{ feet} = 2.04 \text{ inches diameter.—Ans.}$$

Employ Rule 39, case 4.

$$\text{Cal. 2d.—} s = \frac{h}{l} = \frac{280}{4000} = .07, \text{ sine of slope.}$$

In Table 17, find sine of slope .07, opposite which, in discharge column, find .1286 cubic feet per second, nearest approximate to the given volume .124. This is found under heading "2 inches" diameter. The diameter required then is 2 inches.—Ans.

COEFFICIENT OF FLOW.

When the coefficient of flow in a long pipe is $c = 39.27$, the coefficient of velocity deduced from Eq. (130) or (129), is

$$c = \left(\frac{2g}{c_f} \right)^{\frac{1}{2}} = \frac{.644}{.00644} = 100. \quad (161)$$

In which case Eq. (130) becomes

$$v = 100 (r s)^{\frac{1}{2}}, \quad (162)$$

and Eq. (129), by observing that $r = \frac{d}{4}$,

$$\text{becomes } v = 50 \left(\frac{h_f d}{l} \right)^{\frac{1}{2}}. \quad (163)$$

Several standard authors on hydraulics find as follows:

$$\text{Chezy finds } c = 100. \quad (164)$$

$$\text{Eytelwine finds } c = 100. \quad (165)$$

$$\text{Leslie finds } c = 100. \quad (166)$$

$$\text{D'Aubuisson finds } c = 95.6. \quad (167)$$

$$\text{Blackwell finds } c = 95.83. \quad (168)$$

$$\text{Hawksley finds } c = 96.09. \quad (169)$$

$$\text{Bartlett finds } c = 95.88. \quad (170)$$

$$\text{Jackson finds (small pipes) } c = 100. \quad (171)$$

$$\text{Fanning finds (mean for small pipes), } c = 100. \quad (172)$$

$$\text{D'Arcy finds (for larger pipes) } c = 113.8. \quad (173)$$

Substituting the value of $c = 113.8$, as found by D'Arcy, the value of $\pi = 3.1416$, in Eq. (150), and reducing,

$$q = 44.69 \left\{ \frac{h_f d^5}{l} \right\}^{\frac{1}{2}} \quad (174)$$

COMPARISON OF RESULTS OBTAINED BY EQUATION (174) AND BY TABLE 17.

If the head of water be 100 feet, the pipe 1 foot diameter, and 10,000 feet long, the quantity of flow by Eq. (174), will be $q = 4.469$ cubic feet per second, and by Table 17, $q = 4.305$ cubic feet per second.

The head being 16 feet, the pipe 4 feet diameter, and 10,000 feet long, the quantity of flow by Eq. (174) will be $q = 57.20$ cubic feet per second, and by Table 17, $q = 68.50$ cubic feet per second.

When the head is 100 feet, the pipe 6 inches diameter, and 10,000 feet long, the discharge by Eq. (174) will be $q = .79$ cubic feet per second, and by Table 17 $q = .72$ cubic feet per second.

The head being 20 feet, the pipe 8 feet diameter, and 10,000 feet long, the quantity of flow by Eq. (174) will be, $q = 361.8$ cubic feet per second, and by Table 17, $q = 496.4$ cubic feet per second.

These comparisons show that the coefficient, 113.8, proposed as a mean, is too large for small pipes and too small for large pipes; that it is adapted to a pipe 1 foot diameter, with a limited range for either smaller or larger diameters.

They illustrate, also, that the engineer, in the practice of his profession, cannot safely venture far from an established fact in hydraulics, without experiment as a guide.

BENT PIPES.

Bends occurring in pipes resist the flow of water through them.

To determine the additional head requisite to overcome this resistance, Weisbach (partly on the experiments of Du Buat, but chiefly on his own experiments), gives substantially the following formulas and tables compiled from them:

ANGULAR BENDS.

Let h_a = the additional head required to overcome one angular bend.

m = one-half the angle of deflection of the bend.

z = the coefficient of bend or knee resistance.

v = velocity of flow.

$$\text{Then } h_a = z \left\{ \frac{v^2}{2g} \right\} \quad (175)$$

$$z = 0.9457 \sin^2 m + 2.047 \sin^4 m. \quad (176)$$

Table 19 is calculated from Eq. (176).

TABLE 19.

Coefficients for Bend Resistances in Pipe.

m°	10°	20°	30°	40°	45°	50°	55°	60°	65°	70°
z	.046	.139	.364	.740	.984	1.260	1.556	1.861	2.158	2.431

Rule 40.—The additional head required to overcome one angular bend is, in case the head generating the velocity be given, equal to the product of the given head, and the coefficient of bend or knee resistance, due the given angle of deflection found in Table 19; and is, in case the velocity be given, equal to the product of said coefficient and the square of the given velocity, divided by 64.4.

Ex. 82.—The velocity of water in a pipe, in which occurs one rectangular bend, is 10 feet per second, what additional head will be requisite to overcome the resistance of the head?

Cal.—By Rule 40, square of velocity, divided by 64.4 = $10 \times 10 \div 64.4 = 1.553$ feet; $m = \frac{90^\circ}{2} = 45^\circ$, one-half the angle of deflection.

By Table 19, the value of z , corresponding to 45° , is .984; then $1.553 \times .984 = 1.528$ feet, additional head.—Ans.

ENGINEERING NOTES.

Railway Construction in 1885.

The amount of new railway construction completed in 1885 is estimated at a little more than 3000 miles. Although this aggregate rather exceeds than falls below expectation, it represents a smaller addition to the mileage of the country than that of any previous year since 1878. The unfortunate position of railway interests, the unsatisfactory returns of many companies, the widening of the circle of railway bankruptcy, and other influences helped to strengthen the wholesome conviction that too many competitive and premature lines had already been built, and to generate in financial circles a much stronger disposition to repress than to encourage new schemes.

The fact that construction was continued to the extent reported, under the adverse conditions existing, affords another evidence of the force of the extinguishable desire to float new enterprises of varying degrees of merit. In peculiarly auspicious periods it finds expression in annual additions of 10,000 miles or more to the length of pre-existing lines, and even in the face of extraordinary difficulties the additions only dwindle down to about or a little less than 3000 miles.

Nearly all the new construction of 1885 occurred in comparatively new or sparsely-populated Southern or Western States. Operations in Pennsylvania constituted the most notable exception to this remark. A number of short new roads or extensions were completed in this commonwealth.

In the Southern States the additions to new mileage were exceptionally large in Florida, chiefly on account of the influx of northern immigrants and winter residents. In Georgia and North Carolina lines of considerable length were also constructed, mainly for the purpose of furnishing important links in comprehensive rival systems.

More new mileage was completed in Missouri than in any other single State, and Kansas probably stands second on the list. Western extensions of the Missouri Pacific system of considerable significance are now also proposed. The new developments of last year, which foreshadow important labors during 1886, embrace extensions of various northwestern and Pacific lines. The process of pushing new construction into regions in which settlements are expected to follow the railway track has by no means been completed, and many ambitious and strong systems have been formed in the west and northwest, which are eager to keep pace with their rivals in developing new territory. Nebraska, portions of Dakota, Missouri, Minnesota, California and Washington territory were the theatre of considerable amounts of new construction in 1885, and they will probably furnish routes for large additions to mileage during the present and future years.

A NEW METHOD OF PROPULSION OF VESSELS.—At a ship yard in New York there is a vessel under construction and nearly finished, which is very attractive to the curious. It is intended to illustrate a partial solution of the great problem which mechanical sciences has before it, viz., how to avoid the enormous waste of energy that accompanies work. The elemental forces are all in harness, steam having superseded wind and water in the driving of machinery, and electricity already crowding into the place of steam; but, in every case, the result is obtained at a cost which at last has come to be regarded as extravagant. Of the energy developed by the combustion of coal under the boilers of an engine, only a very small percentage is available for driving the wheels of the machine. All the rest is dissipated before it reaches the point where it can be made available. The constructors of this vessel propose to avoid this waste by making the combustion itself the propelling force and driving the boat through the water as a rocket is shot through the air, without the use of machinery and the accompanying loss of energy. This will be done by firing blank cartridges from the stern ports; charges from the forward ports will back her, and charges fired at one side change the direction. The inventors make enthusiastic claims over the expected speed and low cost. The cost of fuel (gunpowder) is stated to be trivial, the claim being made that they will be able to navigate some 180 miles at a cost of 80 cents for gunpowder. As a contemporary says, the vessel may go but its occupants cannot sleep.

A CABLE ROAD WITHOUT GRIPS.—A new system of cable railway is being tried at Binghamton, New York, which is of especial interest, because it dispenses altogether with the grip. Two cables are used, one driven in the ordinary manner by a stationary engine, the second, and smaller, cable taking motion from the first. This second cable is led continuously over a loose drum or pulley fixed under the car. While the drum is free to revolve, the cable simply imparts motion to it and the car does not move, but by the application of a brake stopping the motion of the drum, the car is carried forward with the cable.

The Philadelphia Board of Education will, on February 13th, inaugurate a class for the instruction of teachers in designing and modeling. The experiment if successful, will be of the highest importance to the public schools.

USEFUL INFORMATION.

TO REMOVE GLASS STOPPERS.—After wiping the neck of the bottle quite dry, bring this part over a gas flame, and gradually bring it nearer to the flame, until it has become quite warm. In doing this, be careful not to heat it too quickly (as this would be likely to cause it to crack), and keep turning the bottle around constantly, so that the neck shall be heated uniformly all around. The object of this manipulation is to heat the neck of this bottle only, and by its expansion to loosen its hold on the stopper. To succeed, therefore, the operator must carefully avoid letting the heat strike the stopper, for if this is done it will also expand, and remain as tight as ever. By skillfully turning the neck of the bottle for a few seconds in proximity to a gas flame, a steady pull and twist on the stopper will almost certainly release it. If it should still prove obstinate, a smart tap with a block of wood will generally start it. This simple plan is commonly resorted to in the laboratory, and we have rarely known it to fail. Some prefer to wrap the neck of the bottle with a few turns of a cloth or rag and pour hot water over this, but this will not always succeed, as it is troublesome to confine the hot water just where it is wanted.

SINGULAR ACTION OF GUN COTTON ON BRICKWORK.—Three tall chimneys belonging to Kunheim & Co., of Berlin, Germany, were lately destroyed by means of gun-cotton. The largest was about 147 feet high, and 10 feet diameter at the base. In order that it should fall outward from the city, the charge of gun-cotton (about 57 pounds) was attached in portions to the side next the city, and to the adjacent sides. All three were exploded simultaneously with a magneto-electric apparatus. The chimney, instead of falling obliquely, collapsed vertically, and on inspection the four walls of the pedestal were found to have been driven outward. The bricks were all detached from each other, and nearly all entire. The debris was thrown a very little distance. The two other chimneys, treated similarly, fell as was expected—i. e. obliquely away from the city. One of them, in falling, broke in two about the middle.

JAPANESE CASTINGS.—The Japanese are known to be skilled casters of metals. In the Vienna exhibition there was a casting representing a peacock with drooping and unsprung tail, many of the feathers and their bars representing the appearance of reality, so delicately were they produced. The Japanese employ more time and labor in perfecting metal work than the workmen in any other country. They appear to understand the art of blending colors in metal work. While giving to metal work the most artistic finish, they carefully avoid anything approaching glitter, considering that as beautiful effects can be worked out upon common metals as upon gold and silver. Two of the largest castings in the world are to be seen at Nara and Kamakura, Japan; the one 47 feet high and the other 53½ feet.

The relative value of running leather belts with the grain side to the pulley as compared with flesh side contact has been determined by experiment with substantial accuracy. It is a fraction more than one-third greater with the former than with the latter application. The main reason ordinarily assigned is the advantage derived from the smoother surface, closer contact and better adhesion, but another reason is that it is better to crimp the grain side than to stretch it, as is the case when it is used outside. If a pulley is covered with leather, grain side out, so that two leather surfaces come in contact, grain against grain, there will be more adhesion, which will be increased by using castor oil as a dressing.—*Industrial Review.*

CLEANING MIXTURES.—A good cleaning mixture can be made with two ounces of liquid ammonia, two ounces of soap finely shaved, two teaspoonfuls of powdered saltpetre. Put these in a large, open-mouthed bottle, and add one and one-half pints of warm water. Shake well occasionally. It will be ready for use in two or three days. It is just the thing to use in washing delicate colored articles; also to add to the water for shampooing the head, and a little added to water and sprayed upon plants kills any insects which may infest them, while at the same time it is fertilizing.

BONES IN IMITATION OF IVORY.—A simple and effective method of bleaching bones, to give them the appearance of ivory, has been discovered. After digesting the bones with ether or benzine to recover the fat, they are thoroughly dried and immersed in a solution of phosphoric acid in water, containing one per cent of phosphoric anhydride. In a few hours they are removed from the solution, washed in water and dried.

MEXICAN FEATHER WORKS.—Slow, patient toil is the secret of the marvelous perfection of this beautiful work. A traveler writes: "I tried hard to find out how they made the lovely birds on cards which they offered for sale on the streets. A friend took me to the house of one of these artists. It was a little hovel, where he sat on the mud floor and toiled. But when he heard us coming he put away all his

work and would not let us see it. He was an Indian, with brown skin, and black, straight hair. He wore ragged clothes and had an old blanket to keep him warm at night. Poor as he was, no money would tempt him to show us the secret process he had learned from his father, which had been kept in the family for hundreds of years. Great skill is required to produce a perfect picture. First the Indian traces on the card the outlines of the body of the bird in wax, just enough for the feathers to stick to. Then he begins at the lower part and places them on, one at a time, one row lapping over the other as a slater lays slates. He works slowly and patiently. Perhaps this is the secret of his perfect work, and the reason that no other people have been able to equal him. The result is a bird that looks as though it might sing or fly. The eyes are made of glass beads, and the bill and feet are painted so nicely that they appear to be part of the bird. Then he paints a twig or branch for it to rest on, or makes one from a leather, and his work is done.

ASBESTOS PLASTER.—For several years attempts have been made to produce a fire proof plaster for buildings. As heretofore used the wooden lathing has rendered the ordinary plaster objectionable. Metallic laths do not seem to answer such a desirable substitute as to kill all conditions. A contemporary says: We have lately noticed that a plaster is being made of asbestos, silicate of soda and potash, and without lime or hair, that answers very well. The chemical action of the ingredients forms a hard, stone-like substance, having great cohesive and adhesive qualities. So great is the latter quality that the plaster requires no key or hair to hold it firmly in place, even on the smoothest surface in use in building. Where it is put on iron surfaces, the plaster being an alkali, it has little tendency to produce rust. The adhesive quality of the plaster is such that it will stick so firmly to a plain surface as to require the use of a chisel to separate it from the metal. This plastering can be laid in the coldest weather. If this new material is all that its friends claim it to be, it is certainly something very valuable.

WATER TIGHT BRICK.—A brick being porous, as a lump of sugar, and having six sides, needs careful filling for water tight work in cesspools, etc., and a thin grout of portland cement is commonly used. Heating the brick and soaking before hand in thick coal tar has been recommended. A man may lay common wall all his life without learning how to make brick water tight.

TO KEEP MILDEW FROM WOOD AND CLOTHING.—A solution composed of alum two pounds, water sixty pounds, blue vitriol two pounds, gelatine one pound, acetate of lead one-half pound, thoroughly mixed, will prevent mildew from affecting any wood, clothing, fabrics, etc.

PAPER FROM SEAWEED.—An ingenious Japanese has discovered a process of making paper from seaweed. It is thick in texture, yet sufficiently transparent to be substituted for window glass. When colored it makes an excellent imitation of stained glass.

GOOD HEALTH.

WORKING IN HOT WEATHER.—The Boston Herald joins the New York Sun in combating the widely-prevalent mistake of stopping all exertion when the thermometer rises above the temperate. "Horses," says the Sun, "trot best on the hottest day, and men who have occupation for their bodies and minds fare better in warm weather than those who fold their hands and think of nothing but the temperature." With this the Herald is in complete accord regarding men whose physique is kept in as good condition as that of trotters, but makes exception for men who are not in good training, and for all during humid, debilitating weather. Excellently continues the Herald: "There is no doubt that good intellectual work may be done in the dogdays. The heat opens the pores and gives the body a chance to free itself of impurities through profuse perspiration, which in this age of riding, coddling and luxury it too seldom gets at other seasons, among men of sedentary lives or intellectual pursuits; and whatever purifies the blood helps the brain. The decree to man, 'in the sweat of thy brow shalt thou earn thy bread,' was a blessing, not a curse. And to a cheerful mind and healthy body, hot weather work is more conducive to comfort than is a lazy, a fretful 'stew' about the state of the mercury. Occupation is a panacea for most of the troubles of life."

THE HANDS.—The hands, like the face, require very little covering, while, on the contrary, their usefulness is apt to be somewhat interfered with by gloves. The blood supply of the hand is liberal, and the circulation within it free, and it is thus well able to resist ordinary cold, and to be indifferent to ordinary fluctuations of temperature. Except in quite cold weather, gloves may be regarded as rather ornamental than as necessary to a perfect attire. The continual wearing of tight kid gloves must somewhat impair the circulation of the part, and render the hand attenuated by discouraging the proper use of its muscles. A white and emaciated or "delicate" hand is, however, at the present time admired in ladies, and there is,

therefore, some reason for constant glove wearing. Individuals with feeble circulations, as well as those who are liable to chilblains on the hand and to chapping on exposure, are obviously more in need of some hand-covering than are persons in perfect health. According to Dr. Buck, silken and woolen gloves are more apt to lead to chapping than are gloves made of kid or dog skin. The kid glove, by the density of its structure, affords protection against wind, but as a protection against cold it is comparatively valueless.—*Herald of Health.*

HOW SOME FOLKS EAT.—"There is a class of people who progress with a meal something after this fashion," writes Margaret Sidney in *Good Housekeeping*: "A long draught of coffee, tea, milk or water, as the case may be, begins the performance; this is followed by a mouthful of something solid; only a mouthful, however, for the stream is turned on again down the throat. A glass of water disappears; then the food is attacked and voraciously; again the stream. Once more attention is given to the food, but always the stream has the first consideration. We silently ask and wonder how long the man can stand it. To say nothing of the utter disregard of the laws of health in thus eating and drinking simultaneously, it is an absurd spectacle! A tired, over-heated man drinks twice as much water as he needs, first, because he is so tired he doesn't know what he is doing till he sees the bottom of the glass; the second, because his blood is at boiling mark and the sudden chill is delightful, and he would prolong it till his capacity to swallow fills out. For the same reason he drinks rapidly, that the succession of chills may lower his temperature as speedily as possible. And then he goes out to his stable: 'John, be sure to give Black Prince no water just yet. Rub him down well, John, and cool him off slowly.'"

THERAPEUTIC VALUE OF COAL TAR.—In the *Journal des Usines a Gaz* are given some particulars derived from investigations made to ascertain the effect of coal tar and its derivatives upon the health of the workmen employed in the preparation of those substances. These inquiries were made chiefly in connection with the employees of the Paris Gas Company. It was found that those whose duties did not necessitate a prolonged stay in the parts of the works where tar was to be found, were liable to all kinds of ailments and formed a considerable proportion of the number of the sick list—while among the workmen specially occupied with tar only three were sick in the course of seven years; this result, medically considered, is all the more striking in view of the large number of workmen employed at the period in question—more than 20,000, of whom nearly 800 were employed in some occupation connected with tar. At the Bayonne Gas Works, too, the records show not only an exemption of the workmen from cholera, but also their immunity from skin diseases.

INSANITY AND DRINK.—Statistics show that one-quarter of all the insanity in the world, and in Paris one-half, is caused by drink. In the department of the Seine, in France, there are six times as many lunatics as there were in 1801, while this population is only three times as great. The chief of this "physical" causes producing mental disease is excessive drinking, which is responsible for 562 cases out of the 1,067 admitted in the year. Of the "moral" causes "domestic trouble" stands first, with 59 cases, and after it in order come money losses, alarm, surprise, domestic affliction and religious mania, which last appears to be comparatively rare in Paris. That it is everywhere; drink leads as a cause of disease and crime. The drink curse is more fatal to human welfare than war, famins and pestilence combined.

TOBACCO SMOKING.—A letter in the *Lancet* says: "As the merits or demerits of tobacco appear to be coming to the front again for discussion, I think the following question worthy of attention, viz., How far the injurious effects of tobacco are entailed upon the offspring of smokers? I can call to mind several families of my acquaintance who are delicate, whose fathers were great smokers. The effects of tobacco on the heart and muscular fiber generally are clearly shown in the instances referred to, in an annotation which appeared lately in your columns as having been practiced years ago for the reduction of hernia and dislocations. May not the cases which come before the profession daily of delicate hearts in children be traced to this cause?"

RHEUMATISM AN INFECTIOUS DISEASE.—Rheumatic Acute rheumatism is regarded by many as being caused by germs, just as fever is. The germs cling to houses built on damp ground and rooms where the sun does not shine. In the chronic stage a change to a dry, sandy soil and a warm climate is most desirable; but where this is impracticable a sunny room in an upper story, warm clothing, bathing with much friction, and, if possible to obtain them, Turkish baths prove most efficient means of cure.

LADY PHYSICIAN LUNATICS.—It is reported that one-third of all the lady physicians in England have broken down in the health of the brain and had to be sent to the asylum. This is probably a false statement given out to frighten women from the study of medicine. At least such is not the case in this country.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MOORE.—*Ledger*, Feb. 6: A fine ledge, four feet wide, was struck in the drifting operations at the lower level on Wednesday. The ore is of the regular ribbon character, and shows free gold in abundance. The 10-stamp mill, which has undergone a thorough overhauling under the direction of that veteran mechanic, Robert McLalan, was started on its career of crushing on Thursday morning. It works charmingly in every part. As there are several entirely new features in the construction of this mill, which are believed to be decided improvements, we shall take an early opportunity to describe them fully. The owners of the Moore are now more confident than ever that it is destined to a long and profitable career of gold production.

LAMBING MINE FLOODED.—At 2 o'clock Sunday morning the Lambing gravel mine on Dry creek was flooded. At the hour named a large portion of the levee was pushed inward by the pressure of the flood, and in a twinkling the greater part of the creek's torrent was rushing into the immense pits. The mammoth steam derrick, which represents aalue of between \$4,000 and \$5,000, was saved by being drawn to high ground, a truck having been previously laid for the purpose. Two of the large pumps were also saved, but a third one, which was erected but a few weeks ago, was lost. The mine of late has been paying splendidly, and the flooding of it at the present time is a severe loss. It will be impossible to do anything with the mine till next spring, but then it will be opened up again on a large scale.

MISCELLANEOUS.—The sulphurets at the Amador Queen mine are being hauled to the Sutter Creek reduction works. There is a large amount of them, but they are said to be largely mixed with sand, and consequently will average very low in value. A number of hands at the Mammoth mine were laid off this week, and the mill has come to a standstill for lack of ore. A few men are kept at work prospecting. The future of the mine depends mainly on whether the big tunnel reveals a ledge of pay rock far below the present workings. This tunnel is now 150 feet from where it is expected to strike ore. The gravel claim of J. T. Wheeler is said to be turning out remarkably well this season.

SUTTER CREEK.—The break in the tunnel of the Amador canal, which occurred last week, has been repaired. About fifty-five feet of the timbering gave way. Other repairing in the same vicinity was looked after at the same time. Contrary to expectations, the supply in the reservoirs was not equal to the emergency, and considerable machinery was brought to a standstill, and some had to take to steam. Everything is now running by water again. The supply of wood at the Eureka was exhausted some time ago, and they have been compelled, notwithstanding the terrible state of the roads, to continue hauling every day. Fortunately, they have found small quantities in or near town, which will perhaps run them until the roads improve. The Amador sulphurets works started a few days ago, and will probably run through the winter.

Calaveras.

RED GRAVEL.—*Mt. Echo*, Feb. 5: Rich gravel is being extracted from the Jack Rabbit mine at Dogtown. The extent of this body is not known, but is supposed to be immense. The Bully Bully gravel mine at Monarchville is making a splendid showing at present, and bids fair to become a good paying property in the near future. One day last week Mrs. Moralis, residing at Carson Hill, met with a lucky find in the form of a quartz specimen weighing in the neighborhood of twelve pounds. The rock is a piece of "float," and is immensely rich, being literally speckled with gold. Mrs. Moralis was offered \$300 for the specimen, but refused it, believing that it contained more than the above amount. She has since proceeded to pulverize it.

SHEEP RANCH.—*Cor. Calaveras Chronicle*, Feb. 6: The prop and mainstay of the inhabitants of the town is one mine, that, since its discovery in 1867-8, has become famous as one of the richest and most extensive mines of the county. At present the mine is owned by J. B. Haggin & Co., of San Francisco. The shaft at the central hoisting works is now 800 feet in depth, and the shaft for the 900-foot level has recently been commenced.

El Dorado.

GEORGETOWN.—*El Dorado Republican*, Feb. 5: There are no quartz mines being worked in the immediate vicinity of the town. The Gopher quartz mine near Kelsey is being worked, and report says very successfully. The Slate Mountain quartz mine is the mine on this divide; there is no diminishing of its productions. The three owners have a bonanza; they have shown what perseverance and industry can do in developing a mine. Mr. McKenley, a former resident of Placerville, and Messrs. Burnham and Holt, of San Francisco, are prospecting a mine on North canyon, in which they have great confidence. It is quartz and a deep bank of porphyry. They are putting up a two-stamp mill to thoroughly prospect it before putting up a larger mill. It was reported that the Taylor quartz mine was to be reopened and worked, but nothing has been done on it to the present time. Some work is being done on the Esperanza mine near Garden valley.

Fresno.

PLACER AND QUARTZ.—*Cor. Examiner*, Feb. 8: That portion of Fresno county lying between the San Joaquin river and the Chowchilla river, in which are the Fine Gold and Coarse Gold creeks, the Fresno river and their tributaries, have all been rich in placer gold. The diggings being shallow, they were once worked by rockers and tons, which are yet used, and, water being scarce, mining has been carried on only during the rainy season. Coarse and Fine Gold creeks cannot be depended on for water for more than nine months in the year. The Fresno river, though a longer and much larger stream, does not afford water for more than eight months in the year. I have prospected for quartz in that portion of the country lying between the two creeks named to the head of Potter's ridge, then down the Fresno river, embracing the Coarse Gold, Fine Gold, Potter's ridge and Fresno mining districts, and one would be

astonished at the amount of placer mining done by rockers. Every gulch and ravine shows the evidence of mining by rockers and tons. In following the gulches up you come to where the mining abruptly stops, and there you will generally find a quartz ledge either crossing the gulch at right angles, or only on one side of the hill, showing that the gold must have been washed down from these ledges. From the reports of the old miners who still hang on in that section, it was once very plentiful. Fine Gold creek has been very rich in its yield of gold. In places the quartz is strewn for miles over the surface, and the lodes generally have bold croppings, that may be traced for miles, and prospects may be obtained from most any piece taken. The general course of these ledges is a few degrees east of north and west of south. Their dip is a little south of east, having well defined walls, both foot and hanging, with heavy clay gangue on either wall. Having personally visited the Abby (now the Payson), Hildreth, Hanover, Cunningham, Smith, Quartz Mountain, Mountain View, Oro Fino, Hampton's, Last Chance, Harber, Texas Flat, Enterprise, King's Gulch, Gambetta, Red Rover, McDonald Brothers' mine, Butterfly, Lady Ellen, and many other mines on Willow creek, I can say that all give promise of being good mines, and a great many are now giving good returns to the owners. These mines are all in Fine Gold and Potter Ridge districts. In the Fresno district is the Roils mine, a very heavy sulphur vein. This mine is near the junction of the Coarse Gold and Fresno river. Its quartz is worked by an arastra run by water power. Mr. Marshall, also the Baker Bros., have a very fine ledge of high-grade rock. The Yosemite mine has a shaft down eighty-four feet, showing a fine vein of ore in the bottom of the shaft, with well-defined croppings on the lode. Within six hundred yards west from Green's Station is the Zebra mine, which has more development on it than any other mine in Fresno district. There are three claims of fifteen hundred each and one of seven hundred and seven feet. This mine has two tunnels, respectively seventy-five and one hundred and sixty-five feet. Three shafts have been sunk to the depth of sixteen, forty-five and thirty-two feet, all showing a vein of quartz in every shaft and tunnel from ten inches to three and a half feet. Already there is at the upper tunnel two hundred and fifty tons or more of quartz showing free gold and sulphurets that will work thirty to forty dollars per ton. There is about six hundred tons of ore in sight in the uppermost tunnel. The quartz is very heavy in sulphurets and the assays run from \$129 to \$135 per ton. This property is now incorporated under the name of the Zebra Mining and Milling Company, and the principal place of business is San Jose. The company intends putting a mill on the property immediately. This mining region of ours has a fine climate, pure water, and its hills and mountains are covered with rich grasses; abundance of timber of different kinds; pine and oak, below the snow belt; good roads accessible at any season of the year; cheap freight, and only twenty-five to forty miles from the railroad.

Inyo.

DEFIANCE.—*Inyo Independent*, Feb. 6: The Defiance mine is showing up better than ever, and with every advance made the ore body increases in magnitude. Mitchell's teams are steadily employed hauling ore from the mine to Keeler. A letter from Darwin states that Eddy has struck rich gold at Slate range. Samples of the ore brought in to Darwin are very rich.

MODOC CON.—The ore body in Lookout is still opening up. From foot to hanging there is four and one-half feet of clean ore. Daily output five tons. The usual amount of high-grade ore is being extracted from No. 3 Con. and South Lookout. Will start furnace as soon as sufficient material is on hand. Thirteen miners employed.

THE YGNACIO MINE.—*Inyo Register*, Feb. 6: Preparations are about complete for working this notable old Cerro Gordo mine for all it is worth. The old dumps, which are known to contain large quantities of good milling ore, are to be thoroughly overhauled. A system of thorough assaying will be carried out under the direction of S. D. Woodhull, than whom we have never had a more accurate assayer in the county, and all ores that will pay will be sent to the Hawley mill at Keeler. Work is now being prosecuted about 40 feet below the level of the Potosi tunnel, and with very encouraging results. Ore from the old upper workings will be sent down the deep incline to the Potosi tunnel, with which connection has been made. This will greatly facilitate the work, as no hoisting will have to be done. We are told that on the whole the prospects for the old mine are very flattering, and will wake things up generally before long. The company will be known as the Ygnacio Consolidated Mill and Mining Co. The general direction of the underground work will be under the management of Mr. Geo. Weiss, and the selection of ores, assaying, etc., devolves upon Mr. Woodhull, whose office is at the Ygnacio dwelling.

MINERS' ELECTION.—At the election last Monday, H. A. Man was unanimously elected Mining Recorder for Bishop Creek mining district. This district extends from the Mono boundary south to Big Pine creek, and from the foothills of the Sierras east to the summit of the Inyos.

THE HAWLEY FURNACE.—This institution, under the management of John S. Gorman, has been running right along since the 11th of last month, turning out six and seven tons of bullion every day. The string of ore teams to be seen climbing the heavy grade to Cerro Gordo every morning lends an air of old-time cheerfulness to that region, and, no doubt, the dulcet tones of the gentle teamster, as he prods his straining mules along, is sweeter music to the old resident than that of a tramp brass band.

Mariposa.

FRANCIS.—*Cor. Mariposa Gazette*, Feb. 4: The waterwheel at this mill is a five-foot Pelton wheel making 80 revolutions per minute. It is run by water taken from the ditch by an iron pipe 13 inches in diameter, having two nozzles with a fall of 40 feet and everything about the mill is working beautifully. I was very much surprised to see what an amount of work had been done in such a short time. They have an upraise about 100 feet from the mouth of the tunnel; said upraise runs to the surface; following the ledge a distance of 130 feet the tunnel is about 150 feet beyond the upraise, making a total length of 250 feet. The quartz not only looks well but prospects splendid. They have also a crosscut running west directly under and

parallel with the upraise, a distance of 70 feet, and have struck a ledge which looks well. They are already in the ledge nine feet and no sign of foot wall; they are also building a trail roadway from the mill to a mine below known as the J. D. B., from which mine the mill can be kept running for a long time by four men.

Nevada.

THE COE MINE.—*Grass Valley Union*, Feb. 2: A visit to the Coe yesterday morning showed that the work of opening the old mine was going on in a systematic manner. The lessees of the mine have their water wheel in place, and will have the pump set, and be ready to commence pumping water next week. The wheel is not a very large one, but the lessees think it will keep the shaft free from water, as the ground is not very wet. The machinery is placed over the eastward shaft, which is about 100 feet in depth, and a large ledge shows in the westward drift at the bottom. The Coe, like many other of the dormant mines of the district have proven when worked in a systematic manner, is likely to be a good mining property, and the chances are that it will add one more dividend paying mine to this district. Should it prove as good as there is every reason to believe it to be, the Powning, adjoining the Coe on the east will again be worked. The outlook in that portion of the district is certainly favorable.

AN IMMENSELY RICH STRIKE.—*Grass Valley Union*, Feb. 10: A visit to the Crown Point yesterday afternoon was rewarded by a sight of one of the richest lot of gold specimens ever seen in Grass Valley District. The specimens in question were taken from the slope of the 180 foot level yesterday forenoon, and of a different nature from those taken from the mine on former occasions. The gold is very heavy, being distributed through the rock in solid metallic strings, varying in thickness from a sheet of paper up to an inch or more. The precious metal is not confined to quartz alone, but is seen running all through the slate and soapstone, and no less than \$2,000 were taken from a small portion of the ledge. A great deal more of the same kind has been broken loose, and was to have been sent to the surface during the afternoon. The rock now being run through the batteries is also very rich, and will go far above the average of the last two or three weeks. The work of lowering the pump to the 300 level is progressing, and it will not be many days before that level is free from water, when the southeast drift will be driven as fast as drills and powder can do the work. The whole appearance of the mine is improving as work progresses, and it will not be long before the Crown Point will be classed as one of the best mining properties in the State.

Placer.

DRIFT MINES.—*Virginia Chronicle*, Feb. 5: Col. E. D. Boyle and Robert Kauhut have had a 60-horse power hoisting engine built at the Fulton foundry for the Alta placer mine near Alta station, California, on the line of the C. P. railroad. The engine, together with the mine cars, cages, tanks, cables, etc., will be shipped to their destination next week. The cages were constructed purposely for the shaft, it being smaller than those on the Comstock. The above mentioned gentlemen own the property, and are sanguine that it will pay them handsome monthly dividends as soon as they get everything in running order. The gravel hoisted through the shaft is drifted from the channel of an ancient river bed, the bedrock of which is 200 feet below the surface. The gravel contains an average of \$2 per ton in coarse gold, and they intend to raise and wash between 300 and 400 tons every 24 hours. The cost of drifting, hoisting and washing that amount of gravel is estimated at \$50. This will leave the owners a handsome margin, if they realize only fifty cents in coarse gold from every ton raised and washed. They have a splendid sluice head of water for washing the gravel, which is dumped into the flume from the car when hoisted from the drift, thus saving the expense of hoisting it over again.

WORKING SMOOTHLY.—*Placer Argus*, Feb. 4: Col. Keown, superintendent of the Hazard mine near Michigan Bluff, reports everything working smoothly and satisfactorily. The water has been out of the mine for over two months, since which time a good deal of work has been done cutting down the shaft, squaring and timbering it for the new cage recently put in. About 3000 feet of iron air-pipe has been supplied to the mine, and the workmen are now driving ahead on the main tunnel. The work goes on night and day, three shifts of men being employed. Capt. Hodge, Jas. Hodge and Wm. McCoy are building a new quartz mill on Owl creek near Yankee Jim's. It is to comprise two batteries, which will operate on a new principle by crushing and rubbing rather than pounding the rock from their seven-foot vein. It is said to be an improvement over the time-honored quartz-crushers. They have also put up a 32-foot water wheel. The mill will be ready for operations in a few days.

Shasta.

QUARTZ DISCOVERIES.—*Shasta Democrat*, Feb. 3: Two new rich gold quartz discoveries on Squaw creek are reported to have been made last week. The quartz mill and other machinery for the Croesus mine on Squaw creek is expected to arrive in a few days. F. B. Simonds Sr. is working on the Senior mine on Squaw creek, owned by himself and Barnes, and reports striking a pay chute of rich ore. Hart, Day & Co., who purchased the Fleming mines in Old Diggings district, have got their fine mill running in tip-top shape and are now crushing high-grade ore. Two carloads of selected ore was shipped a few days ago from the Scheerer tellurium mine on Salt creek to the Argo Smelting Works at Denver. Work will be resumed on the mine in a few days. This ore is designed as a working test.

GOOD CLAIMS.—*Shasta Courier*, Feb. 6: Mining near town is all the rage since the storm. Several young men have some good claims and as long as there is sufficient water for sluicing the boys make very good wages. The Decker bonanza on Bulgin Gulch, east of Centerville, will make a big racket in the mining world before many months elapse. The ledge matter is from sixty to three hundred feet in width and assays over \$100 to the ton in gold and silver. A shaft has been sunk on the ore body to the depth of sixteen feet, but the water came in so fast that work had to be suspended for the present. Joseph Decker, the discoverer, is a pioneer Californian, owns property in San Francisco, Plumas county, New River and other places.

Trinity.

NEW RIVER.—*Humboldt Standard*, Feb. 4: We were shown two specimens of gold-bearing quartz from Methodist creek, in the New River region. One of them, in the estimation of old miners, would turn out \$100 to the ton, and the other all the way from \$1000 to \$5000. It is safe to say there is not any too much of the latter rock there. We are informed also that a mine on Know-nothing creek has a rich ledge which yields an average of \$150 a day. The miners have an arastra and are prosperous. New River is not dead but sleeping.

NEVADA.

Washoe District.

CHOLLAR.—*Enterprise*, Feb. 6: Building up the pump column from the tank station on the 3100 level to meet and connect with the Cornish pump on the 2900 level is completed and the pump was started into active operation last night. This will give required facility for sinking the Combination shaft deeper, and that operation will be commenced or resumed as soon as official advices are received to that effect from headquarters in San Francisco. As before stated, the bottom of the shaft is 55 feet below the 3100 level. Meanwhile preparations are being made to resume drifting south on the 3100 level into Potosi ground. It will be remembered that the south drift was stopped a few weeks ago a short distance north of the Potosi line, because of an influx of hot water struck at that point. Drain boxes were put in throughout the drift to carry it off, and now an advance to the southward would be perfectly in order, and most certainly would penetrate a virgin block or section of the Comstock some hundreds of feet below all former explorations.

HALE AND NORCRUSS.—The deep winze which commenced on the 3000 level has now reached the 3200 level, following the regular dip or inclination of the ledge formation to the eastward. It has been in ore of greater or lesser degree of merit throughout, down to the present lowest level, which is the deepest yet achieved in the middle mining section of the Comstock. The winze is now being finished up and put into complete working order throughout, and next in order will be drifting south to meet the drift from the Combination shaft when it reaches that level. A drift north may also be started soon to investigate the good prospects developed by the diamond drill from the level 100 feet above.

OPHIR.—The main west drift from the old Mexican shaft on the 300 level is now in 136 feet, 32 feet having been added since last report. The lateral drift north on the 400 level from the main west drift from the old Mexican shaft is now in 226 feet, material vein porphyry and quartz. On the 700 level the joint Mexican and Union drift running northwest from the Ophir shaft is now in 245 feet, with no new features of interest to relate.

CON. CALIFORNIA AND VIRGINIA.—The usual amount of ore, about 300 tons daily, continues to be shipped from the 1750 and levels above, average assays from mill samples being about \$14 per ton. On the 1400 level the northwest drift has been extended 32 feet, making a total of 543 feet. The very gratifying dividend of thirty cents per share on this mine is more particularly mentioned elsewhere.

GOULD AND CURRY.—At the Osbiston shaft, owned and being conducted jointly by the Gould and Curry and Best and Belcher mining companies, the pumps have been doing very noisy and effective work since they started. Last evening the water was lowered in the shaft to the total extent of 146 feet with 46 feet further to go to reach the third line of pumps.

UNION CONSOLIDATED.—The main east crosscut on the 500 level is now in 592 feet and making good advancement in favorable working ground. The progress of the joint Mexican and Union drift northwest on the 700 level is mentioned elsewhere in the Ophir report.

YELLOW JACKET.—The Brunswick mill is kept steadily running on ore from this mine. The mine is looking and yielding as heretofore, with no new points of interest to make particular mention of.

SIERRA NEVADA.—The main lateral drift north on the 520 level has been extended 63 feet making a total length of 1638 feet. Material dry vein porphyry with streaks of quartz and clay.

MEXICAN.—On the 500 level the main lateral drift north from the east crosscut is in 405 feet. Material vein porphyry with streaks of decomposed quartz and clay.

ALTA.—The lateral drift on the 700 level toward the Benton ground is making steady advancement in good working ground.

CROWN POINT.—Ore extraction and milling run up to the usual standard.

MISCELLANEOUS.—The small outside mines and mills down Six-mile Canyon, Silver City and elsewhere, including the mills on Carson river, are now running all right.

Bell District.

DEVELOPMENT.—Belmont *Courier*, Jan. 30: Ernst & Esser are still pushing the work of development in their mines in Bell district, Esmeralda county. The mines of this district will attract considerable attention at no very distant day. The ores are of a smelting character, and the mines, as soon as properly opened, will produce a sufficient quantity of ore to keep two or three furnaces running steadily. Nevada has more mines than any other State in the Union, and all they want is a fair show and they will speak for themselves.

Como District.

COMO-EUREKA.—*Virginia Enterprise*, Feb. 7: Bennett Symons, was in the city a day or two ago, direct from Como. He brought in some samples of ore from the Como-Eureka mine, from which four assays were made with the following results per ton: \$27.47, \$29.58, \$82.43 and \$173.93. The proportion of the gold to the silver is about 40 per cent, like the general average of the Comstock ores. This good result was from wheelbarrow samples, the ore coming from the winze sunk below the 150 level. A handful of the ore is taken from each wheelbarrow load that comes out and thrown into a box, thus giving a fair average of the ore extracted. The last mentioned and highest assay, however, was from a good-looking single lump of ore. They are working hard to get out ore enough for a milling run, which they feel assured must be a paying one. In the North Rapidan they are extracting and sorting ore from the

upraise above the 160 level, and accumulating for another milling run when the state of the road will allow of hauling to Dayton. This raise is up 75 feet in good ore, showing no wall on either side. The great mass is of low grade, with streaks and bunches of rich black sulphurets. There is many a thousand dollars in sight, and the average of the ore worked thus far—\$31 per ton—proves it to be the first really paying mine in Como, although the Como-Eureka will, no doubt, follow suit in that respect.

Columbus District.

HOLMES.—*True Figure*, Feb. 3: In the Cross development we are getting some good ore. Sixty feet west of Cross development we have a good slope of ore. It is developed to a length of 40 feet and will average two feet wide. The Creer looks exceedingly well. The slope is increasing in length. It is 12 feet wide and the ore is good milling. The drift running west from the Creer looks well. The silver stop, fourth level, looks well. We have 20 inches of good sulphure ore at this point. We have changed from mill No. 2 to mill No. 1. We are running the battery to 102 drops with seven and a half inches fall, and we think we will be able to work 55 to 60 tons per day. The mill is doing splendid work—we think better than it ever did.

MOUNT DIAULO.—Cutting out the station and shaft for the eighth level. The south crosscut from the west drift on the fifth level is in 27 feet and we are taking out a little \$30 ore from a streak cut by this crosscut. In the intermediate between the fourth and fifth levels we are drifting on a small streak of \$200 ore that looks promising. The drifts from the mine east of the shaft between the fourth and fifth levels both show a little ore of high grade. We are raising on the ore above the west drift. On the fourth level the raise is now up 22 feet and shows two feet of \$60 ore. The raise from the intermediate drift between the first and second levels near the Callison mine is up 66 feet. This raise has shown about three feet of \$50 ore for the last 40 feet and the face now shows about this amount of ore.

Ione District.

PROSPECTING.—*Belmont Courier*, Jan. 30: There are still a few chloriders taking ore out of the mines of Ione. Their faith is strong that that camp will be a daisy some day.

AT WORK.—*Belmont Courier*, Jan. 30: R. C. Langworthy continues the work of development in the Indianapolis mine at Ione.

Jefferson District.

ORE.—*Belmont Courier*, Jan. 30: Work in the Great Mogul mine, Jefferson, is progressing steadily and some very nice looking ore is being extracted.

Manhattan District.

PROGRESS.—*Belmont Courier*, Jan. 30: Work is progressing steadily in the mines of Manhattan district under the able superintendence of County Treasurer Adam McLean.

Northumberland District.

CHLORIDERS.—*Belmont Courier*, Jan. 30: Nothing is being done in the mines of Northumberland district. Chloriders might find a worse field to labor in.

Pennsylvania District.

A THREE-FOOT LEDGE.—*Pioche Record*, Jan. 30: From J. Penjade, who has just visited Pennsylvania district, we learn that G. K. Barton, who now owns the property, is pushing work ahead with much energy. The mine shows a three-foot ledge of good free-milling ore, in a sort of granite formation, the ledge being very regular and well defined. Some two hundred tons of ore on the dump insure plenty of that material with which to start. Charley Koden, with five men, has about completed the half-mile road from mine to mill. The grading for the mill is completed, the engine-bed in place, and the battery block ready to lower into the pit near which it lies. Both engine-bed and battery block will be set in solid granite. With some trifling exceptions all the machinery is now on the ground. The mill will have five stamps and two large pans, its capacity being estimated at 8 tons or more per day. The amount of work so far done by comparatively a few men is surprising. It would be still more so were it not for the fact that Barton has selected with rare good judgment the best ore that could be had for each branch; and his employees seem to be as much interested as himself in making a speedy as well as a thorough job. The air of life and practical work that pervades the little colony is refreshing to a visitor from Pioche. The men are all healthy and their vigorous out-door employment gives an additional flavor to the splendid fare; for Barton and his men live on the fat of the land. Anyone visiting the district will find it to his advantage to stop over night at Dutch Flat, where the Mesdames Phil and John Smith provide most excellent entertainment.

Taylor District.

EEBERHARDT MONITOR.—*White Pine News*, Feb. 3: Such is the name of the English company into whose hands the Monitor mining and milling property of Taylor has been consigned by purchase. The property was sold last week for the sum of \$175,000. Capt. Frank Drake, through whose negotiations the sale was effected, is superintendent of the company and will manage its affairs here. Of his well-known qualifications for the position it is needless to refer. He has been identified with the mining interests of White Pine since the dawn of that industry. How soon he will commence active operations on the newly-acquired property we are not yet able to say, but it is probable he will resume work in the mine right away. The mine is in good working condition and looks better than at any time in the past. All the buildings, including the late owners' residences, went in sale, but Capt. Drake will not disturb the present occupants till spring.

Union District.

PROSPECTS.—*Belmont Courier*, Jan. 30: The prospects are good for work being done on an extensive scale in the North Belle and other mines of Grantsville belonging to Theodore Cirac. The mines are bonded to J. L. Sanford, of San Francisco, who proposes to open them in good style. The ores carry both gold and silver, some of the rock showing free gold. Union Mining District is under a cloud at present, but the day is not far distant when its mines will be handled as they ought to have been years ago. Mismanagement is the rock that knocked the stulting out of mining in Nye county. Capitalists who have money to invest in mines should be careful and send competent persons to attend to the working of them.

ARIZONA.

WINIFRED DISTRICT.—*Con. Phoenix Herald*, Feb. 4: The mining interests in this district look very bright. The Carbonate Hill mine, owned by Mr. A. J. Pugh, has now a shaft 50 feet deep on the ledge which shows a well-defined vein at the bottom 10 feet wide and between two good walls of porphyry and slate. This ledge has improved from the surface down, in both quality and quantity, and is now without a doubt a paying property and a permanent mine. Prospect results taken from average samples show well in free gold, and the mine is well situated for economical mining with good dumps, tunnels and shafts. In No. 2 shaft, 250 feet southeast from 50-foot shaft, a new ore body has just been exposed, which shows a vein of two feet wide of gold and silver bearing quartz. Samples taken from this ledge assayed \$290 gold and \$121 silver, with a total of gold and silver of \$347 per ton. The quartz looks well, of a bright character, shows some copper stain and considerable of red oxide of iron and carbonate of lead, and is located in good, solid porphyry formation. The Hidden Treasure, situated on the southwest of the Carbonate Hill mine, also shows some very fine gold quartz. Considerable work has been done on this claim in prospecting for the ledge, and until lately no ledge was ever discovered. The character of the ore is much the same as that encountered in the Carbonate Hill mine, and as soon as Mr. Taplin gets his affairs here in good shape he contemplates a trip to Rhode Island, rewarded by the Hidden Treasure and Carbonate Hill properties. There are some other good properties here which look very promising and prospect well in free gold.

FREE GOLD.—*Mr. W. H. Thomas*, who is working the Contention and other prospects out about 20 miles north of town, called at the *Herald* office today and exhibited some as fine samples of free gold as one will see in a lifetime. The gold in the rock, which is much decomposed, is native and takes on very much the characteristics of horn silver. The samples came from the Contention, and if there is much such rock in the mine, it will prove a most valuable gold producing property one of these days.

STRIKE.—*Prescott Courier*, Feb. 5: News comes through Mr. Spence, of Palace station, who came in to town yesterday, of a rich strike in one of the Morgan properties in Turkey Creek district. The mine in which the strike was made is the Victoria, from which some rich ore and a considerable quantity of horn silver were taken last year, while it was being worked by Mitchell and Campbell. Mr. Morgan, who owns the well known Pine Spring mine, lower down the creek, bought out Campbell's interest. The main shaft being down about seventy or eighty feet, Mr. Morgan and his partner concluded to prospect the ledge further south. Two men were accordingly put on to run a cross-cut into the vein, about forty feet from the shaft. After some days work they struck the ledge and found a pay streak fifteen inches across, averaging over two hundred ounces of silver to the ton, in chlorides and horn silver. The strike is about 200 feet north of the south extension belonging to Vanderbilt and Ross. John Hardy and John Wilderman who own the Etta mine, on Cherry creek, are about to put up a steam hoist on their claim. They have a shaft one hundred feet deep, with a large vein of free milling gold ore at the bottom and enough ore on the dump to run their hoist for some time. Mr. R. J. Cartmell, has purchased the Happy Jack mine and will immediately remove 100 tons of ore now on the dump to his Azilan mill. Messrs. Geo. C. Webster and Kidenour, owners of the Honda mine, Hassayampa district, have extracted to tons of rich ore which, we think, be worked by Mr. Cartmell. It is said that Mr. Douglas Gray started his Turkey Creek district mill. Mr. Dawes is tunneling towards the May Bean, and expects to find in it very rich silver ore. Del Pasco mill is crushing gold rock that pays fully \$50 a ton. Mr. Stahl, the assayer, told us, yesterday, that he is now handling a great deal of gold. The auriferous gravel of this country holds millions of dollars worth of gold, but owing to scarcity of water, save in certain months of the year, washing this gold out necessarily is slow work, until plans are devised for saving the water that goes to waste.

COLORADO.

LEADVILLE.—*Herald Democrat*, Feb. 4: Quite a number of prominent mining men are devoting considerable attention to the undeveloped territory embraced within the approximate course of the Iron Silver, Silver Chord and Colonel Sellers' ore chutes. These ore chutes, which as far as known, extend from Rock Hill northeasterly across Iron Hill, and passing through Adelaide Park, continue in their course across the upper portion of Yankee Hill. That this is the general trend of the ore bodies is demonstrated by developments in the Emmett and Crown Point mines on Rock Hill, the Iron Silver, Silver Chord and Colonel Sellers' mines on the southwest slope of Iron Hill, the Louisville and Colorado No. 2 mines, on the east side of Iron Hill, the Park and Mike and Starr mines, on the west slope of Breece Hill, and the Galesburg and other properties on the Big Evans Gulch slope of Breece and Yankee Hills. Between the productive mines above enumerated, there are still to be found extensive areas of undeveloped territory, which will unquestionably prove productive with proper exploration. Between the Louisville and Colorado No. 2 mines and the Park mine are the Horseshoe, Arctic, Laura Lynn, Lady Alice and other undeveloped lodes. After passing the Park mine, which to-day shows one of the finest typical ore chutes in this district, the Minnesota, Loveland, Keystone, Superior, Queen Consolidated, Andy Johnson, Onoto, Galesburg and other lodes are successively encountered. All these lodes and many of the adjoining ones should disclose good ore by sinking to a proper depth. Many of the properties are patented and contain shafts from 150 to 200 feet in depth, but all seem to have stopped just before reaching the desired ore zone. On the Atlantic, a few years ago, Mr. J. L. Loomis sunk the Keystone shaft several hundred feet, and encountered quite a body of ore that did not pay at the time, but which would now yield handsome returns. Realizing this fact, well-informed parties have begun the erection of hoisting works on the shaft, and in a few days will be actively at work and probably producing a good quality of shipping mineral. To the north and west of the Atlantic group is the Queen Consolidated, containing thirteen acres of patented ground of a very promising nature.

This property was located in 1879, but owing to litigation could not be worked until last year, when all controversies were adjusted and work resumed. A large shaft was sunk, which at 170 feet encountered quite a body of argentiferous ore running 20 to 60 ounces in silver to the ton. The shaft is now down 225 feet, and a short distance further would probably take it to the lower ore horizon, on which will be found the silver and lead ore deposits. No work is now being done on the property, the owners having been drowned out by water. While it will cost something to sink this shaft, the results to be anticipated are fully commensurate with the outlay. Almost adjoining the Queen Consolidated on the east is the Galesburg lode, under lease to Judge J. Y. Marshall and ex-Mayor J. D. Flening. This property has lately shipped some fair ore, and discloses a chute of mineral fair in silver and rich in lead, which leaves little doubt as to the extension of the carbonate of lead belt from Iron Hill to the northeastward of Big Evans gulch. The farther east the greater the depth to the ore horizon, as is proved in the Onoto and Andy Johnson lodes, situated to the northeast of the Queen Consolidated and Galesburg mines. The Andy Johnson, according to all reports, disclosed good ore in a drill hole, slightly below the depth of several of its neighboring shafts, and the Onoto, at 325, encountered sulphide of ore four years ago, when this mineral was considered too refractory to warrant treatment. Now it is being reduced at \$10 to \$20 a ton, and the reputation of the Foregang, Colonel Sellers, Minnie and Crown Point mines has since been built up on sulphide deposits, which, with few exceptions, have proved the most profitable in Leadville during late years. We are glad to note that Leadville people have taken an interest in this matter, and trust that the indications so promising to mineral will be found correct, and that a number of new mines may soon be added to the large list of ore producers in the Leadville district.

IDAHO.

LAVA BED.—*Shoshone Journal*, Feb. 5: A boom is expected in the new Lava creek mines, about 35 to 40 miles from Tikura station which expects to do the forwarding business of this lively camp as soon as the wagon road is completed and a daily mail line established. The new wagon road from Shoshone to Camas Prairie, Little Snooky and Rocky Bar, Atlanta, and new North Fork mining districts is progressing finely.

MONTANA.

SILVER MINES.—*Inter-Mountain*, Feb. 3: At present the cost of milling ores has been reduced to a very much lower sum than at the time when most of the silver veins around Butte were opened. Then lodes were abandoned as worthless, which can to-day be profitably worked. The result has been that many mines which have long lain idle are now being developed by lessees, and are yielding satisfactory profits. As a rule, the lessees are working on a small scale; but let them demonstrate the fact that the property they are developing is really valuable, and they will find no difficulty in raising sufficient capital to work it more extensively. We do not wish to convey the idea that the better known mines of the district are retrograding, but perhaps some of them have been as much over-estimated as some of the less developed mines have been under-estimated.

THE UNION CONSOLIDATED.—West of and but a short distance from the Moulton and Rising Star are the mines of the Union Con. Co., consisting of the Goldsmith No. 2 lode, on which a shaft is designated by the company as shaft No. 1; the Batchelor lode—shaft No. 2, the Nonesuch lode—shaft No. 3, and the Belcher lode—shaft No. 4. All these shafts have three compartments, and are covered by large shaft houses containing a complete outfit for pumping and hoisting. Every preparation is evidently being made for extensive work under ground. The timbering is unusually heavy and substantial. All the ore raised goes the Anaconda smelting works. The principal stockholder in the company is Mr. J. B. Haggin, of San Francisco, who is also the owner of the Anaconda and St. Lawrence mines. It is a well-known fact that Mr. Haggin never invests in mining property without being fully convinced by the best expert talent that the mines are valuable, and it is equally well known that when he does take hold of a mine that it is going to be worked in the best manner possible. All that money and skill can do to make it remunerative will be done.

THE AMY AND SILVERSMITH.—The Amy and Silversmith Con. Co., Mr. Lloyd superintendent, are working the Amy and Silversmith lode north of and nearly parallel to the Moulton. The main shaft is 500 feet deep. Last month they sent 180 tons of ore to the mills that averaged from 60 to 70 ounces in silver per ton, and also carried some gold. The first-class ore assays over 400 ounces in silver; this is not kept by itself, however, but is mixed with the lower grades. The mine is looking well, and when the new levels are run the output will undoubtedly be increased.

THE GOLDSMITH.—A short distance northwest of the Amy is the Goldsmith lode, which is owned and worked by George Tong. The east shaft is 260 feet deep, and levels have been opened at the depths of 150 and 250 feet. At present ore is being taken from the slopes between the two levels, and above the first one. About five tons are raised daily at this shaft. The west shaft is on the other end of the mine, about 1200 feet from the one just mentioned. Here they are sinking, and have already reached a depth of 200 feet. About 40 men are employed.

THE PACIFIC.—Messrs. Bateman & Grimes have leased the Pacific mine. Their shaft is on the south vein, and is 70 feet deep. From this they have drifted west 75 feet to the intersection of the south and middle veins, and their have a body of ore about 14 feet in width, which mills 20 ounces in silver per ton. They are running the old Lexington mill, of which Mr. Bateman has charge, and are crushing about 15 tons of ore a day. Their ore is free milling, so that they do not have to roast it.

THE FLAG.—The Flag mine is owned by the Silver Bow Company. Hallahan & Talbot have a lease of it, and are just getting fairly in shape to work. Last week they took the water out and are now prospecting the vein to ascertain the best place to begin work. The shaft is 150 feet deep, from which several levels have been run.

THE WILD BILL.—Jews, Hutton & Co., lessees of the Wild Bill, have their shaft down 235 feet and are drifting west from the bottom. They are also sinking a mine from the 135-foot level. The vein is about 20 feet wide and the pay streak has an average width of about six feet. The ore carries from 15 per cent to 30 per cent in copper, and from 15 to 30 ounces in silver per ton. They have a year's contract with the Orford Co. to supply them with 25 tons of ore per day, and are now hauling it to the mill site where the Orford Co. purpose to erect their new smelting works.

THE GREY ROCK.—Messrs. Saden, McKremmon & Coley have a lease on the Grey Rock mine. They are working on the middle shaft which is about 300 feet deep. Their work is at present confined to the 100-foot levels, which are about 400 feet in length and show a good body of ore. The middle vein carries silver ore, while the south one carries enough copper to render it a smelting ore; the former assays about 40 ounces silver per ton, and \$8 to \$15 in gold.

WAKE-UP JIM.—On the Wake-up Jim they are sinking between the 200 and 300-foot stations, and on the Diamond, which is worked by the same company, they are down 275 feet, from which point they are crosscutting south.

THE LEXINGTON MILL.—The Lexington mill has 25 stamps dropping, and is sinking for the 1000-foot station as fast as possible. The shaft is now about 870 feet deep. No new crosscuts or levels will be run until the 1000-foot station is reached. The Montana Co. have not started yet, though news that will set the mine and smelter going is daily expected.

NEW MEXICO.

ORE.—*Silver City Enterprise*, Feb. 6th: The Young Man Mine at Malone is shipping about one carload of ore a month. M. B. Mikesell brought in some very high grade ore from the Young Man mine at Malone Wednesday. A carload shipment of \$200 ore was made from the Black Hawk mine last Friday. H. A. Brigham is working the Sherman mine with fair results. He shipped a lot of ore to Deming this week. Johns and Dorn have quit work on the Cook's peak mines, and the latter properties are now being worked by other parties. J. B. Malone the owner of the Montana and Tenderfoot claims at Malone, while in town this week informed us he has a carload of ore out for shipment which he intends sending to Deming next week. The shipping ore from these claims averages about \$100 per ton. Hank Dorsey, one of the most extensively known prospectors in southern New Mexico and George Williams have struck a fine body of ore on a claim, west of the town on Legal Tender hill, from which they are daily taking out high grade shipping metal. Encouraging reports have come in daily during the past week from the Providencia mine in Chiricahua Pass, and with them some fine specimens of wonderfully rich ore. The property is under lease to James St. Clair and partner, Almer Enoch is employed in sinking a 100 foot shaft on the Arizona mine at Pinos Altos for working purposes. From the bottom he will cross-cut to the ledge, and then commence the extraction of ore.

LONE MOUNTAIN.—Considerable quiet work has been doing at Lone Mountain lately, and some good results have followed. Ore is being taken out, and shipments, though not large, are quite frequent. The work is being done by men who cannot afford to do any fancy or expensive mining; hence the greatest returns for the least expenditure of labor and money was sought for and generally gained. The numerous small or undeveloped mines of high and low-grade ore at Lone Mountain offer good investments to miners who are willing to take some chances. It has been shown that men can make money leasing such properties, and why this is not done to a greater extent than is the case remains a mystery. The mines are numerous, the veins and ore pockets frequent, and the comparatively low cost of getting the ore to market renders it possible to make a good profit on ore that would not by any means be considered high grade. In the Treasure mine, which is being worked by E. H. Bonner and Albert O'Brien, a rich strike was made on Wednesday last week. The new ore was struck at the outcrop of the vein, and since that time it has been sunk upon to a depth of about six feet.

OREGON.

QUARTZ AND GRAVEL.—*Jacksonville Times*, Feb. 6: Jack Layton is making the gravel fly at his mines on Farris gulch. Miners are happy at last, for there is plenty of water everywhere. S. McConnell and T. J. Neff have purchased Neil Bros. mining claim on Wagner creek. E. Manville has better prospects than ever in his claim on Forest creek and is sanguine of a big run. Many locations are still being made, and our county clerk has recorded quite a number of them during the week. Messrs. Cowles, Kenner and Slagle have located the ledge in Willow Springs precinct formerly worked by Benner & Co. Al. Sturgis has quite a force at work in his diggings on Jackass creek. Fred. Miller and S. L. Fielder among the number. There is not a great deal of snow, at least not as much as the miners would like to see on the mountains later in the season. Now that the quartz mill at this place is an assured fact prospecting has been renewed in this vicinity with renewed energy. The Dry diggings near Grant's Pass are being worked by different parties this season water being plentiful there as well as elsewhere. Ragsdale & Co.'s ledge near Fort Lane promises better results than ever, and they will soon have a large quantity of ore on the dump. Work is progressing favorably at the hydraulic claims of Wimer & Sons, Bybee & Hall, John Haviland and others in Josephine county. An extended run is assured the miners of Jackson and Josephine counties, which means plenty of gold dust when the cleanup is made in the late spring. The recent wet weather is not favorable for quartz mining and prospecting, but it suits the placer miners exactly. All will have their time, however. Several claims have been located on the extension of the ledge recently discovered by Col. Johnson, in Table Rock precinct. An assay of some of the ore showed \$550 to the ton, mostly in silver, it is said. The placers in Josephine county are among the best in the State, and some promising quartz ledges are also being prospected. The capital which ought to be expended in that section would be well rewarded.

TATUM & BOWEN,

91 and 93 FRONT ST., PORTLAND, OREGON.

Manufacturers of

MINING MACHINERY, ENGINES, BOILERS, Etc.

We are manufacturing from Special Designs of the most experienced and successful Practical and Scientific Experts, Complete Plants for all descriptions of Mining Operations, as follows:

CONCENTRATING MACHINERY—Best and Cheapest, Cornish Rolls, all Steel Wearing Parts, Most Practical Styles of Two, Three and Four Compartment Double and Single Jigs, Sizing Screens, Patent Hydraulic Separators, Tables and Concentrators.

STAMP MILLS for Reduction of Gold and Silver Ores, whether free milling or base. Most useful and substantial styles of Single and Double Discharge Mortars, Wet or Dry Crushing.

STEEL SHOES AND DIES, Tappets and Cams, cheapest and best Blake Improved Rock Crushers and Automatic Ore Feeders, Superior Amalgamating Pans with wood or iron sides.

PANS FOR TREATING GOLD ONLY, Settlers, Clean-Up Pans, Retorts, Furnaces, Dump Cars, Hoisting Machinery, Cages, Landing Dogs, etc.

CORLISS, MEYER'S CUT-OFF AND BALL'S PATENT VALVE Engines of extra strength and durability.

STEEL BOILERS of Two Sheets only, Steel Economic Boilers, combining with the safety, durability and economy of the Stationary Boiler, the convenience and portability of the Portable. It occupies but little space, and is the best and cheapest boiler ever made.

WE ALSO MANUFACTURE SAW MILL MACHINERY.

We are also Sole Agents for the Gordon and Maxwell Steam Pumping Machinery, and carry a full stock of all kinds of Mill Supplies, including the

Albany Lubricating Compound and Oils.

Pacific Machinery Depot.

H. P. GREGORY & CO.,

Nos. 2 and 4 California Street,

PATENT

LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Mining Share Market.

The dividend of 30 cents per share of the Consolidated California-Virginia Co., on the Comstock, is the first since the consolidation of the companies, and is of great interest to the stock-dealing public. The Virginia Enterprise states that within the past few months the ore, especially in the lower part of the mine, has more than paid expenses, and given a continual accumulation of money into the treasury of the company, the amount of which was freely reported for public information. There was on hand February 1, \$96,445.92 in coin, and \$52,077.60 in unsold bullion, and it was stated that the clean-up and final bullion shipment on January account, yet to be received, would be large, therefore this dividend was the natural result.

The last dividend on California was fifty cents per share, December 22, 1879, and the last assessment, August 4, 1884, twenty cents per share. The last dividend on Consolidated Virginia was fifty cents per share, August 19, 1880, and the last assessment twenty cents per share, March 12, 1884. Total assessments levied on California, \$1,394,000; total dividends disbursed, \$31,320,000. Total assessments levied on Consolidated Virginia, \$1,113,200; total dividends disbursed \$42,930,000. Total assessments on the two mines, \$2,507,200; total dividends, \$74,250,000. The second and last assessment levied on Consolidated California and Virginia was twenty cents per share, January 15, 1885. There is a vast wilderness of low-grade ore remaining in the mine which would pay well with less cost of production and milling.

The 3,200 level has at last been reached in the middle mines by the Hale and Norcross deep winze, which commenced at the 3,000 level, and drifting north and south from the bottom of it will be next in order, to develop the good ore prospects indicated by the diamond drill in the level 100 feet above. Sinking the combination shaft deeper will be resumed shortly, but at present advices are awaited from below. So, too, with Chollar in projected operations on the 3,100 level. The drainage of the Osiston shaft of the Gould and Curry and Best and Belcher mining companies goes steadily ahead and with very satisfactory progress.

Bullion Shipments.

Oro Grande, Feb. 7, \$4150; Germania, Feb. 2, \$2529; Silver Reef, Utah (for January), \$29,307; Hanauer, 2, \$9890; Germania, 4, \$2532; Hanauer, 4, \$3240; Germania, 7, \$2907; Hanauer, 7, \$2905; Stormont, 7, \$2750; Con. California and Virginia, 6, \$64,136. Following were the ore and bullion shipments from Salt Lake City for the week ending Feb. 6th: 16 cars of bullion, 406,645 pounds; three cars of ore, 76,890 pounds.

Testing and Working Silver Ores

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has been issued by Dewey & Co., Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, extraction of lime, chloride ores, amalgam, Fletcher's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroehnke's process, etc. Under "Pulverizing Machines" are described the arrastra and its construction and operation, stamp batteries, s-reens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noyes's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough barrel on rollers, Aaron's amalgamator, separator, etc. He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 252 Market St.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

OFFICE OF THE Caledonia Gold Mining Company San Francisco, California.

At a meeting of the Board of Directors of the above-named Company, held February 8, 1886, Dividend No. 4, of Ten Cents (10¢) per share, was declared, payable on Tuesday, the 23rd day of February, 1886, at the office of the Company, and at Messrs. Laidlaw & Co., Transfer Agents, 14 Wall street, New York. Transfer books will close on Saturday, February 20, 1886, at 12 o'clock M.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RAILWAY CAR SIGNAL.—Sands Forman, Gold Hill, Nev. This is a means by which the engineer can be signalled from any car on a train, and is also a means by which he is notified if the train breaks in two parts. It consists of a pair of pipes extending from the end of the train and connected with suitable couplings, one of these pipes being connected with an air compressor, while the other is connected with a whistle or other signaling device near the engineer. A means of communication is formed between these pipes in each car with an operating lever or device so that the compressed air from one pipe may be admitted into the other and directed forward so as to give a signal. These devices are also each connected by a rope with the front of the succeeding car, so that if the train accidentally breaks in two the rope will operate the valve and give a signal.

TRAVELING THRASHER.—Newton S. Wilson, South Butte, Colusa county, No. 334,833 dated January 26, 18

DELINQUENT NOTICE.

Pine Tree Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Summit Mining District, Kern County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 24th day of December, 1885, the several amounts set opposite the names of the respective shareholders, as follows:

NAME.	No. Certificate.	Shares.	Amount.

Price, \$6.00, post-paid. Sold by DEWEY & CO., Publishers, 252 Market St., San Francisco.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Office—47 Roce St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St., S. F.

AN EXTRAORDINARY RAZOR

HAS BEEN INVENTED BY THE QUEEN'S OWN COMPANY, of England. The edge and body is so THIN and FLEXIBLE AS NEVER TO REQUIRE GRINDING and hardly ever retting. It slides over the face like a piece of velvet, making shaving quite a luxury. It is CREATING A GREAT EXCITEMENT in Europe among the experts, who pronounce it PERFECT. Two dollars in buffalo handle; \$3 in ivory. Every razor, to be genuine, must bear on the reverse side the name of NATHAN JOSEPH, 631 Clay street, San Francisco, the only place in the United States where they are obtained. Trade supplied; sent by mail 10c. extra, or C. O. D.

San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarrad Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

TUBBS & CO.

611 and 613 Front St., San Francisco.

Dewey & Co.'s Scientific Press
Patent Agency:

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

INVENTORS, TAKE NOTICE!

L. PETERSON, MODEL MAKER.

258 Market St., N. E. cor. Front (up stairs), San Francisco. Experimental machinery and all kinds of models, Tin, copper and brasswork.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them. Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street,

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\\$550.00), F. O. B.

**THE
"TRIUMPH" ORE CONCENTRATOR.**

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$190.15, or \$8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company. In a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, flouted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,

RANKIN, BRAYTON & CO.,
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING and REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER OF INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY OF CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Mine Timbering.

When an ore body is encountered in driving a drift, it is usual to place the first sill across the drift, laying the ties parallel to the drift. This is done to retain as wide a space as possible for the passage of the car, the sills being longer than the ties. In carrying up the timbering the timber which forms the cap of a lower set becomes the sill of the set above it. The same is the case with the ties. In beginning a slope the sills often consist of a long piece of timber in which the posts are mortised at their usual distance apart. As each set is raised the caps are covered with two-inch plank, and in this way floors are constructed. The spaces between the floors and timbers are filled with waste, and thus a compact mass is formed from one side of the ore chamber to the other and from the bottom to the top, which takes the place of the ore removed, and which is capable of sustaining the enormous pressure exerted by the surrounding rock. The timbers are wedged and braced against the limestone walls of the chambers, so that the whole stands solid. It is customary to fill in with waste, as opportunity offers, the absence of that peculiar "crawling" ground so common on the Comstock obviating the necessity for immediate filling. Sometimes the flooring is removed before the spaces between the timbers are filled.

Fig. 1 represents the posts, caps, and ties as framed in the Richmond mine at Eureka, Nev. The tenon of the post is 9 by 6 by 1½ inches; that of the tie, 9½ by 6 by 1½ inches. The tenon proper of the cap is 9 by 7½ by 3 inches, but there are several shoulders on the cap made to fit the spaces left between the post and tie. The dimensions of all these different parts can be seen in Fig. 1 and the manner in which they come together was shown in the article on this subject given last week.

This method of framing is complicated, and therefore expensive, but it is claimed that it gives great strength to the joint. Upon an examination of Fig. 1 it will be observed that the tenons of the posts, and also some of the shoulders of the caps, are cut somewhat short of what would be their proper length if they were framed to meet exactly. This is to allow the timbers to come together easily, as any irregularities in the joints caused either by imperfect cutting or subsequent warping would interfere with their proper fitting were not some space allowed. This is the more necessary on account of the complicated system of joining. Pressure soon causes any imperfect parts to meet.

Fig. 2 represents the timbers as they are framed at the Eureka mine. The tenon of the post is 8 by 8 by 2 inches, that of the cap 6 by 8 by 4 inches, and that of the tie 12 by 8 by 2 inches. The tenons of all these are also cut somewhat scant, but as there are not so many shoulders as in the Richmond timbers they do not need as much play and are easily fitted together. Timber men usually prefer the Eureka to the Richmond method, contending that the timbers are equally strong and more easily framed. The Eureka timbers seem best calculated to resist pressure from all sides, while those of the Richmond offer the greatest resistance parallel with the caps. This would be what was required in timbering an ore body the greatest dimensions of which was along the course of the lode, as is the case with Comstock

bonanzas. In this case the ties would be placed parallel to the walls and the caps at right angles. In Eureka, however, the ore bodies are very irregular and the pressure is usually about the same from all sides. On the first discovery of an ore chamber, too, it is impossible to determine with any certainty what may be its ultimate course, and consequently how the

12, though occasionally they are but 10 by 12 inches. Sets of timbers 10 by 10 inches are sometimes used when the ground will permit of it and the ore bodies are small, but 12 by 12 inches for the posts and caps at least is the rule.

The timbers are cut into the required lengths by circular saws, and framed by hand. Split

METHODS OF FRAMING MINE TIMBERS.

timbers should be placed. It is, therefore, well to have a system of timbering which will be equally effective in all directions. When all the pressure comes from above, which, however, is rarely the case, it would be well to have the ends of the posts rest directly on each other, not allowing the tenon of the caps to intervene.

The usual length of the posts is 6 feet between shoulders; that of the caps and ties 5 and 4 feet respectively. The timber used is pine from the Sierra Nevada. It is hewn 12 by 12, 10 by 12, or 10 by 10 inches square, and is of excellent material. The ties used in the Richmond are 10 by 10 or 10 by 12 inches, as the case may require. In the Eureka they are usually 12 by

lagging and sometimes poles are used in the drifts and small ore bodies where the heaviest timber and planking are not required.

D. H. THOMPSON, an experienced prospector, has discovered a gold-bearing lead near the Elko line, about 30 miles from Willow Creek, Nevada. The ledge, which has been named the Omega, is about fifteen inches wide near the surface, and rich in free gold. The lead is situated in an unprospected range, where there is no mining district.

THE business portion of the town of Flagstaff, Arizona, has been destroyed by fire.

Retorting Amalgam.

The size of the ordinary retort in use is 12 inches in diameter and four feet in length inside. It will hold from 600 to 1000 pounds, according to the quality of amalgam and whether the vent is in the center or upper edge of the end. It is usual now to cast retorts with the vent at the upper edge of the end, and if two vents are made opposite each other in the end the retort can be turned over. This kind of retort is fast superseding the old style, when the vent was in the center of the end. Retorts up to 20 inches in diameter are in use. Retorts are sometimes turned either a half or a quarter revolution after a "helly" has formed on the bottom, but generally they do not last long after turning, and the practice is open to strong objections. The retorts are generally circular in section. Amalgam is not often charged in cups, but is frequently divided by disks of iron in order to save the trouble of breaking up the bullion for the melting pot. The retorting of a charge takes from five to nine hours, according to its size and character. From one-sixth to one-half a cord of wood is consumed per 1000 pounds of amalgam retorted.

The charge is heated slowly to the boiling point of quicksilver, and maintained at that temperature until most of the quicksilver has been expelled, when it is gradually heated to a light cherry red for an hour or so, to expel the remainder. A mixture of salt and ashes is used to swab out the retort and for luting on the head. When the retorting is properly done the loss of quicksilver by distillation is merely nominal. Where the vent is in the upper edge, or the amalgam is not hase, or the pipe is kept open by a rod, the vent does not choke. With dirty or hase amalgam, there is always danger that the vent may choke if it is in the center of the end of the retort.

An ordinary retort will stand from 100 to 300 changes if properly handled, but as practiced, the life of retorts is usually much shorter. Steel retorts have been tried, but it was found they washed too much. The fact that steel turns out sooner than cast-iron would be a sufficient objection to its use. In some small gold mills, where the amount of bullion produced is not large, simple hulk retorts of cast-iron are used in place of the cylindrical ones.

The hulk retorts require no brick fitting and can be used over an assay furnace or a blacksmith's forge, and are convenient for operations on a small scale.

THE new enterprise to supply water-power for the Empire and other mines in the district, says the Grass Valley Union, is now under way, work having been commenced on a ditch leading from the large reservoir of the South Yuba Company to the site of the receiving reservoir of the new company. The work is to be pushed with all possible speed.

PLACER diggings have been struck at Corral canyon, eight miles east of Lewis, in Lander county. The Battle Mountain Nevada says the hedrock dirt pays from \$2 to \$3 per day with a rocker.

A MOVEMENT is on foot in Nevada county to extend some of their big mining ditches to the lower foothill country, where the water can be applied more generally for irrigating purposes.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Virginia City, Nevada.—No. 3.

The Pumping Machinery, Water and Heat in the Lower Levels of the Comstock.

[From Our Special Correspondent.]

Through the courtesy of Mr. A. C. Hamilton, superintendent of the Chollar and Potosi, and Mr. R. Keating, superintendent of the Savage and Norcross mines, and the head carpenter, Mr. W. H. Pratt, the best opportunities and facilities were afforded your correspondent for reviewing the extensive works above ground, as well as exploring the mysterious realms below, and securing a complete inspection of the ponderous and gigantic mechanism planted in the bowels of the earth, at 2400 and 3000-foot levels. At the helm of this whole plant, as principal foreman, we found an old and time-honored reader of the MINING AND SCIENTIFIC PRESS, in the person of Mr. Chas. Matheson. He has been connected with these mines for more than 20 years, and a constant reader of the PRESS for more than 10 years. Like many other principal operators, owners and officers along this Comstock lode, he could not think of doing without the MINING AND SCIENTIFIC PRESS. We hardly need say that in him we found a most thoroughly interested and obliging helper, taking all pains and trouble to point out and explain the interior workings, bearings, modifications, etc., of this

Comprehensive and Most Stupendous Plant.

A plant which he so minutely understands and so easily and skillfully manages. He furnished us a gentleman who presides as foreman of the pump works, Mr. D. Donahue, as our guide in making the detour among the lower levels. We counted ourself fortunate in having secured an escort of such high intelligence, as well as of such rare experience in engineering skill, to conduct us through the vast depths of this underground world. Mr. Donahue stated that he had but recently returned from an European visit, and in his extensive review of mines and mining interests there had met with nothing that seemed to excel or even equal what could be found on the Norcross, Savage & Chollar, in amplitude, perfection and power of machinery. We confess to have received full credit for his assertion when we came to witness the workings of the two

Hydraulic Pump Engines

Planted on the 2,400, 2,600 and 3,000 foot levels, employed to raise the in-rushing waters, the one 800 and the other 1,000 and another 1,900 feet above, to be emptied into the great drain canal running along 1,600 feet below the surface, to wit, the Suto tunnel. Great chambers scooped out of the primitive rock on these two lower levels, somewhat resembling capacious Masonic halls, are the receptacles into which are introduced these ponderous engines to be operated by hydraulic pressure, obtained from the vertical pressure of a column of water about 3,400 feet in altitude. When we witness the expansive effect of water let into the most powerful air-tight wine cask by a pipe only 30 feet high, we can form some faint idea of the multiplied forces and geometrical ratio with which power is brought to bear upon these engines.

When we held up our lamp and observed that the dynameter placed against the granite wall indicated 1,500 pounds to the square inch within these cylinders, we could hardly help exclaiming on the utility of steam rendering any material aid to such machinery appointed to do such work as this. The hydraulic agency exerted through this principle, is the only factor that could here be made available for moving such massive machinery, assigned to perform such herculean tasks. Our attention was specially invited by the engineer to observe the proportional size, strength and quality of the various parts of these huge, underground mechanical leviathans, and to notice how well all the splendid workmanship was designed and adapted to receiving this enormous pressure. When we had fully interviewed these two pumping engines planted at the two levels spoken of, we made a final descent to 3,100 foot level. After a smart walk of several hundred feet, we found ourselves in the Norcross mine. Here, at the termination of a drift, we found quite a group of miners sinking an incline on the main lode, at an angle of about 45°. This incline already extends some fifty or sixty feet, and is presenting a character of ore of no ordinary grade. The specimens which we obtained from this winze are the fairest and apparently the richest of all the beautiful samples that we have yet obtained from the Comstock lode. The lode here is of great width, and all the prospectings are similar to those which have heretofore marked near approaches to other large bodies of ore found scattered along the Comstock lode.

The Cornish Pump.

In ascending to the surface we took a narrow cage that runs up and down beside the long piston-rod that works to the Cornish pump. In explanation, it may be said that there are four compartments in the main shaft, of some six feet each, and the moving piston-rod or pump-bob occupies a part of one of these subordinate shafts. This piston-rod is 2918 feet long,

(to an inch) and 14x14 inches square, composed of iron and wood, well plated, riveted, bolted, lapped, and jointed together. This model piston-rod, of the Cornish pump, is rather an elephant of its kind, and, as we were looking down the dark shaft one day, when it was moving lazily up and down (on the principle, we presume, that great, or long bodies move slowly), we felt inclined to doubt the answer given us as to its real length. Our doubts were wholly removed, as we came up out of the 3100 foot level, having traced it all the way up, and finding it just 2918 feet long. This rod is so long that, had we not fortunately enjoyed the privilege of measuring it, (with our eye) from bottom to top, we should scarcely have dared to commit the matter to the public print, as it might have appeared somewhat incredible, or "snakish" to some of our readers. And now, whoever thinks it rather long can take the trouble to measure it for himself, as your correspondent did. This rod of the Cornish pump is attached to the end of a gigantic walking beam, and is employed on its downward pressure in a forcing pump to raise water from the lower levels to the height of the Suto tunnel (1600 feet below surface), where it is constantly pouring forth its flood of hot water into boxing, that conducts it into that before-named great water-way under the mountain. The Cornish pump removes 650,000 gallons of water per day. But it stands no comparison to the hydraulic pumps that are constantly at work on the 2400, 2600, and 3000 foot levels, as they combined removed, the day before we were at the mine, 3,486,576 gallons in 24 hours and that is considered but an average day's work.

So there goes forth from this one shaft on the Comstock lode, all told, not less than 4,000,000 gallons of hot water every day, with a reserve capacity, Mr. Matheson says, of 1,000,000 more, if so required.

By building up solid granite bulkheads in some of the lower drifts, there has been given a sensible check to a share of this inconvenient element, and where unusual quantities of water are tapped, this ingenious and successful improvement will be kept up, thus affording the mines greater facilities for future operations.

The Great Heat in Deep Mines.

The presence of great heat in these lower levels is owing to the large quantities of hot water entering the mine, and, according to Prof. Backer's theory, may spring or arise from chemical action, or from the ascent of this fluid from volcanic depths below. In either case the suppression or expulsion of it effectually abates the heat and cools off the mine. We noticed in some passages and drifts that the temperature appeared only about as warm as we have experienced it for weeks together in the open air about Tombstone, Arizona, and for similar periods of time in the great grain districts of the Sacramento valley, California. Therefore, no serious inconvenience was met with from this cause, during our trip of about two hours below on these lower levels. The miners, whilst but slightly clad and perspiring freely, are yet enabled, by taking brief respites, at regular intervals, in the cold air chambers constructed for that special purpose, and, filled with cool, fresh air, forced from above to pass through with no great difficulty their allotted shifts of eight hours.

Most manifestly, in principal points of physique, they display the finest and most athletic forms to be found in the various walks of industry anywhere. In fact here, as well as in the C. & C. mine, and generally throughout this camp, every possible convenience and comfort has been provided to render the position of the workmen both safe and agreeable. The officers, too, we have noticed, while generally quiet, careful and thorough, are observed to be courteous, kind and sociable, even among their own workmen, thus establishing a footing at once, both pleasant and satisfactory. We, in common with many others, more deeply interested, look forward to a time—and that not far hence—when the outlay of this combination effort, will begin to unfold its glittering treasures to those who have toiled so faithfully and so long to draw them from these vast depths. Since the first lines of this article were written the news comes to us from Leadville camp that new and most surprising bonanzas have been struck in several parts of that district, and that even on Fryer hill, by deep mining, and contrary to the opinion of the writer in the Mint Director's report, quoted in our last letter respecting these mines and the Iron Silver, they have gone down 30 feet on ore running \$1800 per ton, and the bottom has not yet been reached. The correspondent who has written such glowing accounts of the great resurrection of all the mining interests in Leadville, of January 23d, in the "Financial and Mining Record," New York, says: "The results of deep mining which I urged two years ago are producing their effects." As we gathered up the glowing lines descriptive of that productive industry, we thought down deep in the depths of our heart, When will the responsive echo go back to the bonanza on the top of the Rockies from her toiling twin sister by the Nevadas in triumphant trumpet tones, "Gentlemen, we needed no urging—gone down to the 3200 level and struck the highest and richest bonanza America ever saw." And, from the remarkable specimens of ore that lie before us, and other indications derived from the depth of 3160 feet below the surface, we believe that such a responsive echo will be forthcoming in less than one year from this date.

J. D. P.

Utah Mines.

Silver Reef District.

EDITORS PRESS:—Presuming you have gleaned sufficient of facts and figures from Utah papers relating to this camp, I will only endeavor to add what I think may be of interest to those who have not been here of late.

The property of the Stormont Company is being worked by about the same number of men as have been employed for the past two years, and is producing about the same quantity of ore, namely, about 40 tons per day. The quality of the ore has deteriorated somewhat in the time above mentioned. Notwithstanding this, and the fact that the workings are more wet, more troublesome and more complicated, this property, with continued efficient management, is likely to keep on in the even tenor of its way for many years to come.

The Christy mines are easily producing all the fair-grade ore the mill can crush, and the mill seems to easily get away with the 40 tons per day that the mines produce. These mines have never looked better than at the present time.

The Barber property is now idle.

What now promises to be one of the leading enterprises of the camp, is the new leaching works of Harding & Co., which occupy the place of the machinery of the old Leeds mill. This company has been operating, in a small way, for a year past, but principally on well oxidized tailings. With the new and extensive plant, Cornish rolls, 15 immense tanks, elevators, etc., and capacity for 80 tons per day, a grand success ought to be the result. We can only regret that this company did not purchase the mines as well as the mill, etc., and thereby have one of their own to fall back upon.

The old Leeds mines, which made so many dividends and created so much speculation in the past, are still a source of product to chloriders and to its single owner, in the way of royalty. All chloriders are restricted to a two or three months' lease, and often debarred from hiring help. This seems to work a hardship on those who would like to lay out more extensive work. However, many of the lesses are doing well. Hartman & Pearce, on the termination of their lease, shipped 45 tons and have taken a new lease. Kimple & Lewis have some 60 tons first-class, and over 300 tons of second-class. Other parties have less amounts, but some good ore.

The ores of the Leeds mines average as high as do those of the Stormont Company, and no water to contend with in the deepest workings. The company had all the appliances for producing ore and bullion and, by a comparison between the Leeds and the deep, wet workings of the Stormont mine, we clearly see wherein management has so much to do with the life or death of our mining towns.

At the Butte mine work is going on and a nice grade of ore is coming out. Water has heretofore precluded the development of this mine; but now they have steam-power and pumps, and satisfactory results are anticipated.

Some mines owned by small parties, and by whom they are worked, have shipped considerable ore to the river mill in the past few months. Among them are the Vanderbilt, Lamb & Steel, and Duffin, all situated on the east reef.

I don't think a brighter prospective future has ever presented itself to this camp. Business houses of all kinds have no reason to complain. More visitors and transient people are here this winter than has been for the two preceding years.

Tellurides and Fine Gold.

EDITORS PRESS:—Last December I called attention to the high fineness of the gold in quartz in two mines in this (Tuolumne) county, and near the town of Sonora, viz., the San Giuseppe and the Neale mines, and I stated that I believed the gold from the former to be higher in fineness than that from any other quartz mine in California or any other country. I also asked if gold of such extreme fineness was known to exist in any other locality that the fact he stated through your columns. This article of mine in the PRESS has called forth several notices, among others one concerning the gold in the Lawrence mine, Yavapai Co., Arizona, and in your issue of Feb. 6th, you give a list of quartz and placer mines, 20 of the former and 31 of the latter, showing the fineness of the gold in each. The quartz mines in this list representing the greatest fineness are the Table Mountain and Bald Mountain mines, in this county—they giving each gold of 950 fineness, equal to \$19.64 per ounce. Of the placer mines, not quartz, the highest is that from Spanish Hill, El Dorado Co., viz., 987, equal to \$20.48 per ounce.

Now for the comparison. The last bar of gold from the San Giuseppe quartz mine showed a fineness of 985½, equal to \$20.47. Thus it will be seen that the quartz gold of the San Giuseppe mine is considerably higher in fineness than that from any other quartz mine, and equal, within one cent per ounce, to that of the highest placer mine. The San Giuseppe, therefore, stands to the front of all quartz mines yet heard from in this particular, and it may be added that the fineness of its gold is increasing, the last bar being the finest yet produced, and it may yet reach 1000, equal to \$20.6718—chemically pure gold.

I also notice in your issue of the 6th of this

month that you speak of the discovery in this county of petzite, one of the forms of telluride of gold of great richness, and that the miners, not knowing what it was nor its value, and calling it "white stuff," had been throwing it away. This is true, and I beg leave to say that an article written by myself for the Independent newspaper of this town (Sonora) about two months ago, and copied in the PRESS, attracted the attention at once of the miners here to its true character and great value. It came about in this way: Mr. John Neale, of this town had some exceedingly rich rock coming from his mine, and on inspection of it, at his request, I was struck with its appearance, and after extracting the free gold by amalgamation, I subjected the residue or tailings to various tests and determined its character and announced the fact. I am gratified to say that the discovery has been of great practical value, for the ore formerly thrown aside as worthless is now being most carefully saved for reduction, its extreme value reaching as high as \$60,000 per ton, justifying any, even the most expensive mode of reduction. Mr. Garrett, who owns a mine in the vicinity of the Neale mine, is also availing himself of the discovery and saving the tellurides heretofore regarded as of no value by him.

Two days ago, on trying some ores from Calaveras county I detected telluride of gold—exceedingly rich—from a mine now being developed and not known to contain such ores.

Sonora, Tuolumne Co. LOUIS BLANDING.

Butte, Montana.

[From our Travelling Correspondent, R. G. HUSTON.]

(Continued from our last.)

The different secret Orders are well represented here. Masons have two Blue Lodges, one Chapter, one Commandery. Odd Fellows have two Subordinates, two Eocompments, one Degree Lodge. Knights of Pythias, three Lodges and one Endowment Rank. Ancient Order of United Workmen, Knights of Honor and many others are represented. The Miners' Union is the strongest organization of the town, and seems to be determined to keep their wages at the present rates, and I am truly in sympathy with them, for a man earns all he can get for this kind of work. Although they sometimes may work a hardship on a man having a low-grade ore to work, they will not permit him to employ men at rates that he can afford to pay, but as long as the matter is not brought to an issue there will be no trouble. The union numbers about 1500 in Butte, and own their own building and pay \$10 per week sick benefits, and is decidedly one of the strong influences of the camp.

Substantial Improvements

Have been decidedly the order of the day for the past year or two, as there are many large and well-built, comfortable, home-like, brick houses. From statistics obtained through the kindness of the *Inter-Mountain* and *Miner* publishers, I find that about \$900,000 worth of improvements have gone up here in the past year. It gives a town an air of solidity that it can acquire in no other way to have large business blocks built and also comfortable houses.

It is a bonanza for landlords here, I tell you. I heard of one instance of a man taking agreements and bonds from tenants to pay a stipulated amount for rent for five years, and thus rented his whole building before he put it up or did anything to it. The building cost him \$35,000, and he is receiving \$18,000 per annum, and his contracts run for five years. Pretty safe investment I think, and profitable, too. Rents in good business points are high here—as high as on Market street in San Francisco.

All the different churches have houses of worship here, and from appearance are in a fairly prosperous condition.

There are three hospitals in the city for the taking care of and the treatment of sick. The Alice Mining Company at Walkerville runs a hospital for their men on the same principle the railroad company run one for their men. Each man contributes a small spend from his pay each month; a good thing, for miners are a very improvident set of fellows, and this keeps them in case of accident.

The town has also a district telegraph system and messengers, and also a well-managed day and night telephone service connecting them with the principal points within 100 miles of Butte.

In the line of amusements they have a finely appointed opera house and all of the celebrities passing through stop and give them a few performances. Any theatrical troupe that goes or comes by the Northern Pacific is sure to stop at Butte.

All the different lines of merchandise are well represented here, and by live men who are alert to take advantage of any point in trade at short notice.

Trades of all kinds have their points of business, and each his portion of the trade. There are nearly 500 business firms in the town, to say nothing about doctors, lawyers, contractors, and many others who transact their business through offices.

There are very few failures in business here, which is about the best recommendation I can give any man to go by and to judge of the facilities for doing business here.

The press is ably represented by the *Butte Miner*, daily and weekly, the *Inter-Mountain*, daily and weekly, and the *Town Talk*, daily, and all are doing well.

MECHANICAL PROGRESS.

Working and Tempering Steel.

To work steel never heat above a light cherry red for hammering, says the *Iron Trade Review*, then hammer light and quick until nearly black, as this improves the steel and will make tools that will do more than double the work than if not so treated. The hardness of steel is governed entirely by the heat when it is dipped in water; for instance, a piece of steel dipped at a bright cherry color and drawn to a straw, will be very much harder than a piece heated to a dark cherry red and then dipped and drawn to a straw. Try it.

The forging, hardening and tempering of steel is an art that but few understand, as its knowledge is only gained by experience, and but few ever give its secrets to others; yet in a few words I will try to give the principal elements to workers of steel, which if followed will save you many losses, and give you a reputation for working steel that will insure you good and serviceable tools, as well as increase your gains.

Please remember that the heat at which steel is worked and hardened are two of the vital elements to produce good and serviceable tools. If heated above a light cherry red some of the vitality of the steel is destroyed, and it would in heating too many times return to iron. If heated too hot when hardening, it would fly to pieces, destroying your labor and steel as well as giving you a poor reputation.

Remember also to hammer your work lightly at a low heat, as this improves chisels, drills, lathe tools and edge tools most wonderfully, also take as few heats as possible, as overheating and too frequent heating reduces the steel to iron by destroying the carbon.

To harden taps, rimmers, chisels and drills, always dip them slowly to the depth desired in as near vertical lines as you can by the eye and hand, then move in a circular position until cold, but never any deeper in the water than first dipped, as this prevents them from cracking, which they would be likely to do if held perfectly still and the water formed a line around them. Do not change the water in which you temper, but as it wastes fill up the tank. If you are obliged to use fresh water always heat a piece of iron to put into it and bring it to such a warmth as is perceptible to the hand, as steel is liable to crack when dipped into cold water. When you have heated your article to be tempered take it from the fire and examine to see if any flaws are observable in the steel, as this will prevent your having poor pieces of steel laid to your carelessness in hardening.

In cutting up steel a thin sharp chisel should be used, as a blunt one is liable to splinter or crack the bar, which will not be seen until it is tempered and then the labor is lost with the steel.

Colors of different articles for use.—Taps should be hardened and then brightened by rubbing emery and oil on the clearance, and then draw on a hot plate or in a heated ring to a dark straw color.

Drills for iron should be a dark straw on the cutting part and the rest a blue.

Chisels for iron should be violet color; for cutting stone a purple is required.

Milling cutters should be of a yellowish white. Gear teeth cutters the same color. The usual way to dip these is to have a rod with three prongs to pass through the hole after it is heated to dip with, lower slowly until all the cutter is under the water about two inches, then move in a circular position until thoroughly cold, remembering that a great many things break by taking from the water before they are cold, especially large pieces of steel, as the center retains the heat, and when taken from the water it expands the outside and causes it to crack.

In tempering pieces have a thick and thin edge, always dip the thickest part first. Study the pieces you have to harden and it will help you very much. Large centers in work for tempering should be avoided, as they are liable to cause the end to split open.

The Economy of Compound Engines.

The primary object of compounding, says the *Age of Steel*, is, of course, to secure a higher degree of fuel economy than is possible with any single cylinder engine. This possibility is founded on the fact of the severe internal condensation which takes place on the inner surfaces of the cylinder and piston. This condensation in turn is due to the wide and rapid fluctuation of temperature between the limits of the temperature of the admitted steam and temperature of the exhaust. This statement bas in it a flavor of the theoretical, but in reality there is no phenomenon of steam engineering more practical, and, unfortunately, more unavoidable. Engineers understand this, and users pay for it whether they understand it or not.

With the single cylinder engine there are two methods of boding this loss partially in check—high rotative speed and moderate super-heat. The former is always taken advantage of as far as constructive considerations will allow, and notably in the Reynolds-Corliss engine. The latter is difficult of attainment, and unless carefully controlled is liable to be destructive of

the packing and lubrication of the engine. Compounding acts by dividing the expansion between two or more cylinders, whereby the fluctuation of the temperature on the surface of each cylinder is largely reduced.

Reduced to a practical result, a compound engine well proportioned to its load and pressure, may be expected to develop a horse power on 13 to 11 pounds water per hour, against 18 to 20 pounds from a single cylinder condensing engine. A fair boiler evaporation is 9 pounds water per pound coal, hence something like 1.2 pound coal per horse power per hour, may be expected from judicious compounding. Applied to 400 horse power with coal worth \$4.00 per ton, this means a net saving of \$1,200 per annum—a large interest, truly, on the increase of cost of the engine. Disregarding theory, the results are attested by the fact that in service where cost of fuel is the controlling consideration, as on steamships, in water works, merchant flour mills, etc., compounding is imperative. In Europe, and England particularly, compounding is a rule in manufacturing.

This paper from which we have quoted as above, gives an illustration of what it terms "a tandem compressed engine," in which the two cylinders are placed end ways to each other. The steam is first admitted to the high-pressure cylinder where it is expanded down to within 4 to 6 pounds of the atmosphere; it is then released into the receiver; from the receiver it passes to the low-pressure cylinder, where it is expanded a second time to about 9 pounds below the atmosphere, when it is released to pass to the condenser, thus forming nearly a continuous line of expansion from the boiler pressure down to 9 pounds below the atmosphere, and to this high ratio of expansion is due the increased economy in the use of steam and fuel. This engine is worked with a Corliss cut-off.

Testing Boiler Plates.

We are glad that the engineers of the Manchester Steam Users' Association have introduced severe tests for boiler plates. The pulling or extension tests are applied, we understand, by means of a testing machine, and the strain is increased until the plate is torn asunder. Elongation, as well as the greatest tensile strain, is noted. The bending test is, if possible, more rigorous. Strips are taken of from six inches to nine inches in length, and an inch in width. They are heated to a low cherry red, and then plunged in water of about 80 degrees Fahr. When cold the strips are bent double, the rule being that every one must hinge on a curve, having a radius of not more than one and a half times the thickness of a strip, and it is expected that the bending will be accomplished without any sign of failure being visible. It has been found that steel boiler plates as now made are, as a rule, much more ductile than iron plates. Strips cut from iron boilers have, on being tested, in some cases behaved most unsatisfactorily. They fractured on bending at the slightest departure from the straight line, and on being pulled asunder broke short off without any elongation, showing that they were of a very brittle character and unfit for use in a boiler. Short brittle plates are apt to give rise to dangerous cracks, which lurk at the rivet holes and lie concealed under the overlap, till, in course of time, a rip suddenly occurs and gives rise to an explosion. In view of the serious number and terrible character of boiler explosions, we certainly think that too much can hardly be done in this direction.—*Building World*.

GOING BACK TO FIRST PRINCIPLES.—One of the displays at the Novelties Exhibition, at Philadelphia, bore the startling title of "Doors Hung Without Hinges." Close inspection of the model showed that in places of hinges pivots were employed at both the top and bottom of the door, and located in the architrave. The object of this construction is to avoid the mutilation of doors and the finish about doorways and the unsightliness of hinges. This construction also avoids an aperture between the edge of the door and the jamb when open. Another advantage to which the inventor directs attention is that this construction avoids the friction of from two to ten or more points to each door, as is the case with the ordinary hinges in common use. He further directs attention to the fact that doors which are liable to sag when hung with hinges in the usual manner are, by the use of the pivot, fastened to the architrave, which rests on the floor in such a way as to avoid sagging. For self-closing doors there is used in connection with the pivot a concealed spring, doing away with the ill-looking contrivances sometimes used for the same purpose, and which mar the beauty of well finished doors.

The writer has long had two doors hung in this manner at his residence on Folsom street, in this city, and finds them very convenient. This is simply going back to the first principles and adapting the same kind of hinges which were in general use by the Ancient Greeks and Romans.

CONVERTERS.—According to a return lately issued, there are now 23 steel works in England, having among them 115 converters; Austria and Hungary have 12 steel works, with 34 converters; Belgium 3 steel works, with 18 converters; France 7 steel works, with 34 converters; Germany 23 steel works, with 80 converters, and Russia 5 steel works, with 10 converters.

SCIENTIFIC PROGRESS.

Electricity and Gaslight.

The question is often asked, Can large gas burners successfully compete with the arc electric light? Whether that is so or not, it is quite sure that the people are deriving an important indirect benefit from the efforts which the electricians are making to supersede gas. This benefit is alluded to in the *Gaslight Journal* as follows: The introduction of electric lighting has beyond doubt created a demand for illumination on a greater scale than had previously been deemed necessary. In order to satisfy such demand with gas, without too greatly increasing the ratio of consumption, the employment or adoption of high candle power burners became necessary; and since their introduction we are assured that a much greater lighting efficiency is obtained from a specified quantity of gas than was deemed possible only a few years ago. These burners now being available, the demand for increased illumination can be supplied without a proportionate increase in the consumption of gas—a result which is surely acceptable to the consumer, as well as gratifying to the producer.

To successfully compete with the electric light, it is obviously necessary to employ the same amount of energy, and possess ourselves of a measure of assurance like unto that displayed by our electrical brethren. It is only just to them to say—when we see in almost every city the marks of their progress—they have been pushing and energetic; and we do them no injustice when accusing them of the possession of a large amount of that great American commodity—"cheek." Certainly we need no better justification for making the latter accusation than by pointing to their extraordinary claim of 2000 candle power for their arc lights, and calling attention to their bewildering statements as to cost of producing the same. If the claimed cost of production increases, in practice, in the same proportion as their asserted candle power has diminished when examined through the lenses of actual tests, there is likely to be a collision between claims and facts—with serious results to the former.

Oxygen in Water.

Faraday proved that a gas or vapor is nothing but a liquid at a temperature above its boiling-point, and he liquefied nearly every known gas. It is only within the last six years that the five or six gases which had previously resisted liquefaction have been reduced to that state by perfected modern appliances for producing cold and pressure. At the present time a chemist in Paris is making liquid oxygen by the pound. When gases are dissolved in water, they somehow assume the liquid state therein, and increase the bulk of the water. The harmonic pressure has a feeble influence in causing variation in the amount of oxygen absorbed by water, the variation not exceeding a small fraction of the grain per gallon; yet in a large river that means a variation in the quantity of oxygen to be measured by tons. River water in summer contains about four grains of oxygen per cubic foot, and about five grains in winter. In August, 1859, Dr. Miller ascertained the proportion of oxygen in the Thames at low water, and found that, as it runs through London, the quantity of oxygen in it diminishes as compared with the proportion it contains at Richmond. About 12 or 13 tons of oxygen are lost between Richmond bridge and Somerset house.

Other chemists have since taken up the work, and their results agree quite closely. Tests of the Thames water show that near the London sewage outfall, it contains but about half a cubic inch of oxygen per gallon, instead of two cubic inches per gallon as above the city; but lower down the proportion of oxygen rises again, until the water is within 10 per cent of its richness in oxygen at Richmond. Thus the considerable power which flowing water possesses of keeping itself sweet and clean is no longer a matter of speculation, but one of positive proof. Still the power, great as it is, may be overtaxed, and often is overtaxed in some cases, when the organic matter is non-living. As to whether it has the power of destroying those minute living organisms which are the germs of certain diseases, there are at present very great differences of opinion among chemists.

THE LICK OBSERVATORY.—The successful casting of both portions of the object glass for the great Lick telescope, and its rapid approach to a finish in the hands of Mr. Clark at Cambridge is drawing much attention to the important observatory on Mount Hamilton, in this State, where the telescope is to be mounted. It may be interesting in this connection to refer to the object and conditions of this princely gift which will approach to near \$1,000,000 of outlay. So far as Mr. Lick's intentions are concerned they may be inferred from the language of the trust deed, which provides that as soon as the telescope and observatory are completed the trustees shall convey the same, together with all the machinery and apparatus connected therewith and the ground upon which the observatory is built, to the regents of the State University, and that the telescope and observatory are to be known as the "Lick Astronomical Department of the University of California."

This seems to imply an intention that the observatory and its appurtenances should be as much an appliance of the University as the apparatus belonging to the department of natural philosophy or chemistry, or any other department; and that the extent or restriction of its use was a matter to be entirely within the control of the Board of Regents. The fact that Mr. Lick provided for and directed the construction of a telescope superior to and more powerful than any ever yet made had a meaning. It is evident that he did not contemplate that a telescope of that description should be used merely for instructing a class of pupils in astronomy. The uppermost thought in his mind was, without doubt, celestial exploration and discovery in the general promotion of astronomical science. This is certainly a most reasonable inference.

Extinction of American Animals.

Mr. Ernest Ingersoll, in a paper just published by the American Geographical Society, makes a startling record of the extinction of wild animals from this continent by the settlement of the country. Much of this lamentable decrease of animal life was unavoidable. But Mr. Ingersoll does well to descend upon the ruthless waste of one of our most valuable resources. Only twenty-five years ago the great plains were covered with buffaloes, and Mr. Ingersoll says: "I myself have seen steamboats halted on the upper Missouri by swimming bands of these finest of wild cattle." But the extension of the Pacific railways has been made the occasion of a needless extermination of them. The elk, moose and deer have suffered a similar fate, until now it is said that the elk, which eight years ago were seen in thousands on the plains of the Sweetwater and in the Wind River mountains, have practically been driven to their last refuge in the Southern Rocky Mountain plateau.

Mr. Ingersoll shows that this baleful disturbance in the natural order of animal life is not limited to the land alone. Seals, which once disported in the Atlantic surf along this coast southward to Cape May, have retired to the Newfoundland or Labrador coast. The habitat of the oyster on our Atlantic coast has seriously decreased. The feathered tribes, especially the prairie chicken, the wild turkey, ducks and all game birds, have been sadly depleted, and still the slaughter goes on almost unchecked.

Mr. Ingersoll suggests that an arrest might be put upon this uncalled for destruction by making and enforcing "a law which should permit so-called sport to be indulged in only by a selected few who had proved their capacity for common sense and self-restraint."

The Wonders of the Sea.

The sea occupies three-fifths of the surface of the earth. At the depth of about 3500 feet waves are not felt. The temperature is the same, varying only a trifle from the ice of the pole to the burning sun of the equator. A mile down the water has a pressure of over a ton to the square inch. If a box six feet deep were filled with sea water and allowed to evaporate under the sun, there would be two inches of salt left on the bottom. In the many bays on the coast of Norway the water often freezes at the bottom before it does above.

Waves are very deceptive. To look at them in a storm, one would think the water traveled. The water stays in the same place, but the motion goes on. Sometimes in storms these waves are 40 feet high, and travel 50 miles an hour, more than twice as fast as the swiftest steamer. The distances from valley to valley, between the waves, is generally 15 times the height; hence, a wave five feet high will extend over 75 feet of water. The force of the sea dashing on Bell Rock is said to be 17 tons for each square yard. Evaporation is a wonderful power in drawing the water from the sea. Every year a layer of the entire sea, 14 feet is taken up into the clouds. The winds bear their burden into the land, and the water comes down in rain upon the fields, to flow back at last through rivers. The depth of the sea presents an interesting problem. If the Atlantic were lowered 6564 feet, the distance from shore to shore would be half as great, or 1500 miles. If lowered a little more than three miles, say 19,680 feet, there would be a road of dry land from Newfoundland to Ireland. This is the plain on which the great Atlantic cables were laid. The Mediterranean is comparatively shallow. A drying up of 660 feet would leave three different seas, and Africa would be joined with Italy. The British channel is more like a pond, which accounts for its choppy waves.

THE PINE LUMBER SUPPLY.—How long will this wonderful work among the pines continue? The stock of pine yet standing in Michigan can produce 40,000,000,000 feet of lumber if cut for the purpose. In eight years, therefore, at the last average production of the State, the pine will have been used up. But such predictions have been made for years past. In 1867, the standing pine of Michigan was estimated to be 52,416,000,000 feet, and it was predicted that it would be all gone in seventeen years. But since then the Saginaw valley alone has produced about 12,000,000,000 feet, and will continue to cut in the neighborhood of 1,000,000,000 feet a year for eight or ten years to come. As pine grows scarcer, it will make more lumber than when it was plenty.

Passing Events.

The silver question is attracting great attention just now and the anti-silver men seem to have gained a temporary advantage by the very unexpected report of the coinage committee, voting against free coinage.

Very rich gold quartz has been brought into El Paso from the old placers of Guadalupe, Alameda county, State of Chihuahua, Mexico. The placers have now become a husy mining camp, and Americans as well as Mexicans are flocking thither in search of gold. The great scarcity of water in the locality makes this commodity command a fabulous price. A number of the residents of the State of Oaxaca were the first to uncover the new fields. The city of Chihuahua is much excited over the find.

Very severe cold weather in Alaska has caused the shutting down of the big gold mill at Douglass Island.

With the lengthening of the days the prospectors will begin to start work again in the mountains. Most of the gold-bearing regions of this coast will be pretty well searched over this spring and summer, gold mines being in demand.

THE El Callao quartz mine, Venezuela, of which H. O. Perkins, of Nevada county, is superintendent, gave a yield for November of \$211,453, from which a dividend of \$77,280 was declared.

THE United States Circuit Court has decided the suit of Vincent Elbert against D. Jones, in favor of the defendant. The suit involved the ownership of the Mono Lake hydraulic mine.

Coarse Grinding of Gold Quartz.

Mr. J. A. Johnson, of this city, has recently been making some experiments with gold-bearing quartz, the results of which are of interest. He had several batches tested by milling process though this saved only 41 per cent, from ore that assayed \$25.11 per ton. This was crushed wet, passed through a 40-wire screen, and amalgamated in the ordinary way. This result was, of course, very unsatisfactory, as about 60 per cent of the value passed away into the tailings.

Tests of the ore were then made on the Stiles grinding mill. The ore was crushed fine enough only to pass through a 20-mesh. As Mr. Johnson terms it, the quartz was "just cracked," and the little pieces of gold freed so as to fall out without being ground up. We examined this pulp under a glass, and the little pieces of gold appeared just as they evidently were in the matrix. There was no sign of attrition upon them. The result, whatever the reason, was a very great improvement over what the stamps and fine crushing had done. He finds he takes over 60 per cent of the gold out in this first coarse grinding, and then the second grade is run through again. Mr. Johnson says he can, with one machine, crush 10 tons a day with two-horse power.

The mill which ground the quartz is one invented by Wm. C. Stiles, and this is its first real practical trial on auriferous quartz. Mr. Johnson, after the tests, bought the mill and will order others. In this mill there are conical corrugated disks mounted on parallel shafts, two cones being placed back to back upon one shaft and revolving between two other conical disks mounted on the other shaft, so as to revolve close to the faces of the double cone.

The frame has hoxes on the side for the shaft, upon which are fixed disks having conical faces, the apexes of which converge toward the shaft. Upon these conical-faced disks are fixed sections, the inner faces of which are ridged or corrugated to form grinding surfaces.

The other shaft has also disks with corrugated sections similar to those described, but on these the apexes of the conical faces diverge from each other as they extend toward their shaft and their bases are close together. The disks are sufficiently separated to allow the double cone upon the other shaft to fit between them. The angles of the conical faces being the same, it will be manifest that those upon the latter described disks will fit between those upon the other disks, the contiguous faces running parallel with each other.

In order to prevent the ridges on the grinding surfaces from coming into contact with each other, if the cones should be adjusted so as to touch, narrow flanges are formed around the exterior and interior edges of the grinding sections, and a little higher than the corrugations, so that these flanges will touch and prevent the corrugations from rubbing against each other.

The grinding sections are preferably formed of steel, and are so secured by bolts that they are removable and changeable. The hoxee in which one of the shafts turns have lugs which pass down through slots in the frame and through holes in rods or bars beneath, to which they are secured. These bars or rods extend horizontally beneath the frame and through holes in its end, by which they are guided and held in place. Strong springs act upon the ends of the bars, which project beyond the ends of the frame, and thus draw them with the hoxes and the double cone toward the cones between which it travels. If any hard, unyielding substance should pass between the cones, the springs would allow them to separate until it passed.

Material is fed into a hopper and discharged from it between the contiguous surfaces of the cones and is discharged, as ground, below. A pulley communicates motion to one shaft and its cones, while the other cone is driven by the friction created by the passing material, or by direct gearing, if desired.

THE Bald Mountain Extension drift mine, Sierra county, in its cleanup for January, beat the well-known Young America mine, of Sierra City, by about \$3000. After paying current expenses for the month, and a dividend of \$6000, there remained a surplus of \$5000. This was from only four weeks' cleanups, one of which was 417 ounces.

Roasting Silver Ores.

Silver ores which require roasting before they can be amalgamated are of very varied composition. There are some ores which contain so little sulphur that only an incomplete chlorination is obtained unless sulphur, either in the form of blimstone, or iron pyrites, or of copras, is added before the ore is introduced into the furnace, sulphur in some form being necessary for the decomposition of the salt and the liberation of the chlorine. There are other ores, on the contrary, which contain so much sulphur in the form of sulphides that a long oxidizing roasting is necessary before they can be prepared for chlorination. The typical roasting ore is quartz containing silver minerals and from ten to 15 per cent of iron pyrites, with a slight admixture of copper sulphides. Calc spar, fluor-spar and haun-spar, if present in any quantity in an ore, retard the chlorination, as they absorb a large part of the sulphuric acid. Arsenic and antimony minerals increase the loss of silver by volatilization. Zinc blende requires a long oxidizing roasting to convert it into sulphate, and then a high temperature must be maintained before it will decompose the salt. Where there is a large amount of zinc in the ore the chlorination is an imperfect one. Lead and copper contaminate the amalgam and hullion. All these minerals involve the use of a large percentage of salt in roasting, but if present in only small quantities they do not perceptibly effect the chlorination.

In mixing ores the sulphur and silver contents of the charge are kept at those percentages which have been determined in actual practice to be the most favorable under the circumstances to the chlorination of the silver. The effort made to obtain rational rules as to the most expedient relation of silver sulphide, salt, etc., was a failure, according to the report of the various officials, most of the managers having determined their mixtures empirically and knowing nothing definitely of the percentage composition of these ores. The richer and baser the ore the more salt it requires.

Stamp Out the Frauds.

Let every honest minded citizen speak out and make infamously odious the lottery frauds that are sapping the life out of legitimate business enterprise in this State, destroying the business and social morality of people all over our land. Look with righteous contempt on all who have anything to do with this corrupting business and moral leprosy that is now stalking through the land and claiming its victims among the high and low, rich and poor, young and old. Having lately found a rich customer in California, the managers of Southern lotteries are now making special efforts to reap a rich harvest of California "gulls." They have distributed a few prizes where they are calculated to have the greatest effect, and are now, through ingeniously constructed advertisements, published as reading notices in our first-class dailies, seeking to agitate and excite the populace to patronize these dastardly swindles.

The prizes advertised as drawn by Californians, it is safe to say, will not all amount to one-fifth of the hundreds of thousands of dollars Californians have within the last 18 months sent out of the State to perpetuate these stupendous frauds.

THE VALENTINE MINE CASE.—Judge Hunt has decided the case of A. T. Britton vs. Walter C. Childs, A. Lacey and wife, intervenors, in favor of the defendant upon all the issues. The case has been on trial for over two weeks, and was to recover \$40,000, alleged to be due the plaintiff on a contract between Lacey and Childs, whereby the latter agreed to purchase the Valentine mine, in Calaveras county, for \$50,000, of which sum \$40,000 was to be paid Lacey out of the future profits of the mine. The plaintiffs and intervenors claimed that work was improperly conducted in the mine, and was stopped too soon, and upon these issues a great amount of testimony, including the opinions of mining and milling experts, was introduced.

A LETTER from Salmon Falls, Cassia county, Idaho, says there is no truth in the rumors that men are making from \$5 to \$20 in rockers. Only those who are working on a large scale are making anything.

Washington's Birthday.

In the hurry and rush of life in this country where the communities are scattered over such a vast area, the people are apt to give little thought to the origin of many of the blessings with which they are favored in a free government. Only twice a year are they reminded of the early struggles to gain this freedom—on Fourth of July and on Washington's Birthday. On Monday next the latter anniversary occurs. Aside from the mere honoring of the memory of the "Father of his Country," which it is but just that we should do, the day is one which should cause us all to give consideration to the life and character of Washington. Pure patriotism, unflinching integrity, devotion to a noble cause, energy in overcoming obstacles, and skill in both the legislative halls and in the field, gained for him the applause of the world and the love of his countrymen.

The young of the present generation can have no nobler example of patriotism held up to them. Parents can find no purer character in history to tell their children of than this, and it should be impressed upon their minds that love of country, truth, integrity and an upright life are sure to bring their reward. On an anniversary of this kind, these and kindred facts should be commented on and considered by both old and young. We are too apt to think of the day as a mere holiday for recreation without considering sufficiently the great man, whose birthday we celebrate, and the result of whose labors we enjoy. There is latent patriotism in all men, but it is not always properly developed. These anniversaries should serve this purpose, and we should all congratulate ourselves on our good fortune in living in a nation at peace with all, and with sufficient strength and dignity to maintain its position. The early builders of the republic, who sacrificed so much for those who came after them, deserve to be gratefully enshrined in our memories. And chief among them, as the leader of our armies, and the first president of our nation, stands the figure of George Washington. The anniversary of the day when he first saw light—over 150 years ago—should always be reverentially kept by the generations who enjoy the fruits of his prowess in the field, his patriotism and his statesmanship.

Mining Accidents.

HARRY Johns, working on the 1700 level of the Crown Point mine, on the Comstock, was very seriously injured one morning last week. He was working in the breast on the second floor above the level, putting in a cap timber, when a mass of rock fell, smashing the plank upon which he was standing, precipitating him to the floor below. Both collar bones were broken, and he sustained severe strains and contusions about the hips and back, besides being otherwise severely cut and bruised about the head, shoulders and breast. It was a wonder that he was not killed outright. Con Sullivan and Joe Dettmar, two miners employed in the McNally mine, Fine Gold district, Fresno county, have been seriously injured by the ore car, which was being hauled up the incline, becoming detached and running back and crushing them.

Wm. Bree has a quartz ledge on his ranch, on the lower Colfax road, Nevada county, and when agricultural duties are not pressing upon Mr. Bree, he occupies his time in developing his quartz claim. One day last week, while Mr. Bree was at work in the mine, a mass of rock and earth fell, catching him under it and badly bruising him. The worst hurt received was about the head, as his scalp was badly cut in several places. His shoulder and neck were also bruised considerably.

AT AURORA.—As near as the present mining proposition at Aurora can be understood, the Bodie Miner says it is intended to give the mines a fair test through the Del Monte mill, and in the course of a few months, if this fair test will justify it, they will commence the work of mining on an extensive scale.

THE reason of the purchase some time ago of the Silver City, Deming and Pacific Railroad by the Atchison, Topeka and Santa Fe Company, is showing itself in the well founded rumors that the latter intends to build from Silver City to Bisbee, Tombstone, and other points in Arizona at an early date.

The State Hotel in the Yosemite.

Most readers are aware, no doubt, of the fact that the last Legislature appropriated \$40,000 to be expended by the Yosemite Valley Commissioners in the construction of a hotel for the better accommodation of the tourists who come from all parts of the world to be the guests of the State on her grand property, the Yosemite valley. It would not do to allow private capital to build a structure upon ground belonging to the State and thus obtain a monopoly of entertainment, so the desirability of a State structure, which should be under control of the Commission, became apparent. The Commission acts in the capacity of superintendent for the owner. It determines who may lease lands, and what rents shall be charged, lay out and operate trails and roads and run for a fee lines of wagons and coaches, and maintain pack and saddle-trains. It owns the houses used as hotels, leases and determines the charges to be made this public for services and entertainment, and this because under any other system the valley would be made the scene of contention among wrangling competitors for patronage, and the public would thus suffer annoyance, extortion and imposition.

The last Legislature appropriated the sum of \$40,000 for the erection of a proper hotel building in the valley. But no exclusive privileges can be granted for hotel-keeping in the valley. The Commission may grant others the privilege of entertaining and by requiring the lessee of the new hotel to properly entertain, it will insure like catering by all other hotels that it may permit to be established. The hotel is to be leased, so as to annually produce not less than three per cent upon the cost thereof.

The Commission obtained plans from a number of architects and bids from a number of contractors and finally adopted the plan shown in the engraving designed by E. L. Chandler, of Los Angeles, and let the contract for building to Carle, Croly and Abernethy of Sacramento. We are indebted to the *Record Union* of that city for the use of the engraving which we present herewith.

The hotel is of Swiss style of architecture, and, as will be seen, is appropriate to its montane surroundings. It will be named the "Stoneman House" as a compliment to the Governor, who is president of the commission. The specifications disclose the fact that it is to be first-class in every part of its construction and fitting, the timbers being very heavy, of the best material, and the fittings of the best order known; the object being to secure great durability in a climate that not infrequently is very severe. The front structure, from wall to wall, and exclusive of the porches, will be 100 feet in length, with a depth of 56 feet. The side shown in our illustration, in perspective, is an L, or wing, running back 68½ feet, by a width of 34 feet, thus giving a front of 100 feet by a depth of 124½ feet. Upon the left of the front is a parlor 23x29½ feet, with folding doors, 11x10, opening into a breakfast-room back of it, 23x24½; folding doors from this, 10x10, open into a dining-room, along the rear wall, 20x36. Next to the parlor, and opening into it by folding doors, 7½x10, is a reception room, 15x19. Back of this rise the stairways in two tiers, 5½ feet in width. Next to the reception-room, in the center of the building, and having the main entrances, is the gentlemen's parlor, 28½x32, out of which rise the stairways and open doors into the dining-room. Opening into this parlor at the rear is the office, 8x10½, and back of it the clerk's room, 10½x12. To the right of the office is the manager's room, 14½x20. Out of this parlor, on the right, at the rear, is a hall leading to the harrier shop at the extreme right, 8x10, to the rear of which, by a short hall, is the lavatory and closets, 12½x14. To the right of this parlor are four bedrooms opening into a short hall, the two first being 11.3x12 and 11.3x13.6 respectively. The

other two are of the same width, but are 14 and 15.6 respectively in depth. The balconies around this trunk of the building are 10 feet in width, but in front of the gentleman's parlor are 16 feet in width.

This wing, at its juncture with the main building, opens into the breakfast room by a six-foot passage, out of which rise the rear stairways. On the front side of the passage is the storeroom, 11.3x13.6. On the other side is the pantry, 10.9x15. The passage referred to between the pantry and storeroom extends to the cross wall beyond the kitchen, which is 23x33, to the rear of which is the laundry, 17x23.6, and a broad hall opening into the rear yard. Back of the hall is the servants' dining room, 12x16, and a flight of stairs.

The second floor is reached by the front stairways opening into a large hall running lengthwise of the building, and crossed by two other halls extending the entire width, and one of which extends entirely through the length of this wing. On the left of this floor are five rooms from 13.2x17.6 to 10x17.6 in size. In front are four rooms 11.3x15 each. Back of them two interior rooms, 11.3x13 constituting suits with two of the front rooms. To the rear are three rooms 9.1x13.6, and one 13.6x13.9. On the extreme right are five rooms 10.7x17.6 each. In the wing next the main structure is a lavatory 9x10, with closets, to the rear of which are three bath-rooms 5x10 each. Back of these

W. Chapman, Madera; Wm. B. May, San Francisco; Governor George Stoneman, Sacramento. The officers of the Board are: President, Governor George Stoneman; vice-president, I. W. Raymond; secretary and treasurer, Wm. B. May; executive committee, I. W. Raymond, chairman; Thomas P. Madden, Wm. B. May.

An Improved Pumping Plant.

The San Francisco Tool Company has for some little time been making a specialty of pumping outfits for irrigation and reclamation enterprises, and have been very successful. Engines and pumps are made in compact form and adapted for any special work. The engines used for this purpose are single acting and are made in such a form that the working parts are enclosed. For information on the merits of the San Francisco Tool Company's pumping plant, the company refers to the Mayor and Council of Sacramento. Also to J. C. Pierson, Esq., County-Surveyor Sacramento, and Pierson Reclamation district; the Rough and Ready Island, Reclamation Company district 403. Geo. C. Smith, Esq., Stockton, Messrs. Rock & Fox, San Jose, who irrigate some 300 to 400 acres of nursery grounds at Niles, Alameda county, by lifting water 57 feet with one of these remarkable pumping plants. Also to P. J. Van Lohen Sels, Esq., of California street and Walnut

Utilizing the Tule.

In the swamp lands on this coast, and along the shores and islands of the Sacramento and San Joaquin rivers, there are immense tracts covered with the tule or tule grass. This is a large club rush or sedge of the order *Cyperaceae*, and known scientifically as *Scirpus validus*. In this State it grows to a great height and its stems attain considerable diameter. These stems are very pithy, and when dried become very light and buoyant. They are not of such a loose texture as to become water-soaked, and will remain on the surface of the water for an indefinite time. The economy of this material recommends it for such purposes as life-preservers, and its abundance and extreme lightness make it preferable to cork. Mr. Constant Leduc several years ago patented the idea of forming life-preservers from snitahly-arranged bunches of this dried tule. There is no external covering of canvas or other material, such as is usually employed. The same inventor also devised a machine for making tule bunches for life-preservers.

In December, 1884, a company was incorporated here to make life-preservers out of the California tule, Charles J. Hendry being president, and manufactories have been established in this city, in Sacramento and at Stockton. The device was approved by the secretary of the treasury in February, 1884, and it was adopted by the Supervising Inspectors of Steam Vessels. Last year 5000 life-preservers, made of California tules, were sold in Boston, in addition to the large number used on the Pacific Coast. At the recent meeting of the Supervising Inspectors, a life-raft made of tules was adopted. It is expected that this will largely increase the sale of California tules, as, manufactured into life-saving apparatus, according to Mr. Bemis, 6 pounds of cork will buoy up 24 pounds' weight, while 3½ pounds of tules will buoy up from 36 to 40 pounds. Tules exist in almost unlimited quantities in California.

Another form in which the tule has been utilized is in making protecting coverings for the glass on the patent box-demijohns used on this coast. It is elastic, tough

and strong, and will last an indefinite time.

Of late, insoles of shoes have been made of the flattened stems. These are formed to fit the shoe inside, and come between the foot and the shoe, keeping the foot from any dampness in the leather sole and adding to the warmth as well. A carpet lining is also made of tule, the rushes being woven together to form a sort of soft matting, which is placed under carpets.

List of U. S. Patents for Pacific Coast Inventors.

FOR WEEK ENDING FEBRUARY 9, 1886.

- 335,737.—DIVIDED CAR AXLE—Geo. W. Redbury, S. F.
- 335,738.—MITER BOX—W. L. Boeyer, S. F.
- 335,745.—VARIABLE CRANK AND ECCENTRIC—W. H. De Valin, San Rafael, Cal.

- 335,727.—SHEET METAL PIPE MACHINE—F. F. Voigt, Walla Walla, W. T.

See list of patents for week ending Feb. 2, 1886, on page 131 of this issue.

A bid has been made by the Union Iron Works for the construction of a new steamer for the Oceanic Steamship Company's Australian line.

STONEMAN HOUSE, TO BE ERECTED BY THE STATE IN YOSEMITE VALLEY.

are four rooms, two of them 10x11½ and two 9x10. Along the front wall of the wing are rooms, one 13½x13½, two 11½x11½, one 9x13, and a linen closet 5½x12. At the rear are two rooms 8½x10, all with numerous closets.

The third floor, over the main building, is a repetition of the second, and also in the wing is a repetition of the second to its extent, it being two rooms shorter, 21½ feet, as will be seen by the illustration. The attic is laid off in four rooms upon the left side, one 13x20, and three 11½x13; along the front four rooms, 12½x13½; back of them a closet and two rooms, 12½x13½, and one 13½x16. Along the right wall are four rooms, one 13x20, two 9.9x13, and one 13x14. The attic is pierced by a central hall and two cross halls at either end. The building contains 92 rooms, exclusive of closets, lavatories, etc., as follows: Main floor, 19; second floor, 31; third floor, 27; attic, 15. The height of the different stories are: First, 14.2; second, 12.2; third, 11.2; attic, 7 feet on the sides and 10.3 in the center.

Our architectural view sufficiently discloses the exterior finish, the window schemes, the roof, balcony, hoods, etc. The structure will be placed beneath the overhanging majesty of Glacier Point. The reader must not take the mountains shown in the engraving as typical of the Yosemite heights. They are merely the conventional hills which the architect chose for a background for his perspective view of the building.

The present Commission which will superintend this new enterprise for the improvement of the valley, is composed as follows: I. W. Raymond, San Francisco; W. H. Mills, San Francisco; J. H. O'Brien, Stockton; Thomas P. Madden, San Francisco; J. M. Griffith, Los Angeles; Jonathan Mentzer, Coulterville; E.

Grove. At Walnut Grove Mr. Van Lohen Sels has two 15 inch pumps coupled together, driven by a 60-horse power engine, with a combined capacity of 20,000 gallons a minute.

The San Francisco Tool Company has now under contract and is constructing for Mr. Van Lohen Sels a 30-inch pump, connected direct with a compound condensing engine of 150 horse-power, which will lift 40,000 gallons of water a minute, or the two plants 60,000 gallons, or 86,400,000 gallons in 24 hours. In other words, given a rainfall of four-sevenths of an inch over an area of 20 square miles, the Van Lohen Sels pumping plant could, by 24 hours' continuous pumping, remove it all. The 150 horse-power engine will be run by a battery of three boilers; two 60-inch by 16 feet, and one 48-inch by 16 feet. These boilers will be so connected that any one or two of the whole can be used as required.

The *Central Nevada* says the reported sale of the Pittsburgh mines at Lewis to Haggin & Tevis, San Francisco, for \$90,000 is a mistake. On the contrary, the property has been withdrawn from the market until the pending litigation can be settled by the courts.

The Liberty Hall Consolidated Mine and Water Company has petitioned the Circuit Court to suspend the temporary injunctions, on the ground that the slickens are being impounded.

Owing to the recent troubles at Seattle, the coal mines of the Oregon Improvement Company have been shut down, and as a result, the three colliers of the company will remain idle for a time.

MANY miners from New Mexico and Arizona are on their way to the Honduras gold fields.

PRACTICAL HYDRAULICS.*

NUMBER 18. COPYRIGHTED.

PRINCIPLES OF HYDRAULICS.

[Written for MINING AND SCIENTIFIC PRESS by P. M. RANDALL.]

CURVED BENDS.

Let h = additional head required to overcome the resistances of curvature.

b = angle of curvature of the pipe.

R = radius of curvature of the bend.

r = radius of the pipe.

z = coefficient of resistance.

$$h = \frac{z b^2 v^2}{180^\circ} = \frac{z b v^2}{n(2g)} \quad (177)$$

$$z = 0.131 + 1.847 \left\{ \frac{r}{R} \right\}^2 \quad (178)$$

Eq. (178), from which Table 20 is computed, is for pipes with circular cross sections.

TABLE 20.

Coefficients of Resistance of Curvature with Circular Transverse Sections.

$\frac{r}{R}$	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8	0.9	1.0
z131	.138	.158	.206	.294	.440	.661	.977	1.408	1.978

Rule 41.—The additional head required to overcome the resistance of curvature, of a bent pipe, is equal to

the product of the head, $h = \left\{ \frac{v^2}{2g} \right\}$, generating the ve-

locity, the ratio $\left\{ \frac{b^\circ}{180^\circ} = \frac{b}{n} \right\}$ of 180° or n , to the an-

gle of deflection or length of bend, and the coefficient of resistance, corresponding to the ratio of the radius of curvature to the radius of the pipe.

Ex. 83.—The velocity of water in a pipe 2 inches diameter, is 16 feet per second; what additional head will be requisite to overcome the resistances of a bend in the pipe, whose radius of curvature is 2 inches, and angle of deflection 90° ?

Cal.—Head generating velocity, equal to the square of the velocity, divided by 64.4 , as $h_f = 16 \times 16 \div 64.4 = 3.975$.

$\frac{r}{R} = \frac{1}{2} = .5$, ratio of given radii; $b = \frac{90^\circ}{180^\circ} = \frac{1}{2}$, ratio of 180° , to given angle of deflection.

By Table 20, the coefficient corresponding to .5, the ratio of radii is .294.

Then by Rule 41, $3.975 \times \frac{1}{2} \times .294 = .584$ feet.—Ans.

$$z_u = 0.124 + 3.104 \left\{ \frac{r}{R} \right\}^2 \quad (179)$$

In Eq. (179), from which Table 21 is computed, r represents half the width of a rectangular pipe; and R , the radius of curvature of the axis.

TABLE 21.

Coefficients of Resistance of Curvature in Pipes with Rectangular Transverse Sections.

$\frac{r}{R}$	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8	0.9	1.0
z_u	1.124	.135	.180	.250	.398	.643	1.015	1.546	2.271	3.228

Remark.—Rule 41 applies to finding the additional head required to overcome the resistance of curvature of a bent pipe, whose cross section is rectangular, by employing Table 21 instead of Table 20.

Total Head.—Let in general:

$$h_u = n z_u \left\{ \frac{v^2}{2g} \right\} \quad (180)$$

represent the additional head requisite to overcome the resistances of n , given bends—angular or curved—in a pipe, the form of whose cross section is given—circular or rectangular.

Combining (180) and (122), observing that $c = .505$ of (127), $\frac{p}{a} = \frac{1}{r} = \frac{4}{d}$, and $2g = 64.4$,

$$h + h_u = \left\{ 1.505 + \frac{4cl}{d} + n z_u \right\} \frac{v^2}{64.4} \quad (181)$$

Ex. 84. A pipe 1 foot diameter, 500 feet long, has five quadrant, or right angled bends: the radius of curvature of each bend is 1 foot; the velocity of water through the pipe is 8.025 feet per second. What is the total head?

Cal. By Table 16, the coefficient corresponding to a velocity of 8 feet per second in a pipe whose diameter is $d = 1$ ft., is $c_f = .0052$.

Square of velocity divided by 64.4 ; 8.025×8.025

This series of articles will shortly be published in book form by Dewey & Co., Publishers of the MINING AND SCIENTIFIC PRESS, 252 Market St., S. F. Subscriptions for the book will be filled in the order in which they are received.

$$\div 64.4 = 1. \text{ In the present case } n = 5 \times \frac{6^\circ}{180^\circ} = 5 \times \frac{90^\circ}{180^\circ}$$

$$= 2.5. \text{ Ratio of the given radii, } \frac{r}{R} = \frac{.5}{1} = .5.$$

$$\text{By Table 20, when } \frac{r}{R} = .5, z = \frac{.2}{.5} = .294.$$

Substituting in (181) the values of $c_f = .0052$, $d = 1$ foot, $l = 500$ feet, $n = 2.5$, and $z_u = .294$.

$$h + h_u = (1.505 + 4 \times .0052 \times 500 + 2.5 \times .294) = 12.64 \text{ feet.—Ans.}$$

FLOW OF WATER THROUGH NOZZLES.

The resistance to the flow of water in conically convergent tubes, estimated for the smaller orifice, is less than the resistance in a cylindrical tube with equal orifice. Thus, Table 13 shows that the coefficient of velocity from a tube converging with an angle $3^\circ 10'$ is .894; and that the coefficient for a cylindrical tube of equal diameter is .829. Let t represent this ratio:

$$t = \frac{.894}{.829} \quad (182)$$

Let v = the experimental velocity of water in a cylindrical pipe, the ratio of whose diameter to length is as 1:10; v_1 = the theoretical velocity in same pipe; c_f = coefficient of resistance, varying from .006 to .004; c_u = mean coefficient of velocity with respect to the smaller orifice of the nozzles,

$$c_u = t \left\{ \frac{v}{v_1} \right\} \quad (183)$$

Substituting the values of $c_f = .004$, $d = 1$, and $l = 10$ in (128),

$$v = (2gh)^{\frac{1}{2}} \left\{ \frac{1.505 + 1.004 \times 10 \times 4}{1.505 + 1.004 \times 10 \times 4} \right\}^{\frac{1}{2}} = .775(2gh)^{\frac{1}{2}} \quad (184)$$

$$v_1 = (2gh)^{\frac{1}{2}}, \text{ as per Eq. (8).} \quad (185)$$

Substituting the values of v , v_1 , and t , in (183), $c_u = .836$, nozzle coefficient (186).

Ex. 85.—A nozzle being 6 inches diameter at its discharge end, 5 feet long, will discharge under a head of 150 feet how many cubic feet of water per second?

Cal.—In "6-inch" diameter column, opposite 150 feet in "head" column, Table 22, the quantity sought is found = 16.13 cubic feet.

RELATIVE CARRYING CAPACITIES OF CLEAN, FOUL AND VERY FOUL WATER PIPES.

In the preceding discussion with respect to the carrying capacities of water pipes, they have been considered clean.

Assuming the coefficient of resistance for a clean pipe, .00644; for a rough or foul pipe, .0082; and for a very foul pipe, .012, then will the relative volumes of flow be:

For clean pipes, 1.0000;

For foul pipes, .8863;

For very foul pipes, .7325.

Rule 42.—In case a water pipe is rough and foul,

multiply the flow for a clean pipe in Table 17 (with same diameter, length and head), by 9, 8, 7, etc., according to the degree of foulness, as judgment shall dictate.

Ex. 89.—A long pipe, 6 inches diameter, has a fall of 18.48 feet per mile. What will be the flow in cubic feet per second, if its coefficient of discharge with respect to a clean pipe be .8?

Cal.—In Table 17, find opposite the given fall 18.48 feet, in discharge column, for a 6-inch pipe, .395 cubic feet. This is for a clean pipe.

Then by Rule 42, $.395 \times .8 = .316$ cubic feet.—Ans.

Pressure Ordinates.—A mean pressure ordinate is the vertical distance between the axis of the pipe and the hydraulic gradient. Thus in Fig. 19, CE is the hydraulic gradient, and $(ab+r)$, $(cd+r)$, or $(ef+r)$, is a mean pressure ordinate. If the axis of the pipe be depressed below the base, as represented in Fig. 19, by the dotted line, D, a, c, e , $E-ab$, cd or ef , will be the mean pressure ordinate for the given point, a , c or e . To find the value of the ordinate in pounds pressure:

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING FEBRUARY 2, 1886

- 335,500.—VEGETABLE CUTTER—De F. Bullock, Summit, W. T.
 335,219.—ORE CONCENTRATOR—W. A. Frank, Pinal, A. T.
 335,278.—PAINTER'S CLIMBING DEVICE—E. H. Gadsby, S. F.
 335,279.—SEWER TRAP COVER—C. W. Garland, Oakland, Cal.
 R 10,681.—TRAMWAY FOR CURVES, ETC.—A. J. Halliday, S. F.
 335,351.—FRUIT DRIER, A. J. Hatch, S. F.
 335,288.—SAFETY RAIL AND REIN GRIP FOR VEHICLES—F. W. Kroeber, St. Helena, Cal.
 335,459.—ROCK DRILL—E. Moreau, S. F.
 335,470.—ROCK DRILL—E. Moreau, S. F.
 335,309.—CUTTER HEAD—W. G. Kendall, Portland, Or.
 335,330.—FRUIT JAR—H. Wilcox, Los Gatos, Cal.
 335,495.—INSULATING MATERIAL—J. B. Williams, S. F.
 335,498.—ELEVATOR—J. H. Wisheart, Chico, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT JAR.—Harvey Wilcox, Los Gatos, Santa Clara Co. No. 335,330. Dated Feb. 2, 1886. This is a new fastening for the covers of fruit jars. The usual nail or clamp is so formed that there is a groove or guide in its center. Through this groove, between the clamp and cover, passes a piece of spring-wire of an elongated U-shape. It is convexed in the direction of its length. This is claimed to be better than wedges, as any shrinkage is overcome by the spring keeping the cover down tight. The cover of the jar is perfectly smooth on top, the guide for the spring being in the ball or clamp. The use of the spring affords a constantly adjustable pressure, which provides against any loosening of the cover by the shrinkage alluded to, and for any that takes place, the spring has simply to continue its pressure to keep the joint tight.

FRUIT DRIER.—Andrew J. Hatch, S. F. No. 335,351. Dated Feb. 2, 1886. The invention relates to that class of fruit driers in which a horizontal longitudinal drying chamber is employed, and in which the trays containing the fruit are inserted upon rolling trucks or cars, hot air being supplied to the drying chambers from a suitable heating chamber beneath it, and caused to pass through by means of a suction fan-wheel. The invention consists in certain improvements which may be briefly enumerated as follows: Means for providing a reversible draft of hot air horizontally through the drying chamber—that is to say, changing the direction of said draft from one end of the drying chamber to the other, as may be desired; a peculiar distributor placed within the drying chambers above the hot air apertures communicating with the heating chamber; a device used in connection with the suction fan for preventing the rotary motion of the air, and a means for inserting the ear or truck with its trays without unduly exposing the drying chamber to the influence of the outer air.

FUEL OF THE FUTURE.—The house of the near future will have no fire-place, steam pipes, chimneys or flues. Wood, coal oil and other forms of fuel are about to disappear altogether in places having factories. Gas has become so cheap that already it is supplanting fuels. A single jet fairly heats a small room in cold weather. A New York artist has produced a simple design for heating entirely of gas at a mere nominal expense. It is a well known fact that gas throws off no smoke, soot or dirt. The artist filled a brazier with chunks of colored glass and placed several jets beneath. The glass soon became heated sufficiently to thoroughly warm a room 10x30 feet in size. This design does away with the necessity for chimneys, since there is no smoke, the ventilation may be had at the window. The heat may be raised or lowered by simply regulating the flow of gas. The colored glass gives all the appearance of fire; there are black pieces to represent coal, red chunks for flame, yellowish white glass for white heat, blue glass for blue flame, and hues for all the remaining colors of spectrum. Invention already is displacing the present fuels for furnaces and cooking ranges, and glass doing away with delay and such disagreeable objects as ashes, kindling wood, etc.

It is said that shingle may be made fire proof by setting the butts into a trough of water, in which a half bushel each of lime and salt, and six pounds of potash have been dissolved,

USEFUL INFORMATION.

Removal of Paint and Varnish.

Where it is requisite to remove painting entirely from its ground, it is usual to resort to mechanical scraping, etc., or to the very dangerous operation of setting fire to the painted surface immediately after washing it over with oil of turpentine, called turps, an operation that may be safely and more easily accomplished by laying on a thick wash or plaster of fresh-slacked quicklime, mixed with soda, which may be washed off with water the following day, carrying with it the paint, grease, and other foulness, so that when clear and dry, the painting may be renewed as on fresh work. Clear colling is sometimes resorted to over old painting, for the purpose of repainting, in which case the surface exposed to the sun's rays or alterations of temperature is liable to become blistered and scale off. Varnish may be removed by friction. If it be a soft varnish, such as that of mastic, the simple rubbing of the finger-ends, with or without water, may be found sufficient; a portion of the resin attaches itself to the fingers, and by continued rubbing removes the varnish. If it be a hard varnish, such as that of copal, which is to be removed, friction with sand or river sand, the particles of which have a roundness that prevents their scratching, will accomplish the purpose. The solvents commonly employed for this purpose are the several alkalies, alcohol and essential oils, used simply or combined. Of the alkalies, the volatile in its mildest state, or carbonate of ammonia, is the only one which can be safely used in removing dirt, oil and varnish from a picture, which it does powerfully; it must therefore be much diluted with water, according to the power required, and employed with judgment and caution, stopping its action on the painting at the proper time by the use of pure water and a sponge. A thick coat of wet fuller's earth may be employed with safety, and, after remaining on the paint a sufficient time to soften, the extraneous surface may be removed by washing, leaving the picture clean. An architect of the author's acquaintance has succeeded in a similar way in restoring both paintings and gilding to their original beauty by coating them with wet clay. Ox-gall is even more efficacious than soap.

In filling cracks and replacing portions of the ground, putty formed of white lead, whiting, varnish and drying oil, tinted somewhat lighter than the local colors require, may be employed, and in some cases, also, plaster of Paris. In restoring colors accidentally removed, it should be done with a vehicle of simple varnish, because of the change of tint which takes place after drying in oil.

THE WHEEL PARADOX.—The question is often asked: "Does the top of the wheel go faster than the bottom, or just as fast?" A cotemporary answers this question as follows: "When a wheel is put in motion every part of it starts at the same moment, and when its motion is stopped, every part stops at the same moment, and the speed is uniform at every point. This is true whether the wheel is simply revolving on its axis or resting on the ground, though in the latter instance it has also a forward movement besides the circular movement around its axis. The forward movement is also exactly uniform in every part. Some newspaper writer has attempted to prove a paradox, arguing that the bottom of the wheel goes backward or remains stationary for a moment while the top is going forward. In going forward, the wheel, in one revolution, traverses a distance equal to its circumference. Every point on the wheel makes exactly the same distance, starting and stopping at the same distance with each other, which would not be the case if one part moved faster than the other—a thing impossible. The line described by any point in the circumference of a wheel moving on a plane, from the time it leaves the ground until it touches it again—in other words in making one complete revolution—forms a cycloid, and in making the next revolution, every point on the circumference, whether at the top or bottom, continues forward at the same rate, starting immediately from where the last revolution left it. For a complete explanation of the principle, the querist is referred to the discussion of the cycloid in Cherré's "Calculus," or any treatise on the cycloid."

A SINGULAR MILL FIRE.—Mr. C. J. H. Woodbury relates the following curious circumstances to illustrate the singular and unexpected origin of fires: One evening a June bug flew into the carding room of a cotton mill, which was in operation day and night. The leg of the insect caught a piece of roving and it flew into a gas light; the roving caught fire, and, dropping into a can of cotton sliver, ignited that and started a blaze, which would have been serious had it not been for the presence of mind of an operative, who smothered the fire by covering the top of the drawing can with his coat.

PREFERENCES IN BOILERS.—When we are questioned as to our preference in the boiler line, says a cotemporary, we always require to know how, where and for what the boiler is to be used. A boiler which will furnish steam with the least expense for fuel and repairs in a New England cotton mill might be the most inconvenient and expensive that could be used

in a portion of the country less favored as to water. A boiler which would furnish admirably the low pressure and quantity of steam required for heating purposes, might be entirely at a loss under the high pressure, and the more intense combustion requisite as a source of power. The locomotive boiler is particularly adapted to its special work. It gives us the maximum power in the smallest space and with the lightest weight, yet it would hardly be the most economical or desirable boiler, all things considered, for most stationary plants. When a man talks one boiler straight through thick and thin, for all purposes, and in all conditions, it is safe to conclude that he has an interest in that boiler, or that he does not know what he is talking about.

BUT, IT IS NOT BUTTER.—Certain parties have contrived an ingenious process for getting the caseine out of milk, along with the fatty particles, and so producing a white mass that is erroneously termed butter. Of course, it isn't butter, any more than a compound of a small portion of real butter and a large portion of "hull fat" would be. The caseine has no place in genuine butter, but they get four pounds of the stuff out of a gallon of milk, and can produce it at five cents a pound; so no doubt there will be people who will betray their palates with it. The exploiters of the process are trying to sell State rights for manufacture, and have actually found a person to buy the right for England. The cook expert has figured it out that their so-called secret consists in allowing milk to stand in a warm temperature until it is sour and thick, when it is put in a churn. A quantity of melted old butter is added, and after it is churned for some time rennet is added, which solidifies the curd with the fat of the milk. Of course this hogus butter will not keep sweet any length of time.

METHOD IN WORK.—With most people, says a sensible writer, the want of a well defined system or method is one of the chief causes of their getting behind hand with their work. A systematic method of working combined with industry, will complete a vast amount of work in a day and finish it with ease; but without system and application, the worker may be in a continual rush, and yet accomplish little.

THE WEeping WILLOW seems to have had a romantic history. The first scion, it was said, was sent from Smyrna in a box of figs to Alexander Pope. General Clinton brought a shoot from Pope's tree to America in the time of the Revolution, which, passing into the hands of John Parke Curtis, was planted on his estate in Virginia, thus becoming the progenitor of the weeping willow in America.—*The Garden.*

THE SIGNS + and —, it is said, were first used by Christopher Rudolph about 1524. The sign = was first employed by Robert Recorde in 1557, because, said he, "noe 2 thynges can be moare equalle."

GOOD HEALTH.

Checked Perspiration

Is the fruitful cause of sickness, disease and death of multitudes every year. If a tea-kettle of water is boiling on the fire, steam is seen issuing from the spout, carrying the extra heat with it, but if the lid be fastened down and the spout be plugged, a destructive explosion follows in a very short time.

Heat is constantly generated within the human body, by the chemical disorganization, the combustion of the food we eat. There are seven millions of tubes or pores on the surface of the body, which in health are constantly open, conveying from the system by what is called insensible perspiration this internal heat, which having answered its purpose, is passed off like the jets of steam which are thrown from the escape-pipe, in puffs, of any ordinary steam engine; but this insensible perspiration carries with it, in a dissolved form, very much of the waste matter of the system, to the extent of a pound or two or more every twenty-four hours. It must be apparent, then, that if the pores of the skin are closed, if the multitudes of valves, which are placed over the whole surface of the human body are shut down, two things take place. First, the internal heat is prevented from passing off, it accumulates every moment, the person expresses himself as burning up, and large draughts of water are swallowed to quench the internal fire—this we call "fever." When the warm steam is constantly escaping from the body in health, it keeps the skin moist, and there is a soft, pleasant feel and warmth about it. But when the pores are closed, the skin feels harsh, and hot and dry.

But another result follows the closing of the pores of the skin, and more immediately dangerous; a main outlet for the waste of the body is closed, it remingles with the blood, which in a few hours becomes impure, and begins to generate disease in every fiber of the system—this whole machinery of the man becomes at once disordered, and he expresses himself as "feeling miserable." The terrible effects of checked perspiration of a dog, who sweats only by his tongue, is evinced by his becoming "mad." The water runs in streams from a dog's mouth in summer if exercising

freely. If it ceases to run, that is *hydrophobia*.

It has been asserted by a French physician that if a person suffering under *hydrophobia* can be only made to perspire freely, no is cured at once. It is familiar to the commonest observer, that in all ordinary forms of disease, the patient begins to get better the moment he begins to perspire; simply because the internal heat is passing off, and there is an outlet for the waste of the system. Thus it is, that one of the most important means for curing all sickness, is bodily cleanliness, which is simply removing from the mouths of these little pores, that gum, and dust, and oil which clog them up. Thus it is, also, that personal cleanliness is one of the main elements of health; thus it is that filth and disease habitate together the world over.

There are two kinds of perspiration, *sensible* and *insensible*. When we see drops of water on the surface of the body as the result of exercise, or subsidence of fever, that is *sensible perspiration*, perspiration recognized by the sense of sight. But when perspiration is so gentle that it cannot be detected in the shape of water drops, when no moisture can be felt, when it is known to us only by a certain softness of the skin, that is *insensible perspiration*, and is so gentle that it may be checked to a very considerable extent without special injury. But to use popular language which cannot be mistaken, when a man is sweating freely, and it is suddenly checked, and the sweat is not brought out again in a very few moments, sudden and painful sickness is a very certain result.

What then checks perspiration? A draft of air while we are at rest, after exercise, or getting the clothing wet and remaining at rest while it is so. Getting out of a warm bed and going to an open door or window, has been the death of multitudes.

A lady heard the cry of fire at midnight: it was bitter cold; it was so near the flames illuminated her chamber. She left the bed, hoisted the window, the cold wind chilled her in a moment. From that moment until her death, a quarter of a century later, she never saw a well day.

A young lady went to a window in her night-dresses to look at something in the street, leaning her unprotected arms on the stone window-sill, which was damp and cold. She became an invalid for life. The great practical lesson which we wish to impress on the mind of the reader is this, When you are perspiring freely, *keep in motion*, until you get to a good fire, or to some place where you are perfectly sheltered from any draft of air whatever.—*Hall's Journal of Health.*

HIP POCKETS.—The general practitioner is frequently asked by anxious parents: "What shall I do for my boy; he is getting so awfully stoop-shouldered that I am afraid he will get consumption; I will have to get him a brace. What kind would you recommend?" It requires no extended argument to prove the importance of a well-expanded chest. Apart from the incalculable benefits to health, an erect carriage and graceful movements attract the attention of the most humble. It causes them to correct as far as they are able, in their children any tendency to awkward, stooping or ungainly positions. Apart from the cost and inconveniences of expensive instruments, but few meet the requirements. In many cases better results may be obtained by attending to a few simple details, within the reach of every one, in the ordinary clothing. The boy's pockets are to him a very important part of his dress, and the natural tendency is to keep his hands in them. When not actively engaged, there they are usually found, and if the pockets are properly placed, they will inadvertently cause him to throw back the shoulders and more or less expand the chest. For instance, the jacket or overcoat should have what is called breastpockets, the opening should be high and as far back as possible, parallel with and in the line of the body, instead of low down and transverse, as usually found in the ordinary jacket or overcoat. The pants should have what are called "hip pockets," and no others. It will then be apparent that, whilst the hands are in the pockets a better, if not a perfect, position will be assumed and the boy spared the many admonitions to "Keep your hands out of your pockets," and the accompanying box on the ear.

HYPODERMIC MEDICATION.—In an editorial in the September number of the *St. Louis Medical and Surgical Journal*, the editor wisely remarks that with but few exceptions medicines produce their effect by absorption, regardless of the locality of administration. Experimentation long since demonstrated that remedies given subcutaneously and in smaller doses act much more rapidly than when introduced by the stomach, and a knowledge of this fact enables the practitioner to deal successfully with many conditions otherwise uncontrollable. The advantages afforded through this instrumentality are not as freely grasped as would naturally be supposed, physicians generally limiting such medication to the injection of morphia, mainly for the relief of neuralgia. This literature of the subject has been insufficiently studied, and the average practitioner has consequently remained satisfied with the stereotyped methods of medicating. Perhaps, too, the disinclination of the physician to inflict even the minimum of pain incident to the introduction of the needle, coupled with the aversion of most patients to any procedure, even remotely allied to surgery, have operated as deterrents to the general adoption of hypodermic medication.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SOUTH SPRING HILL.—*Amador Ledger*, Feb. 6: This mine continues to move along prosperously. The air compressor and drilling machinery are on the ground, and in process of being put in position. It is the intention to commence sinking another shaft almost immediately. This shaft will be located southeast of the present shaft, and nearly midway between the old shaft and the mill. It has been decided to make it vertical, the present shaft being on an incline. The mill is crushing about 40 tons of ore per day, or an average of two tons to the stamp. This is a much lower average than at the Zeile or Keystone, the former mill of 40 stamps reducing over 130 tons per day, more than three tons to the stamp, and the latter averaging about 2½ tons per stamp. At the South Spring Hill, however, the ore is of finer grade, and requires to be crushed finer, a much finer grade of screens being used. Since the 20 stamps have been in motion, the monthly output of gold has been \$75,000, an average of over \$12 per ton. The trial between the Frue and Triumph concentrators was brought to a close the first of this month. The result of the test we are not in position to announce definitely, although it is admitted that both are first-class machines, and furthermore, that on whichever side the advantage rests, it is not of such a decisive character as to definitely settle the question of superiority between these rivals.

MISCELLANEOUS.—The big tunnel at Middle Bar is in a distance of 3200 feet. A slight turn to the eastward has been given lately in the direction of the work, as it is believed that the ledge will be reached quicker by that course. We understand that capitalists are negotiating for the purchase of the whole or a large interest in the Doyle quartz claim, in Hunt's gulch. There is every prospect of this proving a good paying property. The daily cleanup of the plates at the Moore mill has been highly satisfactory, leaving no room for doubt that the rock will pay handsomely. The water in the Kennedy mine has been reduced below the 600 level. The work of draining the mine progresses much more rapidly than was anticipated.

Calaveras.

MURPHYS.—*Cor. Calaveras Citizen*, Feb. 13: Perhaps there is no place in this vicinity that so attracts the visitor, as the Oro Plata mine and works. The mine is located on a prominent elevation several hundred feet higher than the townsite. The works are extensive, covering a large area of ground, complete in its various departments in working its ores, and for simplicity of machinery, thorough practicability in arrangement of everything in and around the mill and mine challenges the admiration of the visitor. The mill with its stamps and pulverizers started up on the first of January, after extensive preparations had been made to facilitate work in mine and mill, and was in successful operation until some days ago, when the management were compelled to succumb to the inclemency of the weather. The incessant rain of the days and weeks previous started the banks of the excavation which in falling covered the mouth of the chute, and from the great weight crushed the timbers and damaging the underground works. The aperture thus closed, filled with water, endangering the lives of the miners, should they undertake to clear the tunnel. Supt. Morse doubtless with the humane desire to not risk life, stopped worked, went below and purchased a centrifugal pump and in less than ten days had it placed in position and the water pumped out of the excavation and men set to work again in safety. A donkey engine placed on the brink of the excavation furnished the power, and in less than 24 hours the water was pumped from the great pit. The pump worked to a charm and claimed the admiration of all who witnessed its splendid working, and all are enthusiastic in its praise. The pump will always be in readiness hereafter on occasions of extreme bad weather. The mill will in a short time be in successful operation, and will give a good account of itself. More plates are being added as the extreme fine gold necessitated it. There can be no doubt as to the final success of the company's working the ore on a paying basis, and the mine in the near future will be numbered among the best in the State. The Johnny Saltaire mine on Indian creek bids fair to become one of the best properties in this vicinity. Supt. Adams of this place who bonded the mine is vigorously prosecuting the work, and a depth of nearly 70 feet has been attained. The lode at this depth keeps up its high reputation at commencement, and would delight the eye of an expert. It is fully five feet wide with gold plainly visible through it.

WEST POINT.—*Calaveras Chronicle*, Feb. 13: This district is situated in the northern portion of Calaveras, and borders on Amador county, and is isolated to a degree that almost skirts on obscurity. Its area does not exceed 25 square miles in extent. There have been several hundred mines found here, and they have yielded from a few hundreds to several hundred thousands worth of ore respectively. The deepest mine worked has not exceeded 900 in depth. There are about five good mines in the whole district, which by good management can be made to pay dividends and the rest are nonentities, and capitalists have been working all around those five for the last twenty years, with the exception of one, whose development has exceeded all anticipation, and that is, namely, the Lockwood, the other four will result the same when worked. The prices asked for them have not fitted the coffers of investors here, hence their being neglected, causing seams to be prospected to the utter condemnation of those valuable ledges. This camp has not had a fair test yet, and awaits the helping hand of a powerful company to develop the few principal mines in this district in a proper shape.

Fresno.

FRESNO FLATS.—*Cor. Expositor*, Feb. 10: Miners have gone to work at the Texan Flat mine. The owners will put up new hoisting works and other machinery on the mine as soon as the roads are in good condition and large teams can travel. I hear that from four buckets of dirt taken out of the Surprise mine \$9,000 were obtained. This mine was lately bought from the McDonald brothers by

Thomas Ewing. It is one of the best mines in these parts among those that have been opened up. The owners of the Lucky Bill mine—Messrs. Baker, Oxendine, Crane and Westfall—are running a tunnel to tap the bottom of their shaft, which is about one hundred feet deep. They have gone in about one hundred and twenty-five feet, and have about twenty-five feet more to run. Every indication shows that this mine on a true fissure lode. They have taken out, with very little work, \$6,000. The rock was milled at the Enterprise mill, and worked \$55 per ton. After the tunnel is in they expect to run a winze and cut the vein. I can't say how far down they expect to go. I know they would not sell the mine to-day for \$50,000. Messrs. Lyon & Day have bonded the Confidence mine for one year. They are prospecting the same with the intention of putting up works. They speak well of what they have seen so far. This is the mine that thousands of dollars were taken out of by Dolds and others some few years ago. There is a ten-stamp mill on the property. Messrs. Lang & Co. are quietly going on with work at their mine on Deadwood. They make a shipment of bullion every few weeks by Wells, Fargo & Co. They have a good property, and have one of the best mills of the kind—five stamps—in the county. Mr. Lang deserves great credit for his enterprise. He is a man who will make ends meet wherever he is.

Inyo.

SWANSEA FURNACE.—*Independent*, Feb. 10: The furnace at Swansea was temporarily shut down at the end of last week, the supply of coal and coke having been exhausted. Up to the time of the stoppage the furnace had been running twenty days. The amount of bullion turned out in that time was 135 tons, \$240 a ton; total value, \$32,400. It is expected that about 60 tons more bullion will be produced when work is resumed and the whole run finished; this will bring the total value of the run up to \$46,800. A good proportion of this large sum will be got from slag, the refuse of former workings at Cerro Gordon and Swansea. This shows how much improvement has been made on former methods of smelting. It also shows how much the mining business of the district may be extended; ores formerly thrown away as being too low grade to pay for working can now be worked at a fair profit; and as there is a very large quantity of such ores in the district the business is very likely to grow to large proportions.

CHRYSOPOLIS ORE.—Last Wednesday Mr. W. A. Bolinger made a shipment of gold bullion worth \$600 taken from a sample lot of fifty tons of ore from the Eureka mine at Chrysopolis. Mr. Bolinger thinks that from three to four hundred dollars worth of gold yet remained to be cleaned up from the battery when the shipment was made. The ore was crushed at the Maxim mill. The vein from which this ore was taken is six to eight feet wide, and the sample would scarcely be up to the average value of the whole ledge. Mr. Bolinger says that with a little more work on the mine he could open up ground enough to supply ore for a twenty stamp mill.

KEYNOT.—The old Mexican who discovered the Keynot mine years ago recently returned to the mine and went to work. In a day or two he struck a small vein of ore, not over eight inches wide, but it goes over two hundred dollars per ton. The old man is not able to work more than three or four hours a day, but even at that he can make good wages. Ten other miners are working in the mine on tribute. All are doing well.

CLOSED.—*Register*, Feb. 11: Thursday last, Gorman & McKenzie, the lessees, closed down the Hawley furnace for the usual repairs, and to get a sufficient supply of ore and coal ahead. They will start up again about Monday next. Quite a number of men and teams are constantly employed. Messrs. G. & M. have reduced the price of reducing lead ores to \$17 per ton.

SNOW CANYON.—An item in last week's issue stated that rich gold ore had been struck in one of Eddy's mines in Slate Range district. This was a mistake; the strike was made in Snow Canyon, and promises to be of importance. Mr. Eddy is now running the mill with quite satisfactory results.

YGNACIO MINE.—An iron ore car was sent down from Independence to the Ygnacio mine, at Cerro Gordo, yesterday. The present owners of the mine appear to be intent on working the mine extensively; their operations are being extended.

Monterey.

THE MONTEREY COAL MINE.—*Monterey Argus*. As soon as a patent is received for the Sur Chiquito Rancho, it is the intention of the owners to commence operations at this mine. As there will be plenty of capital to back the enterprise this time, there is no doubt but that the mine will be successfully worked. The product will be shipped to San Francisco in the shape of coke, works for burning it to be erected at the cove landing at Point Lobos.

Nevada.

AT THE CROWN POINT MINE.—*Grass Valley Union*, Feb. 30: The rich quartz taken out of the Crown Point mine a few days ago excites the admiration of all who have seen it, as some of the streaks of pure gold are nearly a half-inch in thickness. The rock was taken out of the stope in the southeast drift of the 880-foot level, where the ledge and ledge matter is from six to seven feet between walls, and not far from the end of the drift, which is in 275 feet from the shaft. The general character of the rock being taken out is excellent, averaging about \$25 per ton. No waste is now coming out of the mine, the vein being so wide that there is no occasion for the removal of waste material. Six men underground and a carman send up enough quartz to keep the ten-stamp mill constantly going. The mill is run by free water taken from Wolf creek, but is soon to be supplied by 775 inches of water through the new Idaho ditch, which will give 45 feet more fall than is obtained now, and will furnish more power for opening other levels that are contemplated. The water-wheel that drives the mill is 34 feet in diameter, while a six-foot Pelton is used for hoisting and pumping purposes. The work of reopening the 300 level, which is 120 feet below the level that is now furnishing quartz for the mill, is now progressing. No work has been done on this level since 1871 (which was by the former owners) and it is found that the shaft contains much mud and slime, which has to be removed. This work will require fully three weeks more, when the work of exploitation will be commenced. There is every

reason to suppose, from the good developments which have been made on the 180 level that the 300 level will prove equally as good; and the continuance of the vein at its present large size will give an extent of backs that will require more extensive milling facilities, which will be obtained by putting in the mill ten additional stamps. Everything points to the Crown Point becoming a great mine.

THE TEXAS MINE.—*Transcript*, Feb. 13: Last Thursday afternoon the Texas Company made what is now considered an important strike in their tunnel. For a long time they have been running a tunnel to tap some of their ledges, and on the day above mentioned a ledge of fine-looking quartz was found, which prospects better than anything heretofore found in that section of the Willow Valley district. The size of the ledge is not known, but it is believed to be three or four feet. Rock containing free gold is seen in the ledge, and it is believed now that they are about uncovering a pay chute. If this proves true, some half dozen other claims will be started up immediately, as by this strike the pay chute of that section will be easily traced. There is more quartz in that section near the surface than in any other part of the district, but the trouble has been that the assays were always very low. Years ago it was predicted that if ever a pay chute was discovered in the Texas, or adjoining ground, and no one doubts its existence, Willow Valley would be the liveliest mining district in the county. It will take several days to ascertain the importance of the strike at the Texas. The Jones boys have struck a fine-looking 18-inch quartz ledge in the Willow Valley district. They have already had one crushing which paid them beyond their expectations, and have now on their dumps about 25 tons.

IMPROVEMENTS AT THE EMPIRE MINE.—*Grass Valley Union*, Feb. 12: Very extensive improvements are being made to the Empire mill on Ophir Hill. Another large mill building has been erected alongside of the present 20-stamp mill, in which there will be room for 40 stamps, although it is contemplated to put in but 20 at this time. The new addition will be provided with rock-breakers, grizzlies, ore bins and self-feeders, to provide against the least possible handling of the quartz after being dumped upon the upper platform. Another large building has been erected for pan rooms, concentrators, etc., which will make the establishment the largest in the district, and looks to the providing of mill power to work the mine on an extensive scale, which is in contemplation, as there are large bodies of low-grade ore in the mine that it is proposed to extract when water power is introduced to supplant the use of steam, as the cost of reduction will then be greatly reduced. The new improvements are all being made with a view to the introduction of water power, and the work of providing the necessary canals, reservoir and pipe line has already been commenced, and will be pushed with all possible speed—the intention being to have the water power available to run the works by the first of May.

Placer.

AT WORK.—*Placer Co. Republican*, Feb. 13: Charles Harley has begun work on the Campbell ground at Forest Hill. A Cornish pump has been put in operation with a steam pump ready in case of any accident to the former. The Pearson and Hawken brothers have made another clean-up at the Three Stars from a twenty-five days' run. During that time they have crushed 200 tons quartz which yielded 197 ounces. The gold brings \$13.79 an ounce. At the Live Oak mine near Forest Hill, the shaft has been sunk 122 feet to bed rock which was found to dip to the south at a sharp angle. The shaft will be sunk fifteen or twenty feet more before a tunnel is begun. The owners are much encouraged by the gravel found on the bed rock. The principal stockholders are Messrs. Cray, Chappellet, and Kates.

Plumas.

ONION VALLEY ITEMS.—*Plumas National*, Feb. 13: Snow is six feet deep in Onion valley. A new bed of gravel has been struck in the Buckeye mine. It prospects well and all rejoice. Foreman Aug. Holtz is of the opinion that it is an extensive find. The Blue Lead on Poorman's creek is being opened up by Messrs. Macaulay, Kelley and Mullen. Their work has discovered a fine lead of gravel and the gold taken out is of a superior quality. Mr. Keifer has just completed an expensive section of his tunnel through a bed of hard cement. However, he feels recompensed, as he struck upon a fine channel of gravel which prospects well. As work progresses in the hill the American proves better.

San Bernardino.

NEEDLE NOTES.—I had an interview with the shippers of ore to Kingman to the mines north of Goff and the A. & P. R. R. The mines that are opened and owned by Messrs. Heise & Raver, are turning out splendid. The Fearnought mine was worked about six days, and the owners realized a clear profit of about \$20 (one man's work). The assay of ore out of the mine goes from \$110 to \$600 to the ton. Heise & Raver own a group of mines called the Fearnought, Buckeye, Bullion, Mollie, Garfield, Morgan and Gertrude; and development will be pushed upon them. Mr. Frank Nicholson & Co. have leased three of said mines, and are making preparations to go to work at once. Messrs. Fisher & Co., have a prospect of doing well on their locations. Messrs. Higgins & McDonald claim to have ore that assays \$800 on their locations. The outlook of the new mines is bright, as the ore pays from the grass-roots down. Three Mexicans just returned from prospecting, for the last fifteen days, out near Old Woman's mountain, report "no find" of placer or other diggings. There is no excitement here now about the mines.

ARROW GOLD DISTRICT.—*Calico Print*, Feb. 14: Arrow mining district continues to hold its own with what development that is being made. Several old prospectors are chloriding on the smaller veins and freighting their ore to Fenner station to be shipped to the best reduction works. Some work has been commenced on the main ledge on a few of the claims. Prospecting still goes on. Johnny Carter found quite a rich vein of gold about three miles from Providence. Several other locations were made in same vicinity. There is now almost a continuous gold belt from Kerr's Perseverance mine about a mile north of here to Granite Pass, 16 miles south of here on the east side of Providence range of mountains.

BONANZA KING CO.—Rumors are rife that this

company with the certainty of the coinage of silver not being disturbed are about to commence operations again. What truth is in the report your correspondent sayeth not.

MESCAL—CAMBRIA MINE.—Expert Roberts who bonded the Cambria mine of Mescal for Los Angeles parties, is on his way out to start up the works.

Shasta.

IRON MOUNTAIN.—*Courier*, Feb. 13: Iron Mountain is situated seven miles north of Shasta, and is connected with this town and the railroad station at Middle Creek by a good turnpike road constructed at thousands of dollars expense. The Mountain, which rises several thousand feet above the bed of the Sacramento river, appears to be a mass of gold and silver ore. The Lost Confidence ledge crops out on an average, three hundred yards in width and a mile in length. Shafts have been sunk on this deposit to the depth of about a hundred feet, and tunnels and cross cuts run from them in every direction, and no termination of the ore body has been discovered. Some six months ago this mine was sold to San Francisco capitalists for \$750,000. The new owners organized a company, appointed A. M. Ellsworth superintendent, and projected reduction and milling works on a scale never before equaled in this part of the state. For months, the heaviest machinery has been freighted to Shasta station at Middle Creek, and the heft on the loaded wheels have taxed the long train of Lee Fader's powerful teams to pull the heavy equipments of the mine up to the mountain, where the question of the value of that mammoth deposit will be practically tested. The Silver King mine near Centerville, the ledge discovered by Brinard and Lowery, is said to show about as good rock as any discovered on the upper portion of the Reading Grant, and experts affirm that the Decker mine on Bulgin Gulch is the best thing discovered in the mineral line in the county except Iron Mountain which is a world-bearer.

Sierra.

MONTHLY CLEANUPS.—*Fribune*, Feb. 10: At the Young America mine \$14,600 was cleaned up this week as a result of last month's run. Owing to the heavy fall of snow at the mine considerable delay occurred in the delivery of ore to the mill, which accounts for the falling off from the amount realized in December. Thirty-two hundred dollars in bullion was brought down from the Cleveland quartz mine this week. The Cleveland is looking well and the owners have cause to feel in jubilant spirits. It is currently reported that the Sierra Buttes mine yielded about \$50,000 for January.

Trinity.

MINERS AT WORK.—*Trinity Journal*, Feb. 13: Miners are at work all over the county, both in quartz and placer mines. The season of 1886 will be one of the most prosperous Trinity county has experienced for a number of years.

NEVADA.

Washoe District.

CHOLLAR.—*Enterprise*, Feb. 13: On the 3100 level a force of men are employed in repairing the timbers and straightening up the main lateral drift south, which extends to the Potosi line. The drain boxes are all right, and carrying off the water encountered at that point. Superintendent Hamilton is in San Francisco at present, and in case it should be decided to go ahead with this drift and push into or through the Potosi ground, it could be done with the most perfect facility. The main pump rod of the Cornish pump in the Combination shaft broke yesterday morning, yet that will make no difference to the drainage of this or the other two middle mines, as the hydraulic pump, in connection with the bailing tanks, meet the requirements of the situation all right. Sinking the Combination shaft deeper is in contemplation, and liable to be resumed shortly.

CON. CALIFORNIA AND VIRGINIA.—The last official report from the mine says: On the 1400 level the west drift from the C. and C. shaft has been extended 87 feet; total length, 364 feet. On the 1650 level the northwest drift has been extended 25 feet; total length, 527 feet. On the 1950 level the old west drift from the station in the C. and C. shaft is being reopened. During the week 89 tons and 1735 pounds of ore were shipped to the Morgan mill, and 1653 tons and 1880 pounds to the Eureka mill. The average value of the ore milled during the week, according to the battery sample assays, was \$75.22 per ton for that crushed at the Morgan mill, and \$13.07 per ton for that crushed at the Eureka mill. During the week bullion valued at \$64,736.69 was shipped to the office in San Francisco.

HALE AND NORCROSS.—The bottom of the deep winze from the 3000 level has attained a depth of 25 feet below the 3200 level, thus forming a sump for the reception of any possible water which may be encountered. Superintendent Keating, now in San Francisco, is liable in a day or two to order the deeper sinking of the winze to be stopped and drifting both south and north to be commenced, to connect with the proposed 3200 level of the Combination shaft, and also to explore and develop the rich diamond drill prospects developed recently near the Savage line below the 3100 level.

YELLOW JACKET.—Still yielding the usual amount of ore from the old upper levels and keeping the Brunswick mill steadily running. The Golden Gate concentrator in use at this mill is a very good success, so far as concentrating a certain portion of the ore from the mine containing free gold and heavy black sulphuret of silver, but it does not and cannot concentrate the chloride ore, which composes seven-eighths of the ore deposits of the Comstock lode.

UNION CONSOLIDATED.—On the 500 level a new lateral drift north has been started from the east crosscut, at a point 360 feet east of the main north lateral drift, No. 1. It is being run in a very favorable ore vein formation and is already in 90 feet, showing very encouraging material.

OPHIR.—On the 300 level the west drift from the old Mexican shaft is now in 152 feet, 32 feet having been added during the week. On the 400 level the lateral drift running north from the west drift from the old Mexican shaft has been extended 33 feet, making a total of 243 feet.

CROWN POINT.—Ore extraction goes steadily ahead from the old upper levels, with a goodly contribution of better grade from the 1700 and 1750 levels. Some very good grade ore is also coming

from the Belcher mine, which is worked through the Crown Point.

GOULD AND CURRY.—Since starting the pumps the water has been reduced in the Osborn shaft, of this mine and the Best and Belcher over 200 feet, and it is being lowered at the rate of 10 or 12 feet per day. The machinery works splendidly.

SIERRA NEVADA.—On the 520 level the main north lateral drift continues in a very dry porphyry formation, with occasional streaks of quartz and clay. Its total length is 1751 feet, 28 feet having been added during the week.

ALTA.—On the 700 level the lateral drift north toward the Benton ground continues making fine progress in good working ground.

Columbus District.

HOLMES.—Candelaria *True Fissure*, Feb. 12: Sixty feet west of Cross development we have a good stop of ore. The Creer has improved very much during the past week. The stop is increasing in length. It is 12 feet wide and the ore is good. The drift running west from Creer has 3 feet of very high grade ore. The silver stop 4th level looks well. We have a prospect at this point. The ore averages \$150. Everything at mill and mine is in good order and doing good work. We ship you by this day's express 19 bars of bullion valued at \$88,018.09.

MR. DIABLO.—We have connected the shaft from the lower intermediate, between the 1st and 2d levels with upper intermediate between these levels by a south cross-cut, and have 4 feet of \$50 ore at the place of connection. This raise is now as high as the 1st level and we will start a south crosscut to connect with this raise in a few days.

Jackson District.

PROSPECTORS.—*Silver State*, Feb. 10: E. M. Le Barron and Charles Bernard are in from Jackson district. Work is progressing steadily on the Pennsylvania mill and mine. There are 35 men in the district, all at work. The Pennsylvania looks well, and is yielding considerable ore. There are several prospectors in the mountains, and new strikes are reported every little while. A mineral deposit has been discovered within a half mile of the mill, which resembles the Silver Reef ore in Utah. The formation is slate and sandstone, and the ore resembles what miners call black metal. Blocks of ore weighing over a hundred pounds each have been quarried out near the grass roots, but there is some doubt as to its value. The ores are different in every vein discovered, and as the district is comparatively new, miners and prospectors do not yet know their value.

Lovelock District.

NICKEL AND COBALT.—*Cor. Silver State*, Feb. 14: Our mines are attracting some attention. The nickel and cobalt mines in Cottonwood canyon have been bonded by an English company who mean business, and will thoroughly prospect them. Bernice is again producing bullion and making regular shipments, which in the last three weeks have aggregated over \$9000. The Bothwell mill is running steadily on custom ores, the price of milling having been reduced to 35 per ton. An important strike has been made in the Hoyt mine, which shows a two-foot vein of rich ore. W. W. Williams is running a tunnel to tap the lead in his mine at a considerable depth, and important developments are expected when the vein is reached.

Peavine District.

THE PLACERS.—*Reno Gazette*, Feb. 10: The claim being worked by Chamberlain and Kinkadee is the old Lingle mine, in Lingle canyon, where O'Neil, Lingle and Kinkadee used to mine. Their last run was made six years ago, when they received \$1,800 apiece as their share. Lingle is said to have made \$9,000 out of the claim himself. After they quit the claim McLain and Bob Hoy got hold of it, and Ollie Perry, the present owner, bought it of them. Chamberlain and Kinkadee leased it of him for a percentage of the net profits. The claim is heavy with iron and most of the gravel is full of black fragments of wash, and every pan shows gold. The iron cap from which the drift seems to come is exposed on the side of the canyon opposite Chamberlain's cabin, and it has tempted O'burn, Shoemaker and Ed. Dalton to do some work in the hope of uncovering the ledge where all the gold comes from. They have only got in a few feet, but they get plenty of rich dirt, and yesterday struck a clay wall which may cover a ledge. D. Harlan and Dalton are pushing the work and feel very confident. Frank Cook and Norton are up on the mountain gathering up the threads of water and turning them all down Lingle Canyon. They have 20 inches of water flow, and think that with Bob Hunter, Golden Preece and Peavine Canyon they will have a hundred inches for several weeks. They have a fall of 80 feet, and from their ditch have laid 520 feet of six-inch pipe. They have 75 feet of canvas with copper pipe to connect the nozzle. They have two nozzles, one an inch and the other one and one-quarter inch. The sluice boxes will run down 120 feet. They are 14x16 inches, and ripples 2x3 inches. There is plenty of pay dirt, as every pan Chamberlain has tried shows from a color to a bit's worth of gold. At Dutch Flat five cents to the cubic yard of gravel pays big, and if the water holds out here the banks will pay well. In fact, gold can be found anywhere along the north flank of Peavine for five miles. Lingle canyon is a narrow gulch leading up between low sage-covered hills, rising rapidly up to the mountain. The pay dirt right where Chamberlain is operating is only a few feet thick, and lies on a bed of yellow clay, which is barren and below which there is nothing. Lingle ran a tunnel into the hill 90 or 100 feet, but it showed nothing. Jersey McDonald and Harry Clark have taken up the claim next below, and are ground sluicing it.

Pioche District.

REDUCTION WORKS.—The Bullionville Smelting Company's reduction works, which have been in the course of construction for the past four months, were completed on Monday, and a start made. The works include a large Steinfeldt furnace, two revolving roasters, a leaching plant of ten redwood tubs, and a furnace for melting the sulphides. The works are the most perfect of the kind on the coast, and reflect much credit on mechanics Grant, Morris, Stevens, Rich and Murdock. The estimated cost of these works is \$100,000. The company intend to work after a little, about 100 tons of tailings in twenty-four hours, at which rate it will take them some four years to clean up at Bullionville and Dry Valley, but as they intend to work custom ores in conjunction with

the tailings, Bullionville is destined to be quite a place for many years to come.

A CHANGE FOR THE BETTER.—*Pioche Record*, Feb. 10: Tales in regard to the resumption of work in Raymond & Ely and Meadow Valley mines have gone forth, and letters are pouring in from ex-Piochers abroad, making inquiries about matters. The facts are simply this: There is a company formed for the purpose of taking hold and operating mining property here, but they will have nothing to do with any property that they cannot obtain a clear title to. They want no trouble on their hands after they pay for and take charge of the property. As to things booming again in Pioche soon, we have our doubts, but we expect a change for the better to take place the coming summer, that will make times better in old Pioche than they have been for several years.

Rebel Creek District.

LOOKING WELL.—*Silver State*, Feb. 13: J. McGrath, superintendent of the Wild Deer mine, at Willow Creek, is in town, on his way to San Francisco. He says the lead is looking well, with thousands of tons of ore in sight, between the 100 and 200 foot levels, that will average \$40 to the ton in gold and silver. The mill, a five-stamp one, is running, and all the ore worked to date averaged \$7 in gold and \$45 in silver. The Ohio mine, in the same district, is producing very rich ore, and a new body of considerable extent has recently been cut in the mine. The Great West, a gold bearing lead, owned by H. H. McColey, has been leased to James Wilson, who is now taking out ore in which free gold is visible to the naked eye. Andy Shrewsbury is working on his gold lead, and frequently finds ore that is worth over one dollar a pound. Mr. McGrath has a lot of specimens from the Wild Deer, in which gold is visible, and which assay from \$300 to \$1000 in silver.

Taylor District.

HOISTING WORKS FOR THE ARGUS.—*White Pine News*, Feb. 12th: Two wagon loads of the machinery recently purchased by Mr. Underhill at Pioche, consisting of boiler, reel and wire cable, arrived in town yesterday. They will be put in place as soon as the work can be done as they are much needed, and will no doubt save much hard labor now being done by man-power at the mines.

A WRONG IMPRESSION.—Many of our State exchanges, and some outside of the State, are giving Taylor a big boost just now, which seems to be attracting a good many people to this place in quest of employment or business, mostly the latter. We wish we could join our neighbors of the press in these rosy views of our town and district, but our regard for the truth will not permit us. That Taylor has and is, and will continue to be, a bullion producer on a scale more than commensurate with the capital employed, is very true. But that capital is not large, nor is it likely to be increased to any great extent by the recent sale of the Monitor property. If a change for the better has been made by the recent purchase it is not yet apparent here, nor is it likely to be felt before mid-summer. Strangers are daily arriving in our town, no doubt being lured hither by the unreliable statements of the outside press. There are now here from 25 to 30 men, mostly old employees of the Monitor and Argus companies, out of work, who will, of course, in most cases, be given the preference to new men, when the force is needed in our mines. In view of these facts, it is almost wicked in our exchanges to publish such articles as are calculated to lure more workmen to Taylor. They are not needed here; there is no work for them, and they will be disappointed if they come.

ARIZONA.

CHLORIDE.—*Mohave Miner*, Feb. 9: The old and well-known mining camp of Chloride, about five miles north of Mineral Park, seems to be indulging in a quiet little boom of its own. Although it makes no pretensions to being a lively camp, still considerable work is being done on the mines in and around it, and there are more men employed in them than one would suppose. This may be said with equal truth of many other mining camps in our county. The Tuckahoe is a good claim, on which a considerable amount of work has been done in former years. On the Independence, Charley Sherman has three men constantly at work, and is still taking out the usual quantities of the rich ore for which this mine has become noted. Mr. Sherman's last shipment netted him over \$400 per ton. The old Crow is a new location which is being worked by Chas. Richardson. He is running a tunnel on the ledge, and is now in about 30 feet, and has a good streak of 100 ounces ore right along. The Connor is one of the mines owned by the Arizona Northern Mining Co., and is now being worked under the management of Mr. John Barry, the superintendent of the company. He has about six men stopping and drifting. The mine is yielding ore that runs from 100 to 150 ounces. The Sunlight is another good claim owned by Mr. Barry, on which the work of development is now going on night and day. The ore from this mine is rich in native silver. The Empire is one of the oldest mines in the neighborhood of Chloride, and has always been considered one of the best. It has been lying idle for some four or five years, but is now being worked by the Oliver Bros., under a lease. They have been working about a month, and a few days ago made their first shipment of ore which sampled about 400 ounces to the ton. The Altata is being worked by Johnny Goshorn, who is stopping out a nice bunch of ore which samples about 160 ounces. The Diana is the special pride of James Cadden, who has spent many a long day in opening it up in good shape. There are few claims about Chloride on which more work has been done than on the Diana. In this mine the ore streak is large but low grade. The Schenectady is a lead mine carrying about 75 ounces in silver and from 30 to 40 per cent lead, and owned by the Benson Smelting Company. It is now being worked by Mr. Brakeman under a lease. The Pearl is another late find which is being worked by Messrs. Mendes and Hallaway, who are getting assays as high as \$900 from it. There are many other claims being worked in this vicinity, notably one near the Connor, owned by H. S. Carpenter, on which Michael Labrosse has a nice little streak of \$800 ore, but lack of space prevents a more extended description at the present time.

RAMBOZ CAMP.—*Cor. Silver Belt*, Feb. 9: The Comet Silver mine, formerly the Miami, owned by

J. B. Henry, F. F. Burke and E. L. Winterberger, is located about half a mile south of this camp. It shows considerable surface work, which was mainly done by the Miami Company, but with the exception of an incline sunk to the depth of 75 feet, the work done scarcely deserves to be classed as development work. Notwithstanding this the company gouged out ore enough to net them \$16,000. Besides this the present owners have taken out sufficient ore to increase the output to date to over \$20,000, to say nothing about 150 tons of low-grade ore yet on the dump, that will work from 35 to 50 ounces of silver per ton, which I consider a creditable showing for a little surface scratching. The general character of the ore is a copper silver glance, carrying some native and chloride of silver, some of which remains in sight in the mine. The J. Gould mine, originally the Ramboz, owned by W. V. Kingsbury, is located parallel to and adjoins the Comet on the west. The main shaft is down 80 feet; besides this there are various open cuts and tunnels at different places on the ledge, all of which show a well-defined vein from three to four feet wide, which is traceable by the croppings the entire length of the claim, 1500 feet. This mine has produced so far 160 tons of ore that averaged at the mill nearly \$200 in silver per ton, and there is on the dumps at the present time about 150 tons of second-class ore, that will yield from 40 to 50 ounces of silver per ton. The ore found here is grey carbonate of lead, carrying chloride of silver. The Rescue mine, owned by L. J. Webster, is situated west and parallel to the J. Gould. The main shaft on this claim is down 100 feet, having many other shallow openings, nearly all of which expose a splendid vein from two to four feet wide. This claim has returned to the owner about \$30,000, and there is at present on the dumps about 200 tons of low-grade ore that will yield from 50 to 60 ounces of silver per ton. The character of the ore is silver glance and sulphides with a small per cent of chloride.

COLORADO.

AT LEADVILLE.—*Denver Tribune-Republican*, Feb. 11: It is gratifying to note that the Robinson mine is again a heavy shipper, and has once more declared a dividend of \$10,000, payable on March 1. The Argo works of this city has a contract for Robinson ore, calling for about 6,000 tons. Steady work and economical management are gradually bringing these so-called played out mines back to a profitable status. Most of all the once famous mines at Leadville that were deemed exhausted of ore are again in pay with favorable chances of encountering other heavy deposits of pay mineral. A great deal of prospect work is now being done to encounter continuations of old ore chutes, or for the discovery of new ones, and this year will witness some important developments from this class of operations. In fact, in all parts of the State miners are thoroughly prospecting and are enthusiastic over the promise of striking ore bodies that have been untouched simply because they had no surface outcrop. Miners in reality are studying underground indications instead of surface indications as formerly, and this new departure has already resulted most beneficially to them. The fact that one ore chute is exhausted is not so discouraging a feature as heretofore, since knowledge has been gained where to look with a reasonable degree of certainty for fresh deposits of like character. The present year will not show the usual number of new mining camps, but more important discoveries will be chronicled. The *Silver Record* of Gothic under the head of editorial correspondence, says: Leadville is again taking its place as the boss mining camp in the world. At the present time there is more work being done around Leadville than ever before. Where one year ago there was one property being worked now there are four; where, last spring, whole streets were nearly depopulated, now every little house is occupied with families, and with all this increase of population there are less idle men than ever before. In fact, miners do not now have to look for a job, for there are not enough miners to fill the demand.

DRILL AND HAMMER.—*Eler Mt. Pilot*, Feb. 12: At the Sylvanite mine Mr. Fore is still running the drift on the vein from the bottom of the shaft. The shaft is about 150 feet deep from the tunnel level, and from the surface something over 300 feet deep. The drift from the bottom of the shaft is over 150 feet long. The company only have about fourteen men employed now, but if they carry out the plans talked of next summer, they will employ a much larger force. There has been a sale pending on the Black Queen mine for some time. This property is situated on Sheep mountain, on Rock creek, and has taken the lead as a producing mine on that mountain, probably because it is further advanced in development. The character of the ore is ruby, black sulphurets and native silver in decomposed black lime, between well-defined walls. The Bullion King mine, in the Ruby district, is working over 20 men at present and is looking remarkably well. Mr. Ropell is still drifting on the other vein from the lower level, and finds the vein as good as expected from that depth. The Forest Queen mine, at Irwin, is now producing more ore, and has larger reserves in sight than at any time for three years past.

IDAHO.

THE IDA MAY.—*Wood River Times*, Feb. 12: Jack Galbraith, who has just visited the Ida May mine, on Lookout Mountain, which is principally owned by H. R. Plughoff of this city, says that the property is a very promising one indeed. The ore-vein is 10 to 12 inches wide, of "solid truck" that assays from 300 to 400 ounces per ton, the ledge is strong, regular, and shows a nearly uniform width the full length of 40-odd feet exposed by the drift. The workings are about 125 feet deep. A car-load of ore is on the dump ready to ship, and as much more can be extracted when wanted without stopping. In fact, the workmen will have to extract no considerable quantity in drifting.

NEW MEXICO.

STRIKE.—*Socorro Bulletin*, Feb. 12: James Stephens has made a rich strike on the summit of the Magdalena mountains, and has named his claim after the advanced liberal Joseph Cowen. He showed us a sample of some of the finest ore we have ever seen from this district, and if the lead holds out he has certainly struck it rich. It is rumored that the rich placers and gold quartz veins in

the Corrillos district will very soon again be worked, and the rich deposits will once more hum with busy human life. The president of the New Mexico Mining Company, which owns the Ortiz mountain and the placers, has arrived in Santa Fe, and great things are expected from the more rational and liberal policy which the company seems disposed to adopt in its relations with the miners. We can only hope that these rumors have solid foundation. The old placers are one of the richest, if not the richest, gold fields in America now remaining unworked. There is no prospecting to be done; its riches are known, and it is quite time that legal difficulties should be adjusted and the mining community be allowed to have an innings.

OREGON.

PLACER AND QUARTZ.—*Jacksonville Times*, Feb. 12: Although none of the miners have cleaned up, considerable gold-dust is finding its way to Beekman's banking house already. The rains of the past week have been very acceptable to the miners, as the water supply had commenced to diminish in some districts. Geo. Cardwell has located to quartz mine in the Sterling district, that seems to be quite extensive, and the ore from which assays well. Work on the site of the proposed quartz mill in this place is progressing rapidly, and the building will be ready for the machinery before long. Turner & Johnson have run a crosscut to tap the Rising Sun ledge, and a large body of ore has been exposed, a test of which is being made. John Blalock and Geo. Owings of Evans creek are prospecting at the head of Jackson creek, and have found some promising quartz and placer prospects. When good weather comes much prospecting will be done. The mineral resources of this country have never received half the attention they merit. The machinery for the quartz mill at this place has been shipped and will soon arrive. The crushing of quartz will no doubt commence in the near future. Frank Legg and John McDonnell are very busy at their hydraulic claim on Jackson creek and have every prospect of a profitable run. They have one of the richest claims in Jackson county. Quite a number of prospectors are at work in the Applegate district, some of whom report excellent prospects. Anderson & Walker have a presumably extensive ledge, which assays as high as \$90 to the ton. Capt. Saltmarsh was in town this week, from whom we learned that his company has plenty of water once more and is making the most of it. They have rich diggings, but have not had enough water for several seasons past to work them. M. D. Hopkins of Grave Creek, who is in town, informs us that the miners of that section have an abundance of water and the prospects are favorable for the best cleanup in several years. Considerable prospecting is also being done there.

PINE CREEK NOTES.—*Cor. Bedrock Democrat*, Feb. 9: The weather at present is fine, but for the past three weeks, with the exception of three days, it has been very stormy. The snow is now five feet deep, but the roads are open. Building is now at a standstill, owing to a scarcity of lumber, but it would be almost impossible to get a mill in and saw any lumber before the first of May, if that soon, for the roads in the spring are very bad until June or later. The Oregon Gold Mining company are driving work ahead at their mine, as fast as money, muscle and brain will do it. Their two-compartment shaft is down over 50 feet, and is finely timbered, strong enough to last for a century. For the past four days their road has been blocked so that it was impossible for teams to get through, but it is now shoveled out. To clear the road it was necessary to make a cut 15 feet deep and 8 feet wide through a snow slide. The snow is 7 feet deep in the road, but it is solid enough to hold up the teams, and as this is the only way of getting timbers to the mines, the company will probably be better prepared before next winter. The company will commence the erection of their large stamp mill as soon as sufficient lumber can be obtained for the purpose.

Jas. McDonough is mining at his placer diggings, near Fort Lane, and has already picked up several fine specimens of quartz, which are full of gold. Evidently, a very rich ledge exists in the immediate vicinity. Deselles & Connell, of Scotch gulch, Josephine county, who own one of the best and most regularly paying mines in the State, will, no doubt, do better than ever, as a much more extended season is assured. Keaton & Klippel, McKee & Co., and several other hydraulic miners in the Foreman's and Forest creek districts are working day and night, with full heads of water and good prospects. All the others are also busy.

UTAH.

REVIEW.—*Salt Lake Tribune*, Feb. 5: The great event of the week in mining circles was the starting up on Tuesday morning of the renovated and reconstructed Marsac mill, at Park City, Utah, on Daly ore, by the Daly company. The full thirty stamps are now running, and this "second Ontario" may be depended upon to begin shipments of bullion the course of a week or so that will be steady and strong. For the month of January the receipts of silver and base bullion amounted to \$328,822.66. This is exclusive of ores either received or shipped. The receipts of bullion and ore in this city for the week ending February 27, inclusive, were as follows: Bullion, \$24,707.27; ore, \$54,950; total, \$139,657.27. For the previous week the total receipts were \$132,406.55, of which \$78,936.55 was bullion and \$53,470 was ore. It will be observed that the ore receipts for the past fortnight have been remarkably heavy, indicating a better market here for ores than heretofore. At the same time the ore shipments away from here have fallen off in a corresponding degree. The shipment of five cars of Horn Silver ore does not appear to have been followed by others, and though there has undoubtedly been ore trapped in the mine, nothing can be learned of the extent or richness of the body. During the week base bullion to the value of \$10,990 and fine bars valued at \$31,600 were received in this city, besides specific products named herein. The Stormont sent up silver bars valued at \$4,000. Stormont stock, 1000 shares, sold in New York on the 23d ult. at 15c. The Hanauer smelter produced during the week four cars of bullion, 12,590; the Germania, five cars, \$12,737.27. Ore receipts for the week were—miscellaneous, \$18,250; silver and lead ores, \$30,000; silver ores, \$6,700; total, \$54,950.

SYRUP OF PRUNES

THE CAL. PRUNE LAXATIVE.

The only perfect fruit remedy for Constipation and Biliousness. Mild and effective in its action. Safe for ladies, children, and weak constitutions. Purifies the Blood, tones up the Stomach. A pleasant substitute for nauseous pills. Sold by all Druggists and Country Dealers. Large bottles, 75 cents.

THE GREAT NERVE TONIC.—Unsurpassed as a remedy for General Debility, Sleeplessness, Indigestion, Neuralgia, Rheumatism and Broken-down Constitutions. Sold by all Druggists and Country Dealers.

BEWARE OF IMITATIONS. TAKE ONLY DR. HENLEY'S.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

The Best LOW GRADE EXPLOSIVES in the Market.

SUPERIOR TO BLACK OR JUDSON POWDER.

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,

18 California Street, San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO, CAL.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take the nut off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

RANKIN, BRAYTON & CO.,
... BUILDERS OF ...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, crushing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE of OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE BEING SUFFICIENT to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an ANALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES THE BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 600 feet of five-eighths steel rope. SEND FOR CIRCULAR.

SEND FOR CIRCULAR.

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. Referencee first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.
E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

STURTEVANT MILL.

This Mill as a Crusher and Pulverizer is without rival. Is in operation in leading smelting works and mills.

Mining Share Market.

There is no special feature to record of the mining stock market. On the Comstock development work progresses as usual, and assessments continue to be levied as in times past. The pumping out of the Osborn shaft of the Gould and Curry and Best and Belcher mining companies, goes steadily ahead, and it is merely a matter of time when the water will all be out and the sinking of the shaft resumed to sink to a depth corresponding with the 3,200 level of the Combination shaft and middle mines.

Meanwhile the deep winze of the Hale and Norcross mine has already reached the 3,200 level and about 25 feet below it, for a sum or shaft drain.

One extraction is resumed above the 3,000 level of Hale and Norcross, and something interesting is hinted at in that line and direction before long.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Improved Portable Hoisting Engines

...SOLE MANUFACTURERS OF...

KENDALL'S PATENT QUARTZ MILLS.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are now enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past five years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that claimed for it and give entire satisfaction.

H. M. NEWHALL & CO.,
GENERAL AGENTS,

THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manu-
facture. All similar styles are infringements upon this form, and a judgement stands of record to that effect, under
the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

IMPROVED
HYDRAULIC
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT
instead of two. It is of greater capacity and more easily worked
and kept in repair. The statement of Mr. Hendy that all styles are infringe-
ments on the machines made by him, he knows to be utterly false. All
litigation has been in reference to old style two jointed machines, which
are superseded by our new style one jointed. The decision of Judge
Sawyer, referred to by him, is carried up on appeal to U. S. Supreme
Court, with absolute certainty of a reversal in our favor. Send for
Circulars and Price List. HOSKIN & CO., Marysville, Cal.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

We are manufacturing from Special Designs of the most experienced and successful Practical and Scientific Experts, Complete Plants for all descriptions of Mining Operations, as follows:

CONCENTRATING MACHINERY—Best and Cheapest, Cornish Rolls, all Steel Wearing Parts, Most Practical Styles of Two, Three and Four Compartment Double and Single Jigs, Sizing Screens, Patent Hydraulic Separators, Tables and Concentrators.

STAMP MILLS for Reduction of Gold and Silver Ores, whether free milling or base. Most useful and substantial styles of Single and Double Discharge Mortars, Wet or Dry Crushing.

STEEL SHOES AND DIES, Tappets and Cams, cheapest and best Blake Improved Rock Crushers and Automatic Ore Feeders, Superior Amalgamating Pans with wood or iron sides.

PANS FOR TREATING GOLD ONLY, Settlers, Clean-Up Pans, Retorts, Furnaces, Dump Cars, Hoisting Machinery, Cages, Landing Dogs, etc.

CORLISS, MEYER'S CUT-OFF AND BALL'S PATENT VALVE Engines of extra strength and durability.

STEEL BOILERS of Two Sheets only, Steel Economic Boilers, combining with the safety, durability and economy of the Stationary Boiler, the conveniences and portability of the Portable. It occupies but little space, and is the best and cheapest boiler ever made.

WE ALSO MANUFACTURE SAW MILL MACHINERY.

We are also Sole Agents for the Gordon and Maxwell Steam Pumping Machinery, and carry a full stock of all kinds of Mill Supplies, including the

Albany Lubricating Compound and Oils.

\$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
 (\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,
Publishers.

SAN FRANCISCO, SATURDAY, FEBRUARY 27, 1886.

VOLUME LII
Number 9.

The Assaying Laboratory at Berkeley.

In the mining department of the University of California there is a very complete assaying laboratory. It offers facilities for assaying, by the most improved methods, ores of gold, silver, lead, antimony, tin, iron, nickel, cobalt and quicksilver, as well as fuels, mattes, slags, speiss and bullion. This laboratory occupies two floors of the mining building. The lower floor is devoted to fire assays exclusively. The crushing and sampling room contains a Taylor's hand-crusher, large iron mortars and rubbers, a sink, with bateas and a miner's pan, for washing ores, an assortment of sieves, and a large sampling table. The mixing or fluxing room contains desks with pulp scales and hoxes containing fluxes, a Fairbanks scale, and a hood with gas burners and stands for parting gold and silver. The furnace room contains four crucible furnaces and three muffle furnaces, arranged for burning coke; also, large muffle and crucible furnaces for burning soft coal, like those in use at Freiberg and Przibram. These furnaces have all been carefully designed, are built into the walls, and iron-clad in a substantial manner. The weighing room contains four of Becker's assay balances. A convenient storeroom completes the lower laboratory. On the floor above, a large room, devoted to bullion and volumetric assays, contains a pair of iron-clad muffle furnaces, Hoskins gasoline crucible and muffle furnaces, parting hoods, a galvanic and a thermo-electric battery, a one-horse power petroleum engine, work-benches, tools, and a pair of steel rolls; another, lighted by yellow glass windows, is devoted to the humid or mint assays; a third, for special investigations, contains a gas muffle furnace and one for crucible assays, a water-blast blowpipe, and a distillation apparatus; a fourth, a special balance room, contains the finest Oertling and Becker assay balances. Besides the above, the laboratory is supplied with a very complete equipment for measuring high temperatures, such as an air thermometer, a Fisher calorimeter-pyrometer, and a Sieman's electric pyrometer; also, the Orsat, Bunte and Fisher apparatus, for analysis of furnace gases. All the appliances are of the most approved pattern. The only charges to the student are for materials actually used.

PROGRESS OF ELECTRICITY.—His Majesty, the King of the Belgians, in 1876 instituted an annual prize of twenty-five thousand francs (\$5,000) for the encouragement of intellectual researches. The prize in 1889 will be international and will be granted the author of the best work upon "The progress of electricity in its uses as a motor and for lighting purposes, with all applications that can be made of it, for such purposes, and the economy and advantages which its use may offer." All foreigners desirous of competing will be required to send their works in manuscript or printed before January 1, 1889, to the Minister of Agriculture, Industry and Public Works, Brussels. A new edition of a printed work will be accepted if it presents new features and much greater information than the preceding edition, and the date of publication be not earlier than 1885. The competing work may be written in English, French, Flemish, German, Italian or Spanish, and, if in manuscript, will be required to be published within a year after the granting of the prize.

SECTIONAL VIEW OF OHMEN-SIMMONS VALVE MOTION.

END VIEW OF OHMEN-SIMMONS VALVE.

In the Superior Court of Yuba county last Friday, Pat. Campbell, Joseph Rigby and Ah You were fined \$500 each, and James Devers \$50 for contempt of court, by reason of violating an order of the court which enjoined the Golden Gate mine at Smartsville from hydraulicking. All the fines have been paid.

The Old Dominion mine property at Globe, Arizona, has been sold under execution by the judgment creditor for \$105,000. The whole amount of the sale was \$130,000.

ANTIMONY is selling in Liverpool at £35 to £36 per ton.

The Ohmen-Simmons' Valve Motion.

As will be seen from the engraving, this valve consists of a taper-plug main valve, with a cut-off valve of the same shape inside of it, having an inlet on one side and steam and exhaust ports on the opposite. Both ends of the valves are closed, the larger ends being provided with trunnions. The valve stems are on the smaller end and have on their outer ends, which pass through a sleeve on the valve casing, cranks which are operated by the eccentrics.

To obtain a steam-tight connection between the casing and the main valve, a packing is provided, the upper end of which is let into neck of the steam inlet and the lower side fits the shape of the valve, the packing being held down by pressure of steam. Unseating of valves is obviated by allowing steam to pass through the trunnions into the recess in which they work, the area of the trunnions being sufficient to overcome the tendency of the valves to leave their seats on account of their taper. Collars are placed on the stems to prevent the valves from being forced too far in.

Condensed water is allowed to escape through a recess in the stem of the main valve and sleeve and casing; no packing is required on the stems. By cutting grooves from the exhaust cavity, a free circulation of steam is obtained over the back and ends of the main valve, for the purpose of lubrication and prevention of clogging by oil sediments.

The operation of the main valve is the same as a slide valve, while the cut-off valve regulates the supply of steam from zero to three-quarters' stroke. The cut-off valve is operated by a shaft governor, which is also patented, steam being supplied from the interior of the valves; both are therefore necessarily balanced.

Three years steady running in a flour mill on a 350 horse-power engine in this city, with 90 pounds steam pressure, have proven that there is not the slightest wear to a valve of this kind. It is also running in a number of other places here. The attention of Eastern engine builders is called to this valve, as rights to use it can be secured. This valve motion is equally adapted for high running as well as slow running engines. It is patented by W. H. Ohmen, 22 Fremont St., in this city, who is an engine manufacturer.

Copper.

Copper continues to command a higher price in New York than in Liverpool. The American shipments to England and France in January, 1885, were 4344 tons, whereas in January, 1886, there were only 1595 tons. In fact 150 tons of American matte recently shipped to Liverpool, was reshipped to New York for sale. The difference in American and English estimates of production of this country for the last year is considerable. The American figures show a production of 67,500 tons in 1885 against 63,556 in 1884. James Lewis & Sons' report on ores and metals says these figures, if correct, show that stocks in the United States must have diminished considerably, as the import into England and France in 1885 was 8753 tons larger than in 1884. The United States sent to England last month 1351 tons of copper; Chili sent 1887 tons. The total visible supply of copper, as estimated by the reports referred to is 58,646 tons 6ne. The imports from Chili into Liverpool and Swansea in January were 2174 tons.

The Comstock Lode—Its Immensity and Comparative Wealth—Its Possibilities When Adequately Explored.

[By our Special Correspondent, J. B. P.]

The developments in the past in this bonanza camp have been amply sufficient to reveal the imperfect and haphazard nature of the difficult undertaking from the outset. A block of territory some two miles in width and eight miles in length, filled up with gold and silver lodes, cropping out from every knob, and sharply bisecting every stretch of ravine, is apt to confuse the unpracticed eye, and to afford plenty of speculation even to the most skillful. If ever a philosopher existed this side of the Socratic age, in the study of physical laws, that being may well be represented in the cool, careful and well-balanced thinking miner. From the visible and tangible, he is prone, of necessity, to dwell upon and discuss the invisible and the occult. In comparison, it would be an easy task for one to roll his very convenient tub around, after the manner of the great Diogenes, and speculate upon the uncertain fortunes of men and State; but when, with the most meager data and the feeblest rays of silver light to guide his course, the astute miner is induced to drop his plummet line of exploration more than three thousand feet down into the bosom of the rocky earth, in order to sound for new bonanzas, we have presented a practical faith horn of a philosophic principle that commends itself to the wisest and noblest minds of all ages.

Whilst we speak thus of the true quartz miner as a practical philosopher, we would not by any means, have the reader infer that we purpose to follow up the subject in the same strain and invest the present article concerning this camp with anything that partakes of the dreamy or the speculative. As in our previous contributions, we purpose to offer some practical suggestions, that have forced themselves upon our attention as we have traversed and inspected for ourselves the upper and lower levels, as well as the surface outlines of this wonderful silver mountain. Irrespective of the

Great Revolution now Going on

In the expense of ore reduction, and which appears destined, very soon, to convert ten dollar rock into fabulous bonanza, we shall only shape our remarks upon the basis of previous discoveries, and former workings in these mines. These will be amply sufficient, we believe, to admit a few rays of light upon a topic so intensely absorbing, to the mining operator here, as well as to the interested public abroad. Comprehending a score of years, and such a harvest of mineral wealth, nothing like an equivalent advertisement has ever been given to any similar mining project, in modern times, as was achieved by this camp. With such a prestige, the eye of critical curiosity rests with peculiar force upon the hive of mining industry located here, anxious to learn, at the earliest possible moment, what turn may be given to this consolidated effort of capital and labor.

In Reviewing this Camp

No thought is apt to fasten itself sooner perhaps, upon the reflecting mind, than the one which recognizes the comparative insignificance of the means and resources that have been applied to disclose and extract the deeply rooted and valuable ores from the base of this mountain. The common ant, it is affirmed, will not construct its hillock where it cannot obtain water, sometimes boring into the earth 40 feet, or more, to attain this desideratum. This example if imitated by civilized man in his search after mineral wealth, would, in proportion to his size, take him more than 6000 feet below the earth's surface. If this humble insect can achieve this much for supplying its daily necessities, what would naturally be expected of ambitious man, in his efforts to acquire his most permanent and costly riches? Possibly the language of Solomon, concerning this insect would be very appropriate at this time for those who have no faith in deep mining when he says, "Go to the ant, thou sluggard: learn of his ways and be wise." But as the newly discovered bonanzas of Leadville, during the past month of January 1886, appear to have so effectually exploded the sophistries urged against deep mining, we deem with pleasure a class of views, which on fuller and more careful investigation, we feel assured would never have been brought to the surface from respectable sources.

The ancient natural philosopher and mechanician Archimedes, boasted at one time, in the presence of his credulous admirers, that if they could furnish him a place to plant his lever, he would move the world. As the world still moves in its usual orbit, it is quite probable that his friends found no suitable place to locate his mammoth engine, or catapult. Still as the mechanism of his times, of more than 2000 years since, was found adequate to burn a hostile fleet in the harbor of Syracuse, by means of an immense concave mirror, it proves what gigantic strides were made even in that dimly

remote age, to supplement the feeble powers of man, through mechanical agencies. Nature seems to utter her voice on every hand, to the human family and speaks to man in this wise, "Come and take me." When he finds his arms too short, or his bare physical forces too weak to accept the generous invitation, he is compelled to stretch out other arms formed of steel, steam, water, fire, wind, electric currents, or whatever else may be found available or controllable to secure the coveted treasures.

What most affects and concerns his reasoning faculties are such queries as these: "Will the end justify the use of the means? What is the rationale of the whole investment? Will the income correspond with the output? Do the probabilities of success more than balance the probabilities of failure?"

Having won success in one, two, three or half a dozen instances in this same field of labor, are the grounds quite as probable now that I shall win success again, if similar trial efforts are put forth? Never possessing certainties from the beginning in regard to any future developments, am I as well pleased now with the basis of all my previous successes to wit, probabilities on which to prosecute the same class of work in the present and the future as when I first won the prize? Finally, have I taken into view the possibly greater expense of capital and labor which succeeding and more extensive efforts will necessarily involve in this class of mining industry?

When these reflections are carefully applied to the mining interests here, they will raise to the surface something more than spasmodic efforts, silver divining rods, or presumptive theories. They would contrariwise naturally settle down and amalgamate into a solid and well-fixed purpose.

To Devise a Well Arranged System

To secure the most powerful and effective mechanical agencies, and to obtain the fullest amount of investment in capital and labor that could be employed to the highest advantage and with the greatest measure of success.

The lode interest here, of which the Comstock is by far the most important and productive, has been visited, as it were, by a storm, its surface treasures torn from its bosom and scattered to the four winds of heaven; and yet but few considerate mining men would, for a moment, hazard the opinion that these lodes have received more than a tenth part of the requisite attention toward their complete development, which their intrinsic merit justly demand.

Indeed, so small a part of the lode interest here, in comparison with the whole, has been explored that numerous and successive generations of people, at the present rate, will doubtless have to be assigned to this task of exploration and extraction. It is well known that quartz mining in this country was in an embryotic state when the Comstock lode began to startle the world with its immensity of mineral wealth. In fact, the history of this camp, and that of quartz mining in this county are, in the main, contemporaneous.

The Plants and Improvements Here

Are, in some measure, a collection from almost every mining zone of the civilized world, wrought up, modified and added to by the brightest and most expert mechanical genius of North America. The advancement has been steadily pushed forward, from the simplest horse-whim and the crudest Mexican arastras, to those stupendous plants known as the Norcross combination and the Union works, which, in the department of mechanics, are as startling objects to the eye of the spectator as are the Great Eastern or the dome of St. Peter's, in their sphere of architecture. Germany, Austria, France, England and the isles of the sea, have, each and all, sent up hither their latest improvements to aid in the various and diversified modes of ore extraction and ore reduction. Wherein one has failed, another has supplied the want, and wherein all have come short, the ever-ready and inventive talent of the American machinist has come to the relief of all, remodeling, and, oftentimes, creating anew the necessary machinery to carry forward the proposed work. Whatever wealth could purchase, or whatever genius could invent, has been lavished and poured out upon this mountain crest. To put this extensive, complicated and costly mechanism into successful operation none but the most gifted in practical engineering science and mining talent could ever have accomplished in its vast responsibilities or have surmounted its multifarious obstacles. Such work, performed by such workmen, is apt to be accounted of little note where the whole drift and rush has been, and still is, to secure the material plunder. The stately ship rides at anchor, the hurrying passengers disembark, a prosperous voyage has been concluded, and still but few are grateful to the watchful captain, or perhaps bestow a second thought upon the noble pilot at the wheel, who, with steady nerve and sleepless eye, has brought the frail craft in safety across the billowy seas. So here, as elsewhere, in all great undertakings, men have been found to meet the exigencies and the duties imposed upon them, and whilst others have reposed in conscious security of a day-dawn of prosperity awaiting them, these, with tireless vigilance and anxious concern, have paced the hurricane deck of the enterprise at all hours, and felt relieved only when the grand undertaking was accomplished. Whilst this famous camp has been

Prolific in Bonanza Ores,

It has been no less generous in its production of great and noble hearts, crowned by wise and sagacious heads. Whilst a multitude of the unworthy have grasped unearned and unmerited prizes and fled to remote districts of the earth, not a few are living, both here and elsewhere on these Pacific shores, whose names will ever be cherished by vast numbers, whose lives were so richly blessed, in consequence of their relations to this camp. Indeed, there have been and are still, kings, princes and nobles here, whose lives and manly integrity would not be seriously modified by carrying a brace of bonanzas in either pocket, and whose memory a grateful public will not willingly let die. To such, a mountain as lofty as Mount Davidson itself (named after Prof. George Davidson), towering 1500 feet above this city, would be but a feeble expression of respect due to the priceless character thus wrought out from this fiery furnace and crucible of mining industry during the past score of years.

Mineral and Metalliferous Veins.

EDITORS PRESS:—While perusing your interesting paper of January 2d, I noticed the letter from Mr. Chenoweth on mineral and metalliferous veins. Since then, however, I have been expecting to see a reply to it from some of your readers, but thus far none has appeared. The assertions made by Mr. Chenoweth are so unreasonable to me, that I cannot allow his letter to pass unheeded. Regarding mineral veins, Mr. Charles F. Blackburn said in a previous letter, which appeared in your issue of December 5th, that "fissures are usually caused by foldings or wrinklins of the earth's crust, produced by contraction of its interior." Now Mr. Chenoweth thinks it would be difficult for anyone to explain logically how such effects could be produced by the cause which Mr. Blackburn alleges. I think it is very easily explained. Professor Le Conte, who is considered an authority on this subject, fully explains the statement of Mr. Blackburn, in his excellent work on the Elements of Geology for 1879. On page 221 regarding fissures, the professor says: "Fissures are fractures in the earth's crust, passing through many strata, and even sometimes through many formations. The cause of fissures is evidently always movements and usually foldings or wrinklins of the earth's crust, produced probably by contraction of the interior portions, as will be explained under Mountain Chains."

On page 240, under the heading of Mountain Chains, the philosophy of this contraction is plainly shown; it reads as follows: "Mountain chains seem to be produced by the secular cooling, and therefore contraction of the earth, greater in the interior than the exterior. Or, to explain it more fully, by the greater interior contraction, the exterior crust is subjected to enormous lateral pressure, which crushes it together and swells it upward along certain lines, the strata by the pressure being at the same time thrown into more or less complex foldings, etc." The professor further says on page 245: "In consequence of the foldings we find associated with mountains, fissure veins, dikes, etc." Now if the above does not explain logically the cause of fissures as set forth by Mr. Blackburn, then I do not understand the English language. I could give more extracts from Le Conte, and cite other authorities in further explanation of this subject, but think by the time this letter is finished, I shall have encroached considerably upon your space. Nevertheless, Mr. Blackburn's assertion is the generally accepted theory as to the usual cause of fissures. In speaking of the filling of fissures Mr. Blackburn said: "Their contents have been deposited from hot alkaline waters, holding the various mineral substances in solution." To contradict this statement Mr. Chenoweth says: "At Steamboat springs, near Virginia City, there may be seen ocular disproof of the correctness of Mr. Blackburn's speculations. It may there be seen that at some time subsequent to the drift period there began a flow of hot springs at the summit of the western border of Shallow valley, the water of which, on cooling, formed a continuous rocky deposit of considerable length, parallel to the direction of the valley." Wonderful phenomena, indeed! This is, no doubt, great news to the scientific world. Just think of it! Mr. Chenoweth actually carries that the hot water of Shallow valley carries minerals, lime, etc., in solution, and upon cooling, these substances were really deposited and formed a continuous rock deposit. A most extraordinary discovery, to be sure. Will any of your readers kindly show me where Mr. Chenoweth's declaration disproves what Mr. Blackburn said regarding the filling of fissures? I would like very much to know where this "ocular disproof" of our present accepted theory of the formation of veins comes in. On the contrary, this attempted "ocular disproof" goes to show that precisely what Mr. Blackburn did say on the subject was true. Mr. Chenoweth then goes on to say: "In the course of time, as the accumulations extended over the soil toward the lower part of the valley, the weight became so great as to cause the soil on the outer edge to yield, and let the rock there sink, so as to produce fissures farther back, by fracture parallel with the direction of the valley." Now, I think Mr. Chenoweth talks wildly; his first statement about fissures is bad

enough, but this last attempt—well, it's really too bad. He writes as if he actually witnessed the sinking spectacle himself, and says positively that the weight became so great as to cause the soil on the outer edge to yield, etc.

Will Mr. Chenoweth please explain how a solid mass of earth, firmly supported, can yield to such a light weight on its top, without any interior contraction? There is about as much reason in saying 50 or 100 tons of rock placed on top of a solid cube of granite, 200 feet dimensions, would cause it to sink, break and form fissures. Mr. Chenoweth further says: "At this time the roaring of boiling waters may be heard deep down in these fissures, while steam is continually ascending through them to the surface, and being condensed on the sides of the fissures, produces a smooth white crystalline surface, entirely different in appearance from the matter which the same waters formed by sedimentary deposition." We are now told that the steam escaping from the hot waters of this heated interior is condensed on the side of the fissures, and produces a smooth, crystalline surface, entirely different from that formed by the same waters by the sedimentary deposition; that is to say, the steam and hot water, after dissolving out say limestone, comes up through fissures, and on coming in contact with their cooler sides condenses, and depositing the lime, forms a smooth, crystalline surface, unlike the sedimentary deposits of the same waters. In other words we are informed that a smooth lime surface, like the surface of stalactites, is different from sandstone. On the whole, Mr. Chenoweth's letter strongly shows that the fissures of Shallow valley were occasioned by contraction of the earth's interior, and in consequence the great weight on its top yielded, and sinking produced fissures. After the fissures were formed, the hot water, steam, etc., that came from a hot interior, dissolved out the lime, and possibly other minerals, and on coming in contact with the cooler sides of the fissures on its way up, deposited the lime, thus produced a smooth white crystalline surface. The same process is now going on in the Cave mine and stalactites are being formed; the waters, however, here are cold instead of hot, and as they contain more or less carbonic acid, the lime is easily dissolved, and afterwards by evaporation is deposited again in the most beautiful forms imaginable. Veins are also supposed to be usually formed by the same principle: that is by holding the minerals in solution and afterwards depositing them in the fissures. I, in conclusion, would say if Mr. Chenoweth thinks that Mr. Blackburn or any learned man on geology has the idea that veins are formed entirely by sedimentary deposition, he is badly mistaken. Sometimes I am inclined to believe that Mr. Chenoweth's letter was written for sarcasm more than anything else, because, in my opinion, he proves exactly the opposite of what he states.

Cave Mine, Utah.

A. A. GODEE.

BOILER INSPECTION.—The judiciary committee of the Board of Supervisors requested an opinion from the city and county attorney as to the power of the board to pass an ordinance appointing an inspector of steam boilers and regulating their use.

Attorney Love says: "I have grave doubts as to the power of the board to create officers and compensate officials in the absence of any permission given in, or that may be implied by our charter. But I would suggest that any ordinance to the effect proposed is unnecessary, in view of the statute still, in my opinion, governing the whole subject. By an Act entitled 'an Act for the appointment of inspector of stationary steam boilers and steam tanks and for the better security of the life and property in the city and county of San Francisco,' approved March 27, 1876, the Legislature made provision for the appointment and compensation of an inspector and for the inspection of boilers. That Act became and is a part of our Consolidation Act, and after the adoption of the Constitution of 1879 could not be repealed by any Act of the Legislature. Although on March 12, 1880, the Legislature passed an Act to repeal it (Statutes of 1880, page 28) in my opinion this repealing act was ineffectual, and the original Act remains in force as unassailable as the Act relating to the Police Commission, the city and county revenue, the public streets and the like."

DURING the last quarter, the Paradise Valley mine, of Nevada, worked 2,099 tons of ore, the gross yield of which was \$60,895.88, and the total cost of production was \$48,428.07, leaving a net profit of \$12,467.81.

A GERMAN carp, weighing twelve pounds, was caught by B. M. Fish in the Sacramento river, above Knight's Landing, on Saturday last.

NEGOTIATIONS are pending for the building of a mill on the gold ledge on the Big Copper mine, Lost River, Idaho.

NEW mines are reported some 15 miles west of Wm. Nichols' hay ranch, on the Austin road, Nevada.

THE Soda Lake district, San Bernardino county, is assuming great prominence, and two camps are lively.

THE mill recently erected at Lost Basin, Arizona, is working all right and turning out hullion.

MECHANICAL PROGRESS.

A NOVELTY IN NAIL-MAKING.—Mr. John Coyne, well known as the inventor of the nail self-feeder bearing his name, states that a new and improved method of manufacturing a semi-wire nail will soon be put in use in some of the Pittsburgh mills, which will revolutionize the nail manufacture. By this method semi-wire nails of square section, boat, barge, track and railroad spikes, as well as the common cut nails, can be made on the cut-nail machines now in use, without changing the manner of the operation. The improved cut nails will be of the same pattern and appearance of those now made, except that the inclined sides will be smooth and the parallel sides will be cut or rough surfaces, thus increasing the adhesive or holding power of the nails. Semi-wire nails made by this method will be of square section with four parallel sides and a chisel point, while the output will be at least three times that of the regular wire nail. The boat, barge, track and railroad spikes will have the same appearance as the most perfect now made from rods. The heads will not come off in the driving, by vibration or extraction, and any shape of head can be produced. In addition to the increase of output, it is estimated that the improvement will save at least four dollars per ton on the labor cost in manufacturing nails and spikes. The only change involved will be a modification in the process of rolling the plates. —*Progressive Age.*

TO TEMPER TOOLS.—This quality of the steel should be uniform throughout; indeed, it is always better to have them tempered rather too hard than soft, for use will reduce the temper. If at any time it is necessary to perform the operation yourself, the best method is to melt a sufficient quantity of lead to immerse the cutting part of the tool in. Having previously brightened its surface, plunge it into the melted lead for a few minutes till it gets sufficiently hot to melt a candle, with which rub its surface; then plunge it in again and keep it there till the steel assumes a straw color, but be careful not to let it turn blue. When that is the case, take it out, rub it again with the tallow, and let it cool. If it should be too soft, wipe the grease off, repeat the process without the tallow, and when it is sufficiently hot, plunge it into cold spring water, or water and vinegar mixed. By a proper attention to these directions, and a little practice every workman will have it in his power to give a proper temper to the tools he may use. If a saw is too hard, it may be tempered by the same means, but as it would be not only expensive, but in many cases impossible to do it at home, a plumber's shop is mostly at hand, where the process may be repeated when they are melting a pot of lead. But here observe that the temper necessary is different to other cutting tools; you must wait till the steel just begins to turn blue, which is a temper that will give it more elasticity, and at the same time sufficient hardness.

THE IRON FURNACES.—The January report of the condition of the pig-iron furnaces of the United States is very encouraging. It shows that there were in blast January 1st a total of 275 furnaces, with a capacity of 91,814 tons. Compared with the previous month's statement, it is shown that during December 25 furnaces have gone in blast—10 anthracite and 15 bituminous—while the increase in weekly capacity was 6848 tons. The improvement has been most noticeable since October 1st, at which time 75 anthracite furnaces, with a weekly capacity of 20,318 tons, and 88 bituminous furnaces, with a weekly capacity of 43,234 tons, were in blast. The number of anthracite furnaces in blast January 1st was 104, with a weekly capacity of 129,811 tons, and the number of bituminous furnaces in blast at the beginning of 1886 was 114, with a weekly capacity of 54,199 tons. The improvement in the iron industry during the last quarter of 1885 is thus seen to have been reflected in the going into blast of 29 anthracite and 26 bituminous furnaces, or a total of 55 furnaces, with a resulting increase in weekly capacity from 63,552 tons to 84,010 tons, or 32 per cent.

THE WORTHINGTON PUMP which was chosen by the British war office to supply the troops engaged in the late Suakin-Berber expeditions with water, by means of a pipe line from Suakin, has lately come into use as fire pumps in English mills and manufactories, in connection with an arrangement of automatic sprinkling pipes, which is fully described in *Engineering*, of November 13th.

In the same paper is found a notice that the American Elevator Company have been instructed to supply two of their lifts for passenger and goods to the hotel Bristol, in Paris, a compliment well deserved by an industry that has done much to make life in large cities comfortable.

FORMING SCREWS ON SHEET METAL PIPES.—The ordinary stove pipe has been a favorite theme for the exercise of harsh language ever since it was first invented. Most men imagine they have an average amount of scientific knowledge, at least enough to give them courage to tackle a stove pipe, but how many hearts have been made sad from this common conceit!

Now, it does require some mechanical knowledge and patience to put up a stove with the ordinary pipe, and not be found in a first-class swearing condition when the job is completed! The trouble with the ordinary pipe is that it is not suited to the average mental capacity of our race, and hence the trouble. And now a machine has recently been invented and patented for forming pipe with threaded end which will invariably fit, and can be put together and taken apart without the exercise of judgment above the ordinary.
